This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

GLU'TTON (*Gulo*), a genus of quadrupeds usually referred to the bear family (*Ursidæ*), but which constitutes an interesting connecting-link between that and the weasel family (*Mustelidæ*), agreeing more nearly with the latter in dentition, although approaching to the former in the plantigrade character. There are three false molars in the upper, and four in the lower jaw, anterior to the carnivorous tooth, which is large and sharp. The body is long, the legs are short, the feet have each five deeply divided toes, terminated by long curved claws. The tail is rather short, a fold beneath the tail supplies the place of the glandular pouch of the badgers; but when hard pressed by enemies, the gluttons emit a peculiar fluid of a strong musky odor. Their habits are nocturnal. The species commonly called GLUTTON, and also WOLVERENE (*G. arctieus*), is a native of the northern parts of Europe, Asia, and America. It is more common in the arctic regions than towards the southern limits of its distribution, which are about the forests of Courland, in Europe, and the mountainous parts of Massachusetts, in America. It is about two feet six inches or two feet nine inches in length, from the tip of the nose to the root of the tail; the tail about seven or eight inches long, both body and tail covered with long hair, under which the body is covered with a rich thick fur. The general color of the long hair is brown, sometimes approaching to black, lighter bands passing from the neck along the flanks, and meeting at the tail. The short fur is chesnut brown. The muzzle is black. A light-brown band runs across the forehead from ear to ear. The fur of the G. is sometimes of considerable value, and is used for muffs, cloaks, &c., but varies not a little in glossiness and other qualities. The most extraordinary stories were at one time credited concerning the ferocity, voracity, and cunning of this animal, and have not altogether disappeared from books of natural history. It is very capable of domestication, and even in a wild state exhibits no remarkable ferocity; nor is there any reason to believe that it leaps from trees on deer, or pursues any of those artful methods of procuring food which were once ascribed to it. It often preys on animals which it has not itself killed. The smaller quadrupeds are its principal food, and it devours young foxes in great numbers. Its speed is not great, but excels in strength and perseverance. The traps set for the smaller kinds of animals in the fur countries of North America are very often robbed by the wolverene, and it has been known to remove a great pile of wood, in order to get at provisions which had been hidden under it. Closely allied to the G. are the Grison and the Ratel. Bone-caverns and some of the newest deposits exhibit remains of more than one species of Glutton.

GLYCE'RIA. See MANNA GRASS.

GLY'CERINE ($C_6H_8O_6$), known also as hydrated oxide of lipyl, or hydrated oxide of glyceryl, was discovered by Scheele in 1779, who obtained it in the preparation of lead-plaster, and named it "the sweet principle of oils." It is a colorless, viscid, neutral, uncrystallisable, inodorous fluid, of a sweet taste, is soluble in water and alcohol in all proportions, but is nearly insoluble in ether. Its specific gravity at 59° is, according to Miller and most authorities, 1·28, but Gorup-Besanaz makes it as high as 1·97. At 40°, it becomes gummy and almost solid; at 212°, it is slightly volatile; but if distilled alone, the greater part of it becomes decomposed; it may, however, be distilled without alteration in a current of superheated steam which has been raised to a temperature of between 500° and 600°. By this means, Mr Wilson* has succeeded in separating heated fats into hydrated glycerine, and the acids with which it was previously in combination; the glycerine is thus obtained in a high state of concentration as a colorless, syrupy liquid, which can be thus prepared in unlimited quantity.

Glycerine forms soluble compounds with baryta, strontia, and lime; and it dissolves oxide of lead and numerous salts. Berthollet has found that glycerine, like Mannite (q. v.), is convertible into a true fermentable sugar, when digested with certain animal tissues.

Glycerine occurs ready formed in a few fats (as, for example, old palm-oil), and,

* The chemical superintendent at the works of Price's Patent Candle Company.

Digitized by Google

according to Pasteur, is contained in all fermented liquors, and especially in wine, its quantity amounting to three per cent. of the fermented sugar. It is a product of the saponification of the various fats, although it does not exist as glycerine, but rather as a substance having the composition represented by the formula $C_6H_5O_3$. According to Berthollet's view, glycerine is a triatomic alcohol, and may be represented by the formula $C_6H_5O_3,3HO$; and in the animal and in many vegetable fats, the three atoms of water are replaced by three atoms of the anhydrous fatty acid. Thus—

$$\text{Stearine} = C_6H_5O_3 + \overbrace{3C_{36}H_{35}O_3}^{\text{Stearic Acid.}},$$

$$\text{Palmitine} = C_6H_5O_3 + \overbrace{3C_{32}H_{31}O_3}^{\text{Palmitic Acid.}},$$

$$\text{and Oleine} = C_6H_5O_3 + \overbrace{3C_{36}H_{33}O_3}^{\text{Oleic Acid.}}.$$

In the saponification of these fats—that is to say, when they are treated with potash, soda, or oxide of lead, or under the influence of heated steam—the fatty acid separates from $C_6H_5O_3$, which assimilates three atoms of water, and becomes glycerine.

We have already referred to the best mode (Wilson's process) of obtaining glycerine on a large scale; the usual method of obtaining it on a small scale is from olive oil, which we saponify by treating it with an equal weight of oxide of lead (litharge), which is mixed with water, and added to the oil, with which it is boiled till the saponification is complete. The glycerine is dissolved by the water, and is easily separated from the insoluble lead-plaster (a mixture of oleate and palmitate of lead). Any traces of lead are removed by sulphuretted hydrogen, and the water is then expelled *in vacuo*, or over the water-bath. The former is preferable, as in the open air the glycerine becomes brown.

The uses of glycerine are numerous. In medicine, it is employed as a local application in diseases of the skin and of the ear; and it is used internally as a solvent for many drugs. It is a valuable preservative fluid for small and delicate anatomical preparations, and it has been applied to the preservation of meat. It has been added to the water in gas-meters, with the view of preventing it from freezing in winter, or from evaporating too rapidly in summer. It is used in the manufacture of copying-ink, and is of general application wherever a lubricating agent is required.

Many interesting researches have been carried on during the last few years regarding the true chemical nature and the artificial production of glycerine; they are, however, for the most part of a too purely chemical nature to be made intelligible to the general reader. We will merely remark that, like the alcohols in general, to which class glycerine is now assigned, it forms several classes or series of derivatives, the most important of which are its combinations with acids, forming *glycerides*, or compound ethers of glycerine, which are analogous in their composition to the various fats and oils. Berthollet has succeeded in forming these bodies synthetically, and has thus not only reproduced several of the natural fats, but has obtained a large class of similar bodies which were not previously known.

Treated with sulphuric acid, glycerine yields *sulphoglyceric acid* ($C_6H_8O_6,2SO_3$), and treated with phosphoric acid, it yields *phosphoglyceric acid* ($C_6H_8O_6.PO_5,HO$), a substance which occurs normally, in combination with soda and ammonia, in the brain and in the yolk of egg.

GLY'CINE, Gly'cocine, Gly'cocoll, or Sugar of Gelatine ($C_4H_5NO_4$), occurs in colorless, transparent, rhombic prisms, which have a sweet taste, and are devoid of odor. It is very soluble in water, the solution having no effect on vegetable colors, but is insoluble in alcohol and in ether. Glycine combines both with acids (as hydrochloric, nitric, sulphuric, and oxalic acid) and with metallic oxides, and the compounds in both cases are soluble and crystallisable; they are, however, of no great importance.

Digitized by Google

It is usually described as an animal base, but some chemists regard it as belonging to the class of bodies termed amido-acids, and as being amido-acetic acid; that is to say, acetic acid ($C_4H_4O_4$) in which one of the atoms of hydrogen is replaced by one atom of amidogen (NH_2). According to this view, its formula should be written $C_4H_3(NH_2)O_4$. Glycine is a product of various processes of decomposition of animal matters.

GLY'COGEN ($C_{12}H_{11}O_{11},HO$, according to the analysis of Pelouze) is a substance which in its properties seems intermediate between starch and dextrine. In contact with saliva, pancreatic juice, diastase, or with the blood or parenchyma of the liver, it is converted into glycose, and hence its name of glycogen. It occurs only in the cells of the liver, where it exists as an amorphous matter; but in the early stage of fœtal life, before the liver begins to discharge its functions, instead of being found in that organ, it exists in special cells in the fœtal structures known as the placenta and the amnion, and in the muscles, horny tissues, &c. In severe forms of disease, and especially in febrile affections, it seems to be temporarily absent from the liver. Its uses in the animal economy are noticed in the article LIVER.

GLYCOL is the type of a new class of artificial compounds, whose existence was inferred, and afterwards discovered, a few years ago, by Wurtz. In their chemical relation and properties, they form an intermediate series between the monobasic or monatomic alcohols, of which common alcohol is the type on the one hand, and the class of bodies of which ordinary glycerine is the type, on the other. The name of glycol, formed from the first syllable of glycerine and the last of alcohol, has been given to express this relation. According to the Theory of Types which is now commonly accepted (see TYPES, THEORY OF CHEMICAL), the glycols are termed diatomic alcohols, ordinary alcohol being a monatomic, and glycerine being a triatomic alcohol.

Ordinary glycol is formed from ethylene (C_4H_4), and hence it may be called ethyl-glycol, to distinguish it from propyl-glycol, which is formed from propylene (C_6H_6), from butyl-glycol, which is formed from butylene (C_8H_8), or from amyl-glycol, which is formed from amylene ($C_{10}H_{10}$).

Glycol is a colorless, slightly viscid fluid, with a sweet taste, and its composition is expressed by the formula $C_4H_6O_4$. For further information on this class of bodies, we must refer to any of the recent works on organic chemistry, or to a lecture on "Histoire générale des Glycols," delivered by Wurtz before the Chemical Society of Paris, and published in the "Leçons de Chimie professées en 1860," par MM. Pasteur, Cahours, Wurtz, &c., 1861.

GLYCO'SMIS, a genus of plants of the natural order *Aurantiaceæ*, trees, natives of the East Indies and the Mascarene Islands. The fruit of *G. citrifolia*, an East Indian species, is delicious.

GMELI'NA, a genus of trees of the natural order *Verbenaceæ*, having a small 4—5-toothed calyx, and a large, obliquely bell-shaped corolla. *G. arborea*, called GOOMBAR, or KOOMBAR, in India, is the most valuable for its timber. The tree attains a great size, and is widely diffused, both in Hindustan and the Eastern Peninsula. It has heart-shaped leaves and panniced flowers. The wood resembles teak, but is closer in grain, and lighter. It bears exposure to water better than most kinds of timber. It is used for many purposes, as for foundations of buildings, decks of boats, Venetian blinds, picture-frames, &c.

GMELIN, Leopold, a celebrated chemist, was born at Göttingen, in August 1788, and died at Heidelberg, in April 1853. His father was professor of natural history and botany at Tübingen, and afterwards of chemistry at Göttingen; and for at least four generations members of the Gmelin family have distinguished themselves in chemistry and natural history. After taking his degree in medicine, he spent several years at Tübingen, Vienna, and Naples, in the study of chemistry and mineralogy; and in the autumn of 1813, he began his public career as a teacher of chemistry at Heidelberg, where, twelve months afterwards, he was appointed extraordinary professor of chemistry. He discharged the duties of his office with unremitting zeal until 1848, when he had an attack of paralysis; and in 1850, in consequence of a second

Digitized by Google

attack, he was obliged to resign his professorial office. He published numerous contributions to chemistry and mineralogy in Schweigger's "Journal," Poggendorff's "Annalen," Liebig's "Annalen," and in Leonhard's "Jahrbuch," between the years 1815 and 1844. In 1820, he undertook, in conjunction with Tiedemann, a series of experiments on digestion; and in 1826, these philosophers published their celebrated work on this subject, under the title of "Die Verdauung nach Versuchen," in two volumes. "But" (Report of the Council of the Chemical Society for 1854) "the greatest service which Gmelin rendered to science—a service in which he surpassed all his predecessors and all his contemporaries—consists in this: that he collected and arranged in order all the facts that have been discovered in connection with chemistry. His 'Handbuch der Chemie' stands alone. Other writers on chemistry have indeed arranged large quantities of materials in systematic order, but for completeness and fidelity of collation, and consecutiveness of arrangement, Gmelin's 'Handbook' is unrivalled." The first edition of this great work appeared in 1817—1819, and included, in two vols. of moderate size, the whole extent of chemical knowledge as it then existed. The fourth and last appeared between the years 1843 and 1855, and extended to six vols., the last volume being edited, after G.'s death, by Schlossberger and List. An English translation of this edition (under the auspices of the Cavendish Society), with important additions by Mr Watts, the translator, was published in 1861.

GMÜND, a town of Würtemberg, in the circle of Jaxt, stands in a beautiful and highly cultivated district on the Rems, 29 miles east-north-east from Stuttgart. G. has important manufactures of *bijouterie* and hardware, and carries on spinning and stocking-weaving. Hops are produced in the neighborhood in great quantity. G. was formerly an imperial free city, and in the middle ages had a population of 18,000. It was added to the kingdom of Würtemberg in 1803. Pop. (1871) 10,789.

GNAPHA'LIUM. See CUDWEED.

GMU'NDEN, a town of the Austrian Empire, in Upper Austria, 32 miles south-west from Linz. It is situated at the lower extremity of the Traunsee or Gmundensee, the Lake of Traun or Gmunden, where the river Traun issues from it, in the midst of scenery at once extremely grand and beautiful. G. is a well-built town. It is connected by a branch-line with the railway between Linz and Salzburg. The salt-mines of the vicinity give occupation to many of the inhabitants, and the town is a chief station of the salt-trade. Steam-boats ply upon the lake Pop. (1869) 6062.

GNAT (*Culex*), a genus of dipterous insects, having the wings laid flat on the back when at rest; the antennæ thread-like, 14-jointed, feathery in the male, and hairy in the female; the mouth furnished with a long projecting proboscis, adapted for piercing the skin of animals and sucking their blood. They are said to feed also on vegetable juices. The species are numerous and abound in almost all parts of the world, particularly in marshy regions; and some of them, under the name of Mosquitoes (q. v.), are known in many countries as most annoying pests. An irritating fluid, injected through the proboscis, makes their punctures painful, and causes swelling. The proboscis of a gnat is an extremely interesting microscopical object. It is a membranous cylindrical tube, clothed with minute, feather-like scales, and terminated by two lips, which, when closed, form a kind of knob, and by six sharp bristles or very small lancets. The female gnats have the most powerful proboscis, and are the principal blood-suckers. Some persons are much more liable to the assaults of gnats than others. The flight of gnats is very swift, and the extremely rapid vibration of their wings causes the loud and sharp buzzing sound, which so often prevents sleep when even one of these insects has found its way into a bedroom on a summer night. The eggs of gnats are deposited on the surface of shallow, stagnant water, placed side by side, united by an unctuous matter, and fastened to the bottom by a thread, which prevents their floating away. They are soon hatched; indeed, a single summer sees several generations of gnats. The larvæ are to be seen in immense numbers in stagnant waters; they are of an elongated worm-like form; are destitute of feet, but swim and dive by means of fin-like organs; they feed on insects and also on vegetable substances; and often suspend themselves at the surface of the water, head downwards, for the purpose of respiration, by means of radiating bristles attached to a long

Digitized by Google

spiracle or tube at the caudal extremity of the body, by which air is admitted to the *tracheæ* or air-tubes. The pupæ also inhabit water, and are active; they remain almost constantly at the surface of the water, with the body recurved; and the respiratory openings of the air-tubes are now in the thorax.—The COMMON G. (*C. pipiens*) is of very wide geographic distribution. It is about three lines in length, brown, with whitish rings on the abdomen, the wings unspotted. It so abounds in some of the fenny parts of England that beds are occasionally surrounded with gauze curtains, as in India, on account of mosquitoes. It is extremely abundant in Lapland and Iceland.—A number of genera, allied to *Culex*, are united by many entomologists into a family called *Culicidæ*.

GNEISENEAU, August, Graf Neidhardt von, a distinguished Prussian general, was born at Schilda, in Prussian Saxony, in 1760. After serving in the Austrian army he accompanied the German auxiliaries of England to America. On his return he joined the Prussian army and gave proof of his military genius in his defence of Colbert. But his most distinguished service was his share in the Waterloo campaign, in which he was Blücher's chief of the staff, and principally directed the strategy of the Prussian army. He was made field-marshal in 1831, the year in which he died.

GNEISS, a term introduced from the German, as the name for a variety of Metamorphic rock, which has the same component materials as granite, and differs from it only in these materials being arranged in layers, rather than in an apparently confused aggregated mass. The minerals of which it is composed are quartz, felspar, and mica. The mica is sometimes replaced by hornblende, producing a gneiss corresponding to the variety of granite called Syenite. The different ingredients occur in various proportions, altering the character and appearance of the gneiss accordingly. It is often difficult to determine hand specimens of gneiss; for, on the one hand, they are sometimes so crystalline that they resemble granite, while, on the other, the schistose varieties approach so near to mica-schist, that even in the field, under the most favorable circumstances, it is not easy positively to separate them.

Gneiss was originally deposited as sand or mud, and has been converted into a hard tough crystalline rock by long and continuous subjection to metamorphic action, induced, perhaps, chiefly by heat. It has generally been considered as an azoic rock, that is, deposited before the existence of life on the globe. The older strata, classified by Logan under the title Laurentian, the equivalents of which have been recently observed by Murchison in Scotland, have as yet proved destitute of fossils, but this may be owing to the extreme metamorphism they have undergone. The Cambrian and Silurian strata of the north of Scotland have also been to a large extent converted into gneissose rocks, which contain intercalated with them fossiliferous limestones. It would seem, indeed, that gneiss and its allied stratified rocks are not necessarily "primary rocks," but may occur wherever an agency sufficiently powerful has acted upon ordinary sandstone and shale.

GNE'SEN, a small town of Prussia, is situated in a district abounding in hills and lakes, in the province of Posen, and thirty miles east-north-east of the town of that name. It was the earliest capital, and is said to be the oldest town of Poland. Pop. (1871) 9917.

GNETA'CEÆ. See SEA GRAPE.

GNOME (Gr. *gnomē*), a pithy and sententious saying, commonly in verse, embodying some moral sentiment or precept. The gnome belongs to the same generic class with the proverb; but it differs from a proverb in wanting that common and popular acceptance which stamps the proverb, as it were, with public authority. The use of gnomes prevailed among all the early nations, especially the Orientals; and the literatures, both sacred and profane, of most countries abound with them. In the Bible, the book of Proverbs, part of Ecclesiastes, and still more the apocryphal book of Ecclesiasticus, present, so far as regards language and structure, numberless illustrations of the highest form of this composition. The other books of the Old Testament contain many examples; and in the New Testament the familar lessons of our Lord are frequently presented in this striking form, which was peculiarly adapted to impress and move the classes whom he addressed. The Indian, the Arabian, and the Persian literatures also are rich in gnomes, as are those

Digitized by Google

of the northern nations. But the most interesting form which they have taken is that in which we find them in Greek literature, in which the writers who have cultivated this form of composition are known as a distinct class—the Gnomic Poets (*gnomikoi*). The Greek gnome is commonly couched in the elegiac distich; and the most celebrated gnomic poets were Solon, Theognis, Phocylides, Simonides, Tyrtæus, and Xenophanes of Colophon. The most remarkable of these is Theognis, whose gnomes extend to above 1900 lines. The remains of gnomic writers have been repeatedly edited under the title of "Gnomici Poetæ Græci," from the days of Melancthon downwards. The standard editions are those of Bekker (1815) and Welcker (1826). There is, moreover, a popular edition by Brunck, which is reprinted in the Tauchnitz Classics; and the gnomic poets are also commonly included in the collections of Minor Greek Poets.

In Latin literature, the "Disticha" of Dionysius Cato, the authorship of which has proved so fertile a source of controversy, may be mentioned as belonging to the class of gnomes.

GNOME, the name given in the cabalistic and mediæval mythology to one of the classes of imaginary beings which are supposed to be the presiding spirits in the mysterious operations of nature in the mineral and vegetable world. They have their dwelling within the earth, where they preside specially over its treasures, and are of both sexes, male and female. The former are often represented in the form of misshapen dwarfs, of whom the well-known "Rübezahl," or "Number-nip," of German legend is a familiar example. Pope, in the "Rape of the Lock," and Darwin, in the "Loves of the Plants," have drawn upon the more pleasing associations of this curious branch of mythology. See ELEMENTAL SPIRITS.

GNO'MON. When a rectangle is divided into four parts by cross lines parallel to its sides, the sum of any three of the parts is called the *gnomon*. See Euclid, b. ii. prop. 5, and seq.—Gnomon has also a meaning in Dialling (q. v.).

GNOMO'NIC PROJECTION. See PROJECTIONS.

GNO'STICS from (Gr. *Gnōsis*, knowledge), the collective term for a number of early Christian sects which were known besides—with one insignificant exception—by special names derived from their respective founders. The word gnosis, when first applied to revealed religion, in many passages both of the Septuagint for the Hebr. *Déah*) and the New Testament, expressed a full and comprehensive acquaintance with, and insight into, the received laws and tenets, ritual and ethical, and was consequently praised as a desirable acquirement: by St Paul even called a special gift (*Charisma*) (1 Cor. xii. 8, &c.). Gradually, however, there was—first by the Judæo-Alexandrine schools—ingrafted upon it a meaning more akin to that in which it was occasionally used by Pythagoras and Plato; it designated a knowledge of certain mysteries, which lay hidden beneath the letter of the religious records, and could be received only by a few superior minds, while the multitude had to be satisfied with the outward apparent meaning. The remarkable form of Christianity to which the word in this sense was applied, as a religious phenomenon as extraordinary as were the times and causes that gave it birth. Rome had conquered well-nigh the whole of the then known civilised world, and within her vast dominions the barriers, which had hitherto separated the multifarious nations of east and west, were broken down. From the remotest corners of the empire philosophers and priests, scholars and teachers, flocked to Rome, to Athens, to Alexandria, and communicated to each other, discussed, and frequently amalgamated their widely differing creeds and systems to such a degree that the former national or personal individuality of opinion was almost effaced, making room either for a vacillating indecision, or at the best a shadowy and passive eclecticism. And while, on the one hand, Greek philosophy, which formed a principal part of the education of the higher classes, had become almost exclusively a Platonism, sliding into overt scepticism; on the other hand, the naturalisation in the Roman empire of a promiscuous Pantheon, whose gods were gathered from Egypt, Greece, Persia, India, and countries still more remote, had at length produced, out of an unparalleled mixture of religious ideas and fancies, a superstition so abject and unnatural, that it too, at last, was ready to give place to despairing unbelief. Judaism, again, had outlived its political existence, and began to assert itself as a

Digitized by Google

Gnomes
Gnostics

faith, independent of any state or dominion of its own, divided, however, into different schools, according to the more or less strict adherence to the letter of its written and oral laws. Nay, the influence of Hellenism had, among the Alexandrines, produced such effect that, of the living body of Judaism, little remained but a skeleton framework, round which allegory and symbol had woven their fantastic fabric. Christianity, as yet not clearly defined, swept all the more irresistibly over the regions from the Euphrates to the Ganges, the Nile to the Tiber, as it offered a code of morals sublime and yet simple, a faith human and withal divine, superior to any of the abstruse and exploded Polytheisms, to a world agitated to its lowest depths, and yearning for some new and more satisfying doctrine; while, at the same time, it denounced the stringent and severe ritual tenets of its mother-religion, Judaism, as inconsistent with the freedom of the human mind. Yet it was not to be expected that the old pagan creeds and the old philosophies would expire without a struggle. They made a last stand, and produced in their and the ancient world's dying hour Gnosticism. It sprang suddenly out of a monstrous chaos, a consummate religious eclecticism, bold, consistent, to a certain degree even sublime. The wildly opposite ideas of Polytheism, Pantheism, Monotheism, the most recondite philosophical systems of Aristotle, Plato, Pythagoras, Heraclitus, Empedocles, &c., together with the awe-striking Mysticism and Demonology which after the Babylonian captivity had created, in the very heart of Judaism, that stupendous and pre-eminently anti-Jewish science of Cabbala (q. v.)—all, it would appear, had waited to add something of their own to the new faith, which could not hold its own under all these strange influences. An open attack was no longer of any use; so, assuming the garb of the enemy, they sought to carry destruction into the centre of the hostile camp. Moreover, an aristocracy of mind, powerful and numerous as none had ever been before, could not but, even when it had outwardly assumed the new religion, loathe the thought of sharing it completely and unreservedly with the herd of freed and unfreed slaves around them, with the low and the poor in spirit; and the exclusiveness of Gnosticism was undoubtedly, next to the fascination of its dogmas, one of the chief reasons of its extraordinarily rapid propagation.

We have stated at the outset, that Gnosticism was but a general name for a great number of diverging Christian schools. But all these had some fundamental points in common, which we will attempt to specify briefly, as far as the fragmentary and adulterated nature of the evidence will permit; for unluckily, all we know of the G., we know from their Jewish and Christian adversaries, who confessedly took especial pride in representing them and their belief in their darkest hues.

There is a Divine Being, whose essence is love, grace, and mercy. He is enthroned in the highest height, enclosed in an abyss (*Buthos*). He is the sum of being, He is silence, abstraction, incomprehensible, for human minds almost non-existing (*Ouk On*). The Mosaic Cosmogony has not seemingly, they said, brought us one step nearer to the solution of the problem of the creation. Out of nothing, nothing can come, notwithstanding a Divine Fiat; for God can, through his spiritual nature, have no connection whatever with corporeal things, and he could not have originally *made* them. They, therefore, assumed a pre-existing *matter* (*Hyle*), out of which the universe was merely *formed*. A corroboration for this opinion was found—according to the peculiar Gnostic mode of interpretation—in the two adjectives *Tohu vabohu* (without form and void) (Gen. i. 2), applied to the earth, and which were by them interpreted as substantives (Kenoma, Kenon) intended to express the original substance of the universe (Cf. Gen. Rab. i.). Between this Hyle, or visible world, however, which was either represented as the darkness or shadow alongside the divine light, as a sluggish, stagnant mass, or as a turbulent, active kingdom of evil; and that supreme incomprehensible Being, whose goodness could have nothing to do with the evils of the world, no more than his perfection with its defects and misery, there existed a *Plerôma*, or fullness of Light. In this fulness dwelt embodied attributes of Divinity, the abstract ideas of Wisdom, Justice, Right, Power, Truth, Peace, and many more which had emanated or flowed out (in pairs, as some held, male and female) from the supreme central point, as rays innumerable flow out of the sun, as countless numbers from one unit, as echoes from a sound, or as, primarily, all the founts and rivers arise from the waters below. At the head of these emanations or Æons (Everlasting ones—like their source) which, descending lower and lower, form a link be-

Digitized by Google

tween heaven and earth, stands the Nous; and one of the lowest Æons is the *Demiurgos*. He is the real framer and master of the visible world, and partakes to a certain degree of its nature. On the nature of this Demiurgos (Jaldabaoth, Archon), however, the two principal divisions of Gnosticism, which might be termed Judæo-Alexandrine and Syrian respectively, widely differed. The former took him as the representative and organ of the highest God. It was he who had been put by the divine will over Israel, especially under the name of Jehovah. As other, though inferior, angels presided over the destinies of other nations, so this higher Æon had to protect the peculiar people of God. It was he, therefore, who revealed himself—he who gave the laws—he who sent the prophets. But in all this he acted rather as an unconscious medium; he was no more able to comprehend the full meaning of the ideas revealed through him in the Old Testament, than he understood the scope and significance of the creation. His principal attributes are justice and severity, which, carried out with stern consistency, become cruelty. These G. distinguished also among the Jews themselves, those "after the flesh" who, confounding the likeness with the original, the symbol with the idea, took the Demiurgos to be the supreme God, and those "after the Spirit," or Israelites indeed—the privileged few who, divining at least the veiled ideas of the supreme God, needed no such education by fear or hope, punishment or reward, at the hands of the Demiurgos, but rose above him in understanding and conception of things human and divine. The other principal party of the G., however, the Syrian, under the influence of the Parsic (Zoroastrian) Dualism, so far from considering the Demiurgos as an instrument of divinity, willing but poor in intellect, looked upon him rather as a rival, and consequently conflicting power. He is the primary evil opposed to the primary good. The divine germs which, according to both parties, had been communicated through the lowest emanations in their downward course to matter and to mankind, the Demiurgos of the Alexandrians had not known how to develop in a proper manner, but had weakened, sometimes neutralised them from want of knowledge, thus engendering all earthly sin and misery *against* his will, while the Syrian Demiurge spitefully and maliciously stifled these germs in order to wrest the power over the world from the Divine Being altogether. His base, revengeful, and withal limited nature, they said, is full and clearly stamped upon the Old Testament—exclusively his work.

Man—in this all the schools were agreed—was divided into three classes, corresponding more or less to these predominant powers of the world: Divinity, Matter, and Demiurgos. There were first the spiritual men or *Pneumatikoi*, inspired by the highest God, striving towards him, with him; initiated into his counsels, understanding his essence. They were free from the yoke of law, for terrestrial nature had no power over them; they were the prophets, guiding, but not guided; the possessors of the true Gnosis. Diametrically opposed to these, as was Hyle to divinity, are the terrestrial men, *Sarkikoi* or *Choiks*—of the earth earthy—who are tied and bound by matter; they can neither aspire to the height of spiritual men, nor are they to be ruled by the precepts of law. Between these stand the *Psychikoi*, the blind servants of the lawgiving Demiurgos, who are, through the restraints put upon them by his either stupid or spiteful precepts, free to a certain degree from the terrestrial powers, but they can never reach the height in which the pneumatics habitually dwell. And again, corresponding to these three classes of men, there were three principal religions; Christianity above, Heathenism below, Judaism in the intermediate space.

The two leading tendencies of Gnosticism, of which we have spoken, also manifested themselves, accordingly, in the view they each took of the person of Christ himself. According to both, he was the highest Æon, suddenly sent down by the Supreme Being, to rescue and reclaim certain higher natures—for the lowest stratum of men, the carnal or terrestrial, was irredeemably lost—which had either been led astray by the Demiurgos, or had become entangled in the net of matter. At the same time the harmonious combination of the human and divine in Christ, which the New Testament assumed, stood in direct opposition to the very basis of Gnosticism. The Visible and the Invisible, the Finite and the Infinite, God and Man, cannot combine: in this they all agreed. But while the Judaising schools divided Christ into two distinct persons, one of heaven and one of earth, who had only become one at the baptism in the Jordan, and who had separated at the crucifixion;

Digitized by Google

the other oriental section of Gnostics held that Christ's earthly manifestation in the flesh, that his whole humanity, was a mere shadow or delusion.

It might well be asked, how with this extraordinary conglomeration of Monotheism, Pantheism, Spiritualism, and Materialism, the G. could possibly take their stand on the Bible, which, from first to last, it would seem, denounces, and in the strongest manner, doctrines such as the foregoing. The only answer to this is, that they, and they only, were the Pneumatikoi—the Initiated. It was well for the other portions of mankind, the natural men, to take everything, including Scripture, and its historical as well as its dogmatical parts, literally. As in creation, so in the book; the G., guided by their inner lights, saw beneath the surface, and saw everywhere, the most complete affirmation of their peculiar ideas. If the Midrash (q. v.) gave the most fanciful and allegorical interpretations of the Old Testament, for the sake of inculcating moral principles, for edifying, elevating, comforting the congregation, but without the faintest pretence that any but the fixed traditional interpretation was binding and authoritative—Gnosticism, with a proud contempt of the laws of language and thought, did the same for its own purposes, but made its wildly symbolical and erratic interpretations of the religious records binding. We are far from saying that they were in all cases guilty of intentional deception in the ordinary sense of the word; although they must frequently have known the real meaning to be totally opposed to their explanations, as most of their teachers were learned Jews; but they like other enthusiasts, gradually lost the power of discriminating between that which was, and that which might be. Some, however, more consistent, assumed that Christ and his apostles had still been partially under the influence of the Demiurgos, and also that what they had taught, they had expressed in accordance with the blindness of those whom they addressed. Proceeding consistently, they by degrees excluded from the code most of the books of the New Testament, especially those in which there were distinct attacks against themselves; and substituted a number of other epistles and religious documents of their own in Greek and Syriac, such as the "Prophecies of Cain," "Writings of Pachur," "Psalms" by Valentinus and Bardesanes, "Gnostic Hymns" by Marcos, "Books of Adam, Enoch, Moseh, Elias, Isajah," &c., not to mention a host of writings by newly invented prophets of such peculiar names as Pachor, Barkor, Armagil, Barbelon, Balsamum, Lensiboras, &c. (Hier. ad Theod. iii. 6, &c.).

Practically, Gnosticism influenced the lives of its adherents in two totally distinct ways: according to the view they took of the nature and office of the Hyle and Demiurgos. The Hellenising Gnostics, striving to free themselves as much as in them lay from their stupid and degrading bonds, became ascetics, austere, rigid, and uncompromising. The oriental view, however, of the dualistic and antagonistic powers of light and darkness, good and evil, which was adopted by the other portion of the G., led them, on the other hand, to the practice of the grossest sensuality, in token, they said, of their utter contempt for matter, and still more for the Demiurgos—Body, and its enjoyments; everything terrestrial, in short, had as little to do with their mind, which was one with the Supreme Deity, as had matter with God. Transgression there was none, because there was no law; there could be no law for them who were better even than the angels—who were subject to none: a distortion of a dictum in the "Midrash," that "the law was not given to angels, but to mortal men," and was therefore to be administered leniently. They, indeed, knew not how to express to the full their utter contempt for this Jewish Jehovah, or Demiurgos. There were others among them who called themselves after the serpent (*Ophites*), which by tempting Eve brought into the world the blessing of knowledge, and had thus become its greatest benefactor. Others took the name of *Cainites* (*Balamites*), contending that Cain had been the primeval representative of Gnosis, as opposed to the *Pistis*, or blind unreasoning faith of Abel, the representative of the *Psychikoi* (the Jews)—Seth being the type of the *Pneumatikoi*. Another class of similar tendencies styled themselves simply *Antitacts* (opponents to the Law), a name indicative of their readiness to take under their especial protection, not only all those persons condemned in the Biblical records, but all the offences prohibited in them.

It is as hopeless a task to follow the development of this metaphysical and unique abnormity called Gnosticism, of which we have attempted here to give a faint outline, through the bewildering maze of its ramifications from its beginning in history to its final disappearance, as it would be to fully trace its component parts to their

Digitized by Google

original sources. It sprang up in the first c., it had spread over the whole civilised world in the second, and it was fiercely and unremittingly combated from the second to the sixth c. by Judaism, Platonism, Neo-Platonism, and, above all, by Christianity. With respect to the relation of the Gnostics to the orthodox church, however, we must observe that they all the while feigned a naïve surprise at not being fully recognised as most faithful followers of Christianity, and members of the large Christian body. All they aspired to, they said, was to be allowed to form a small central circle within the large outer circle, to be a kind of theosophic community, consisting of the more advanced members of the church; indeed, they not only adhered, for the most part, to the outward forms of Christian worship, but occasionally even surpassed it in pomp and splendor. And such was the fascination Gnosticism exercised over the minds, that, had it not been for the innumerable schisms in its own camp, which prevented its alliance with the political power of the day, it would have stood its ground much longer. On its influence upon the Judaism of its time, as it is recognisable in many passages of contemporaneous Jewish literature; on its lasting influence upon Christianity; and on its frequent revivals in the middle and modern centuries, we can as little dwell here as on its embodiments in many philosophical systems, ancient and modern.

We can only take, in conclusion, a cursory glance over some of its principal schools, in giving a brief list of their founders (of whom, and their chief doctrines, special notices will be found), and the places where they flourished, without attempting to divide them minutely, as has been done in different ways, by Neander, Gieseler, Matter, Baur, Schaff, into Judaising and Christianising; speculative, practical and antinomian; dualistic and emanationistic; or to classify them strictly by origin and locality. Suffice it to mention, that among the precursors of Gnosticism are recorded some half-mythical personages, such as Euphrates, mentioned cursorily by Origen; Simon Magus, whose history, as given in the Acts, has been made the ground-work of innumerable legends; Menander, his successor; Cerinthus, the apostle of the Millennium; and Nicolaus, the father of the pre-eminently immoral sect of the Nicolaitans. Founders of special schools were, in Syria, Saturninus of Antioch, about 125 A.D. under Hadrian; Bardesanes of Edessa, 161 A.D., the author of many hymns, and who looked upon the Holy Ghost as at once wife and sister of Christ; Harmodius and Marinus, his disciples; Tatian of Rome, the founder of "Encratites," who wrote a still extant "Oration to the Greeks." Of Egyptian founders of Gnostic schools we may mention Basilides of Alexandria (125—140), who assumed 365 æons or circles of creation, two Demiurgi, and a threefold Christ, and whose mystic use of numbers and names reminds us most strikingly of the Cabalistic "Geometria;" his no less famous son and follower, Isidorus, the author of a system of ethics; and Valentinus of Rome, who died 160 A.D. at Cyprus, a Jew—as indeed was Markos his disciple, and, very likely, Basilides and Jaherinus. Of Valentin's successors who founded schools of their own, are mentioned besides Markos, Secundus, Ptolemy, Colarbasus, Heracleon, Theodorus, and Alexander. To the Syrians may also be reckoned the Ophites, Cainites, and Sethites (see above). In Asia Minor, we have Marcion about the middle of the second c., who is rather remarkable for his consistency in scornfully rejecting the whole of the Old Testament and all apostolic authority save Paul. His school flourished up to a very late period. Among non-localised G. may be enumerated the schools of Carpocrates and Epiphanes, the Bartonians, Antitacts (see above), Philonites, Archontics, and a great many others.

GNU (*Catoblepas*), a genus of ruminant quadrupeds, which naturalists generally rank with the antelope family (*Antilopidæ*), but which some place in the ox family

Digitized by Google

(*Bovidæ*), and of which the best-known species has been often described as apparently made up of parts of different animals, not only of the antelope and the ox or buffalo, but even of the horse. This species (*C. Gnu* or *Antelope Gnu*) is a native of South Africa; it has disappeared from the more settled parts of Cape Colony, but is to be seen in herds on the arid plains beyond these boundaries in company with the zebra or the quagga, and with flocks of ostriches. The form and action of gnus so much resemble those of zebras and quaggas, that at a distance they may be readily mistaken for them. The size of the gnu is that of a large ass; the general color is yellowish tawny. Both sexes have horns. The limbs are slender, like those of deer and antelopes. The gnu gallops with great speed. It has been usually represented as a very fierce animal, and certainly shews much ability to defend itself with its horns, when unable to escape from danger by flight; but when taken young, it is easily tamed, and readily associates with oxen, accompanying them to and from the field. There are two or three species, all South African, nearly resembling the common gnu, and one of them at least is very considerably larger. Their flesh is said to be palatable.

GO'A, a city of Hindustan, on the Malabar coast, in lat. 15° 30′ n., and long. 74° e., while the dependent territory of the same name stretches in n. lat. from 14° 54′ to 15° 45′, and in e. long. from 73° 45′ to 74° 26′, containing 1066 square miles, and 420,000 inhabitants. G. was once the capital of the Portuguese dominions in India, but is now in a state of hopeless decay. It was valuable chiefly on account of its harbor, one of the best on the west coast of Hindustan, from which it was about 5 miles distant; but having the misfortune to be ravaged by the cholera in the beginning of the 18th c., most of the Portuguese left it, and settled nearer the sea, at Panjim or New Goa, which is the present seat of government, with a population of about 24,000. The inhabitants of the old city are almost entirely ecclesiastics, the place being the see of an archbishop, the primate of the Portuguese Indies. G. was conquered by Albuquerque in 1503, at which time it was inhabited by an Arabic people.

GOALPA'RA, a district of British India, in the chief-commissionership of Assam (though not recognised as part of Assam till 1874), stretches in n. lat. from 25° 40′ to 26° 31′, and in e. long. from 89° 42′ to 91° 8′, containing 4433 square miles, and (1872) 444,761 inhabitants. On the n. it is bounded by the native state of Bhotan. Its capital, of its own name, stands on the river Brahmaputra, in lat. 26° 8′ n., and long. 90° 40′ e.

GOAT (*Capra*), a genus of ruminant quadrupeds of the family *Capridæ* (q. v.), so closely allied to the sheep that it is not easy exactly to define the distinction, although the common domestic goat and sheep are of widely different appearance. One of the most marked of the distinguishing characters is, that the horns of goats are directed upwards, backwards, and outwards, whilst those of sheep are more or less spirally twisted. Another character is the beard on the chin of the male goats, which is wanting in the sheep; but these characters are not perfectly constant. Perhaps a more constant character is the straight line of the face in goats, as compared with the arched line in sheep. The tail of goats is also much shorter than that of sheep. A curious but constant mark of distinction is the want of a small pit, producing a fatty secretion between the toes, in goats, which exists in sheep, and is peculiar to them. And another constant mark is the strong smell of male goats, particulary during the rutting season, which is wanting in sheep. Equally constant are the differences of temper and manners, goats being in a high degree curious and confident, and the very term *capricious* referring to their exhibition of the quality which it denotes. In both goats and sheep, both sexes are usually furnished with horns, the want of which is a variation apparently caused by domestication, and is most frequent in females. The horns and beard of female goats are always smaller than those of the male. Some goats have horns three feet long.

Goats are found wild only in mountainous countries; they all exhibit a great aptitude for scrambling among rocks and bushes, are extremely sure-footed on narrow ledges and pinnacles, and display great strength and agility in leaping. They also prefer as food the leaves and small branches of shrubs, and the strongly aromatic herbs which abound in mountainous situations, to the herbage of the richest

Digitized by Google

pastures. The Greeks and Romans sacrificed the goat to Bacchus, as an enemy of the vine. It is difficult in this genus to determine what are species and what are varieties. The Common or Domestic Goat (*C. hircus*) has existed as a domestic animal from the earliest ages; it is frequently mentioned in the books of Moses, and formed a large portion of the flocks of the patriarchs. It adapts itself to almost all climates, and thrives under the care of man in the hottest parts of India and Africa, and with the protection only of a shed from the severity of winter, in the northern districts of Scandinavia. Amidst such diversity of circumstances, considerable diversity of breeds might be expected, and accordingly besides the variety common in Britain, there are the Syrian Goat, the Angora (q. v.) Goat, the Cashmere (q. v.) Goat, all remarkable for the greater length and fineness of their hair; a beautiful dwarf variety from West Africa, called the Guinea Goat, and many others. Some of these, as the Syrian goat, have large pendent ears. In nothing does variation seem more readily to result from the influence of climate and other circumstances, than in the quantity and quality of the hair, and in the relative abundance of the two kinds of it, both of which are well exhibited in the common goat, the long soft hair, and the softer woolly hair beneath it. But in many other respects, also, the domestic goat is subject to variation, more than perhaps any other domestic quadruped except the dog.

Goats can be kept with advantage in situations too rocky, or where the herbage is too scanty for oxen or sheep. They were formerly kept in greater numbers in Britain than they now are. On some of the mountains of Wales and of Scotland, the goat is almost as completely wild as if it were indigenous, and even to get within shot of it is difficult. It is capable, however, of the most perfect domestication, and becomes extremely attached and familiar. It is apt, indeed, to prove a troublesome pet, and makes use of its horns, although not angrily, much more freely than is at all agreeable.

The uses of the goat are numerous. The flesh is good; that of the kid, or young goat, is in most countries esteemed a delicacy. The milk is very rich and nutritious, more easy of digestion than that of the cow, and it is often useful to consumptive patients. Some goats yield as much as four quarts of milk daily, although the average quantity is more nearly two. Both cheese and butter are made of goats' milk; they have a peculiar but not disagreeable flavor. Goats' milk is still very much used in Syria and other parts of the East, as it was in the days of the patriarchs. The skin of the goat was early used for clothing, and is now dressed as leather for many uses, particularly for making gloves and the finer kinds of shoes. The hair, which may be advantageously clipped annually, is used for making ropes which are indestructible in water, and for making wigs for judges, barristers, and ecclesiastical dignitaries. For the latter purpose, the hair of white goats is used. The use of the hair or wool of certain varieties of goat for making valuable fabrics is noticed in the articles ANGORA and CASHMERE GOAT. The horns are used for making knife-handles, &c., and the fat is said to be superior to that of the ox for candles. In Holland, goats are employed in drawing children's coaches, to which as many as four are sometimes harnessed together, and they are sufficiently tractable and obedient to the rein.

The goat generally produces two young ones at a time. A hybrid between the goat and the sheep has been produced, and it has been described as fertile, but there is no evidence of fertility except in connection with one of the parent races.

The origin of the domestic goat is with greatest probability traced to the AEGAGRUS (*C. Aegagrus*), which many naturalists confidently identify with it, and which is found on Caucasus and on many of the mountains of Asia. It is called *Paseng* in Persia. Its legs are longer than those of the domestic goat; its horns are very large, larger in proportion than those of any other known ruminant. Another wild species is the JEMLAH GOAT (*C. Jemlaica*), which inhabits the district of Jemlah, between the sources of the Sargew and the Sanpoo, the most elevated range of Central Asia; very similar to which, if really distinct, is the JAHRAL (*C. Jahral*) of Nepal. These, however, have no true beard, although they otherwise abound in long hair. Other species or varieties of goat, of which the BOUQUETIN (q. v.) is one, are associated under the name IBEX (q. v.). All the species are natives of the Old World.

GOAT, Rocky Mountain (*Antilope lanigera* or *Aplocerus lanigera*), an animal of the antelope family, inhabiting the lofty peaks of the Rocky Mountains of North

Digitized by Google

America, from about the 40th to the 65th degree of latitude. Its size is about that of an ordinary sheep, and its general appearance is not unlike that of a sheep of the Merino breed, its long straight hair hanging down in an abundant white fleece. The flesh is in little esteem as food, having a musky odor. This animal has been called the *Sheep Antelope* and the *Wool-bearing Antelope*. It has been thought that its fleece might be available for some of the finer kinds of manufactures, and that it might be introduced with hope of advantage into the Highlands of Scotland.

GOAT-MOTH (*Cossus ligniperda*), a lepidopterous insect of the same family with the Ghost-moth, *Hepialidæ*. The genus *Cossus* has long antennæ; a large body, a very small head; the upper wings larger and longer than the lower. The larvæ feed on the wood of trees, and the pupæ are enclosed in cocoons, made chiefly of the saw-dust which the mandibles of the larvæ have produced. The G. is one of the largest of British moths, measuring from 3 to 3½ inches from tip to tip of its expanded wings. It is of a gray color, the upper wings mottled with white, and marked with many irregular black lines, the lower wings of an almost uniform brownish ash color. The larva is about 3 inches long when full grown, yellowish, the upper parts pink, the head black. The larva inhabits and feeds on the wood of willows, poplars, and elms, making holes large enough to admit the finger, and often causing the destruction of trees. It emits, when alarmed or handled, a peculiar and disagreeable goat-like odor, which cannot be removed from the hands even by frequent washings. The larva takes three years to come to maturity.

GOAT'S-BEARD. See SALSAFY.

GOAT'S RUE (*Galega*), a genus of plants of the natural order *Leguminosæ*, suborder *Papilionaceæ*, of which one species (*G. officinalis*), a perennial herbaceous plant, about three feet in height, with pinnate leaves, long pointed leaflets, racemes of generally purplish or pink-colored flowers, and upright nearly cylindrical pods, has been recommended for cultivation in Britain as a forage plant, on account of the great bulk of produce which it yields. It has, however, a peculiar smell, and is not relished by cattle unaccustomed to it. It is a native of the south of Europe.

GOA'TSUCKER (*Caprimulgus*), a genus of birds of the family *Caprimulgidæ* (q. v.), having the upper mandible curved at the point, and furnished along each margin with a row of strong hairs or bristles (*vibrissæ*) directed forwards; the hind toe capable of being directed forwards; the claws short, except that of the middle toe, which is remarkably long, and serrated on its inner edge, so as to form a kind of comb attached to the toe. Although the bill is very short and weak, the gape is extremely wide, as if the head itself were divided. The goatsuckers feed on insects, perhaps chiefly on moths, whence they are called *Moth-hunters*, and pursue their prey either in the evening twilight or during the night, in a manner similar to bats and swallows. Like them, they seem to confine themselves very much to a limited space, in which they often pass and repass at no great height above the ground. They have great rapidity and power of flight. Of course, their great width of gape is favorable for the capture of insects. Goatsuckers are birds of light, soft plumage, in general minutely mottled with gray and brown. One species alone is found in Britain, the COMMON G. or EUROPEAN G. (*C. Europæus*), also called the Night-Churr, or NIGHT-JAR, from the sound which it produces; and not unfrequently, from the resemblance of its plumage to that of owls, the CHURN OWL or FERN OWL. It is a summer visitant of Britain, coming very late, and departing generally very early; it is more common in England than in Scotland, although its migrations extend northward to Scandinavia, Siberia, and Kamtchatka. In winter, it retires from Europe altogether, passing to the south of the Mediterranean. It often haunts bushy places and grounds covered with brake. It scarcely makes a nest, but deposits two eggs in a depression of the ground, under shelter of a bush. Its whole length is about ten inches and a half. This bird is the *Caprimulgus* of Pliny, the *Aigothelas* of Aristotle, both these names being exactly equivalent to the English G., and expressive of the ancient and long entertained popular notion, that this bird sucks the teats of goats, a notion probably founded on the habit—which, at all events, has been observed in some of this family—of hunting insects under the bellies of grazing cattle. In perching, the G. sits *lengthwise* on the branch. Species are widely distributed over the world.

GOBBE, or Voandzou (*Voandzeia subterranea*), an annual plant, allied to the kid-

Digitized by Google

ney-bean, but of which the pod is thrust into the ground in the same manner as that of the Ground-nut (*Arachis hypogœa*, see ARACHIS), to ripen the seeds there. It is a native of the north-east of South America, and of some parts of the west of Africa. Its seeds are used as food, being wholesome and agreeable when boiled.

GO'BBO, Gobbio, or Gombo. See HIBISCUS.

GO'BELINS. See TAPESTRY.

GOBI, Desert of. See SHAMO.

GO'BLINS AND BOGLES, familiar demons of popular superstition, in Fr. *gobelin*, Ger. *kobold*, Gr. *kobalos*, a spirit which lurks about houses. It is also called hob-goblin, perhaps a corruption of hopgoblin. Some have derived the word goblin from the French *gober*, to swallow, to devour; and others the words elf and goblin from the Guelphs and Ghibellines, each name being used by the other party as a name of terror. Goblin is used in a serious sense by Shakspeare in "Hamlet," where the ghost is supposed to be a "spirit of health or goblin damned." *Gobelet*, in French, is applied to juggler's tricks and instruments, and our word goblet comes from the juggler's cup.

Bogle, bogle-boe, or bugaboo, may be from the Welsh *brogwly*, to terrify; and *boe* or *boo*, a sound. Bugaboo was the popular name of wide-mouthed, ugly pictures, formerly carried in May-games. Warton says Boh was the designation of a fierce Gothic chieftain, whose name was used in after-times to frighten children. The belief in benevolent and malevolent spirits belongs to all countries, and appears to be as old as the world.

GOBO'NY, in Heraldry, the same as *Componé* (q. v.). A gobonated bordure is frequently carried in place of the baton sinister, not only by the lawful issue of bastards, who, after the third lawful generation, are considered entitled to make the change, but by bastards themselves. See BASTARD BAR.

GOBY (*Gobius*), a genus of acanthopterous fishes, the type of the family *Gobiidæ*. This family is distinguished by the thinness and flexibility of the rays of the dorsal fin; by the union—in most of the genera—of the ventral fins, which are thoracic, into a disc more or less capable of being used as a sucker; by the want of an air-bladder: and by a long intestinal canal without cœca. The Blenny (q. v.) family (*Blenniidæ*) have by some ichthyologists been united with the Goby family, whilst others unite with them the *Discobolt* (q.v.). The true gobies (*Gobius*) are generally small fishes, some of them inhabiting the shallow water of the coasts, and others found in deeper water; the species very numerous, and found in the seas both of the northern and southern hemispheres. They are very interesting on account of their habits; and are of the number of nest-building fishes, employing *algæ* and grass-wrack (*Zostera marina*), in the spring season, for making their nests. When the female has deposited her eggs in the nest, the male watches over them till they are hatched. There are several British species, the largest of them—the BLACK GOBY (*G. niger*)—about five or six inches long, some of them pretty common on all parts of the coast, and much in request for aquaria, of which they are among the most interesting occupants. They are often found in rock-pools on the coast. The disc formed by the ventral fins is often used for adhesion to stones. Most of the gobies prefer seas or clayey or muddy bottom, in which they excavate canals to pass the winter in. The species are more numerous in the Mediterranean than in the British seas.—The Goby family includes the Dragonets (q. v.), and several other interesting genera, among which are the *Boleophthalmi* of the Chinese seas, remarkable for their power of thrusting out their eyes in order to look around them.

GOD (Lat. *Deus*; Gr. *Theos*), the self-existent and Supreme Being, creator and preserver of all things, and the object of human worship. The name is of Saxon origin. The idea is more or less definitely expressed in every language, as it may be said to be in some form or another a universal element of the human consciousness. There have been many nations, indeed, in every age of the world, that have been far from attaining any such conception of God as is expressed above. The Supreme has been to them the conception not of a single Being, but of many beings superior

Digitized by Google

to man, and claiming his worship. In the general history of the world, polytheism precedes monotheism; the idea of many gods goes before the idea of one God, infinite and self-existent.

The general character of polytheism is everywhere the same.—A dualistic conception of nature and life underlies it, and shews itself in varied expressions. In looking forth on nature—in looking within himself—man seems to see two principles striving for the mastery—an active and passive, a creative and recipient principle—a good and evil, a productive and destructive, a joyous and a gloomy agent. On one side, there seems a power rich, benignant, and gracious, giving light to the day, verdure to the spring, abundance in autumn, scattering fecundity and blessing around: on the other side, there seems a power cruel and malevolent, quenching the light in darkness, consuming the verdure and fertility with scorching heat, or destroying them with cold. These contrasts seem eternal—they take possession of the imagination, and clothe themselves in diverse shapes. In every polytheistic religion, they will be found in the recognition of male and female, of good and evil divinities—Baal and Baaltis, Baal-Adonis and Baal-Moloch, in the old Phœnician religion; Osiris and Isis and the evil principle, Typhon, in Egypt; and the more familiar opposites of Ahriman and Ormuzd, Jupiter and Juno, &c. The dualism assumes various shapes, now male and female, productive and passive; and now good and evil, conservative and destructive.

Whether this dualistic mode of conception, and the polytheistic view of nature that springs from it, be a later or an earlier type of thought than the monotheistic, has been a good deal disputed. Some see in it the corruption of monotheism—the worship of the Supreme gradually falling to a worship of the great forms of nature which most strikingly represent Him—the sun and storm, the light and darkness, &c. Others, again, regard the polytheistic as the primitive view of nature, above which man gradually rises, by the growth and exercise of his reason. There is truth in this latter view, even to those who believe that man originally received a Divine Revelation, which he has gradually corrupted. Polytheism is the natural religion of savage tribes throughout the world; and as man advances in civilisation, he rises to purer and more comprehensive conceptions of Deity. His reason compels him to recognise the One in the many everywhere, to carry up all his conceptions into a unity. Polytheism, consequently, everywhere disappears before the march of civilisation. It is incompatible with the lowest stage of speculative development.

But while the growth of reason and the rise of speculation everywhere destroy polytheism, they do not necessarily substitute a genuine monotheism—the doctrine, that is to say, of one living and true God, infinite in power, wisdom, goodness, and truth, a free personal Being exalted above the world, and apart from it, yet intimately related to all its creatures, who "suffereth not a sparrow to fall to the ground without his permission." This is the doctrine of Christian theism, as opposed alike to polytheism (the doctrine of many gods), pantheism (the doctrine that all things are God: that God is a unity, yet only a unity of comprehension, not a self-subsistent and independent unity), and atheism (the assertion that there is no God).

The course of argument on which the theistic conclusion supports itself may be sketched as follows: There are everywhere in the world the traces of order; a unity of plan or design, shewn in many beautiful effects, pervades creation. Science is always more unfolding it. Of *the fact* of this order or unity of plan, there is no question. The progress of science, if nothing else, has effectually exploded the old dualistic or polytheistic conception of nature. What appeared to be the result of opposing principles, is really found to be the issue of general laws working on some great although unexplored scheme of harmony. There is no disturbance, no *disorder*; amidst the infinite diversity of nature—*order* reigns universally.

But this "order," what is it? The mere recognition of order does not necessarily imply the recognition of God—of a "Being all-powerful, wise, and good, by whom everything exists." The materialist and pantheist equally admit the fact of order, but equally deny the theistic conclusion founded upon it; and the argument, accordingly, is carried up from nature and its facts to a higher region of discussion. Whence arises the conception of order—of design? Nature illustrates it, but nature does not itself give it. The general laws of which science speaks so much pervade all phenomena of creation, but they are not a part of these phe

Digitized by Google

nomena. "Order" and law are ideas which *we* convey to nature, not which nature brings to us. They come from within, not from without. It is with mind, and not with matter we start. The latter in itself presents a mere series of endless movements. It is in the presence of mind only that it assumes meaning and *order*. Mind is the true image of the Deity. We discern *causation* in nature, because we ourselves are *agents*, conscious of exerting power. We discern *order* in nature, because we everywhere bring our conceptions into a unity, and apprehend our several modes of consciousness with reference to the indivisible self which they all involve. "In our life alone does nature live." "It is from the little world of our own consciousness, with its many objects marshalled in their array under the rule of the one conscious mind, that we are led to the thought of the great universe beyond—that we conceive this also as a world of order, and as being such by virtue of its relation to an ordering and presiding mind."

The existence of Deity, therefore, is a postulate of the human consciousness. Recognise a living mind in man, independent of matter—a *rational will*, as constituting the essential and distinguishing element of his being—and the inference is inevitable of an infinite mind—a supreme will governing the world. A true natural theology is based upon a true psychology. A philosophy which denies to man a higher existence than nature, which would make his rational consciousness the mere growth of material conditions, leaves no ground of argument for the existence of Deity—for, as Jacobi says: "Nature reveals only fate, only an indissoluble chain of causes (sequences), without beginning and without end, excluding with equal necessity both providence and chance. Working without will, she takes counsel neither of the good nor of the beautiful; creating nothing, she casts up from her dark abyss only eternal transformations of herself, unconsciously and without end. But man *reveals* God—for man, by his intelligence, rises above nature, and in virtue of this intelligence, is conscious of himself, as a power not only independent of, but opposed to, nature, and capable of resisting, conquering, and controlling her. As man has a living faith in this power superior to nature, which dwells in him, so has he belief in God—a feeling, an experience of his existence. As he does not believe in this power, so does he not believe in God; he sees, he experiences nought in existence but nature, and necessity, and fate."

The argument for the existence of God rests, accordingly, on certain fundamental principles of our mental and moral being, such principles as causation and design, or final cause. It implies a spiritual philosophy of human nature. Apart from such a philosophy, theism has no argumentative basis, however it may prevail as a tradition or superstition.

But some philosophers have sought not merely to rest the argument for the existence of God upon such principles, but to evolve it in all its completeness from them alone. From a single datum of consciousness—sometimes from a single datum of experience—they have tried to construct, by processes of mere abstract reasoning, a "demonstration of the being and attributes of God." This has been styled the *à priori* method of argument, although to all the arguments to which this name has been given it does not strictly apply. The mode of argument, again, which reasons from special effects in nature to a First Cause, has been styled, in contradistinction, *à posteriori*. The argument from design, for example, as conducted by Paley and others, is *à posteriori*. The arguments of Descartes, and the "demonstration" of Dr Samuel Clarke, are what have been termed *à priori*. Either of these modes of proof, taken by itself, has been rightly considered inconclusive by recent writers on natural theology. Mere *à priori* trains of reasoning fail to carry up the mind to any real and living conception of Deity; they yield merely a theoretical or abstract idea. Arguments such as Paley's and the Bridgewater treatises, again, are rather illustrations than arguments. They derive all their logical force from certain principles which are implied in their details, and without which these details could have no bearing on the existence of God. The very idea of Design itself is such a principle. It is the die which the mind stamps upon nature; it is not in nature itself. Any complete argument for the Being of God, therefore, involves equally *à priori* and *à posteriori* elements. The former are necessary as the rational foundation of the argument; the latter are necessary to illustrate, to give life and body to the general principles which lie at the foundation.

The Christian doctrine of the Godhead will be considered under the several names of TRINITY, SON OF GOD, and HOLY SPIRIT.

GOD, Offences against. See SACRILEGE.

GOD SAVE THE KING (or Queen), the noble national anthem of Great Britain, and by adoption that of several of the German states, and which is played and sung in every part of the British empire alike on solemn and festive occasions, has been a subject of controversy with respect to its origin. Its words are apparently imitated from the Domine Salvum of the Catholic Church service. In England, the authorship has been generally attributed to Dr John Bull, born 1563, in 1591, organist in Queen Elizabeth's Chapel, 1596, professor of music in Gresham College, and chamber-musician of James I. About the period of the discovery of the Gun-powder Plot, he composed and played on a small organ before the king an ode beginning with the words, "God save great James our king." He died at Lübeck, 1622. It does not appear, however, that this, or any other old composition of a similar title, had any connection with that which we now possess. Chappell, in his "Popular Music of the Olden Time," and Dr Fink, a German musical antiquary, have settled the question; the honor of this great work, both words and melody, must be given to Dr Henry Carey, an English poet and musician, born in London about 1696, died 1743. The words and music were composed in honor of a birthday of George II., and performed for the first time at a dinner given on that occasion in 1740 by the Mercers' Company of London. The words and music were first published in the "Harmonia Anglicana," 1742, and appeared in the "Gentleman's Magazine," 1745. The air according to Dr Arne, has preserved its original form, but its harmonies have been modified by various artists; and the words were changed on the accession of William IV., and on that of Queen Victoria.

GODA'VERY, or Godavari, one of the principal rivers of the peninsula of Hindustan, and the largest of the Deccan, rises within 50 miles of the Arabian Sea, and flows south-east across the peninsula into the Bay of Bengal. Its source is in the eastern face of the Western Ghauts, in lat. 19° 55′ n., and long. 73° 30′ e.; and its two mouths, diverging in lat. 16° 57′ n., and long. 81° 49′ e., enter the sea respectively in lat. 16° 48′ and long. 82° 23′, and in lat. 16° 18′ and long. 81° 46′. About 28 miles above the head of the delta, the G. emerges at Polaveram from the Eastern Ghauts, through which it has passed with so moderate a descent as to be navigable in either direction. The southern arm of the G. admits vessels drawing eight or nine feet; and the northern one shews a depth of two or three feet more. Like tropical streams in general, the river varies greatly, according to the season, in breadth and depth. But a dam or annicut (see CAUVERY) has been constructed, so as to mitigate the evil for the purposes alike of navigation and of irrigation. The length of the G. is about 900 miles.—For the *district* of G., see RAJAMAHENDRI.

GOD-BOTE, an ecclesiastical fine, paid for crimes and offences against God. The word bote, the same as boot, is the old Saxon bot or bote, a reparation or satisfaction—e. g., man-bote was the compensation due for the life of a man.

GO'DESBERG, a village of Rhenish Prussia, with a fine ruin, is situated on a conical hill in the midst of a plain, on the left bank of the Rhine, and four miles south of Bonn. It has a mineral spring, is a favorite summer residence, and has a population of 2570. It derives its name, not from Woden, who is said to have been worshipped here, but more probably from the Gau-ding, or Goding, the district court which may have held its sittings at this place. The castle was erected by Dietrich, the Archbishop of Cologne (1208—1218), with materials taken from the ancient chapel of St Michael, the ruins of which are still standing near the castle. In 1582, Gebhard, the deposed archbishop, took refuge here, and intrusted the castle to a Dutch garrison. It was, however, soon after taken by his successor, on which occasion it sustained much injury. During the Thirty Years' War, it was alternately in the possession of the Swedes and the Imperialists, and was finally almost demolished by the French. Only one fine tower, 90 feet in height, is still standing. It commands a magnificent prospect of the Siebengebirge and great part of the valley of the Rhine, and is, on this account, much visited by strangers.

GODFATHER AND GODMOTHER, the person who, by solemnly presenting to the minister of baptism the candidate for that sacrament, which is regarded as a

Digitized by Google

new spiritual birth, is reputed to contract towards the newly baptized the relation of spiritual paternity or maternity. The effects of the usage are differently estimated in the different communions.

In the Roman Catholic Church, the parties presenting a child for baptism are called, from the spiritual *parental* relations which they contract, "godfather" (*patrinus*) and "godmother" (*matrina*); and from the *engagement* into which they enter on behalf of the baptized, "sponsors" (*sponsores*). The spiritual bond resulting from this relation is regarded as a species of kindred (whence the name *gossip*, or God-sib, *spiritually akin*), and constitutes, by the canon law, an impediment of marriage between the sponsors upon the one hand and the baptized and the parents of the baptized on the other. Anciently, this impediment arose also between the sponsors themselves, who were often very numerous, and extended besides to the other members of the kindred; but the Council of Trent limited the number of sponsors to "one or two," and restricted the matrimonial impediment within the limits above described. The parents of the baptized are not permitted to act as sponsors in the Roman Catholic Church, one of the objects of the institution being to provide instructors in case of the death of parents; nor are members of religious orders, because their inclusion within their convent is supposed to render it impossible for them to discharge permanently and regularly the duties of instructors to the newly baptized. In the Roman Catholic sacrament of confirmation also, the candidate is commonly presented by one sponsor, generally, though not necessarily, of the same sex with the candidate for confirmation. It is difficult to assign the precise date of the origin of this institution. No trace of it occurs in the New Testament, but it is believed to have been in use in the 2d c., and it certainly was an established practice in the fourth.

In the Church of England, two godfathers and a godmother are required at the baptism of a male, and two godmothers and a godfather at that of a female. In order to be admitted as such, the person must be baptized, must be of full age, acquainted with the Lord's Prayer, Creed, and ten commandments, and familiar with the fundamental truths of Christianity. No impediment of marriage arises in the English Church from the relation of the sponsors to the baptized. Practically, the usage in the Church of England has, for the most part, degenerated into a mere form; godfathers and godmothers usually giving themselves little concern in the future fate of the infant whose spiritual condition they become bound to watch over. In the Church of Scotland, and other non-Episcopal Churches, the parents of the infant occupy the place of sponsors; the father expressly taking the vows on the occasion.

GODFREY OF BOUILLON, Duke of Lower Lorraine, born about 1061, at Baisy, a village of Belgian Brabant, was the eldest son of Count Eustace II. of Boulogne, and Ida, sister to Gottfried of Godfrey, the Hunchback, Duke of Lower Lorraine and Bouillon, whom he succeeded in the government of the latter duchy in 1076. He served with great gallantry in the armies of the Emperor Henry IV., both in Germany and Italy; and it was from his hand that the competitor for the imperial crown, Rodolf of Swabia, received his deathblow at the battle of Merseburg. When the first Crusade was set on foot, the fame of his exploits caused him to be elected one of the principle commanders. In order to defray the expenses of the Crusade of 1095, he mortgaged Bouillon to the Bishop of Liège, and set out, accompanied by his brothers Eustace and Baldwin, in the spring of 1096. For a detailed account of his career up to the taking of Jerusalem, see CRUSADES. Eight days after the taking of Jerusalem, G. was proclaimed king by the unanimous voice of the crusading army; but the piety and humility of the conqueror forbade him to "wear a crown of gold where his Savior had worn one of thorns." He declined the regal title, contenting himself with that of Defender and Guardian of the Holy Sepulchre. The Sultan of Egypt, learning that the army of 300,000 Crusaders who had taken Antioch had dwindled away to 20,000, advanced against them with an army said to have amounted to 400,000 men; but G. gave him battle in the plain of Ascalon, and the victory gained on this occasion put him in possession of the whole of Palestine, a few fortified towns only excepted. He now directed his endeavors to the organisation of the new state; he installed a patriarch, founded two cathedral chapters, built a monastery in the valley of Jehoshaphat, and drew up laws. He died in 1100, and his body was interred on Mount Calvary, near the Holy Sepulchre. History repre-

Digitized by Google

sents this prince as a model of piety, valor, and all kingly virtues; and his praises have been worthily sung by Tasso in his "Jerusalem Delivered."

GODI'VA, Lady, patroness of Coventry. About the year 1040, Leofric, Earl of Mercia, and lord of Coventry, then an important market-town, imposed certain onerous services and heavy exactions upon the inhabitants, of which they loudly complained. His wife, the Lady G., having the welfare of the town at heart, besought her husband to give them relief, and was so earnest in her entreaties, that at length, to escape from her importunities, the earl said he would grant her the favor, but only on condition that she would ride naked through the town, supposing, from the modesty of Lady G., that he had required an impossible condition; but he was surprised with the answer: "But will you give me leave to do so?" As he could not in justice refuse, she ordered that proclamation be made that on a certain day no one should be away, or even look, from their houses, when, clothed only by her long hair, she rode through the town; and her husband, in admiration of her intrepid devotion, performed his promise. This circumstance was commemorated by a stained-glass window, mentioned in 1690, in St Michael's Church, Coventry; and the legend that an unfortunate tailor, the only man that looked out of a window, was struck blind, has also found commemoration in an ancient effigy of "Peeping Tom of Coventry," still to be seen in a niche of one of the buildings. By a charter of Henry III., 1218, a fair is held at Coventry, beginning on Friday of Trinity-week, and lasting eight days. The fair was opened with a grand civic procession, a part of which was, in 1678, the representation of the ride of Lady Godiva. These processions were continued at intervals of from three to seven years, until 1826. Some beautiful woman, who represented Lady G., was the principal figure, but many other historical and emblematic personages were introduced. In 1848, the procession was revived with great splendor, and attracted 15,000 strangers. The ceremony has, however, now fallen into disrepute, and the procession, when celebrated, is a vulgar and tawdry affair.

GÖDÖLLÖ, a market-town in Hungary, formerly the residence of the princely family Grassalkovich, is distinguished for its manorial castle, as well for the surrounding parks. It was on the woody heights of G. and Isaszeg that the combined armies of Austria, under Prince Windischgrätz and Count Jellachich, were defeated in two bloody battles by the Hungarians under Görgei. On the eve of victory, Governor Kossuth held a conference with the generals Görgei, Klapka, and Damjanich, for laying down the principles of the famous Declaration of Independence, issued on the 14th of April, 1849, by the diet at Debrecsin. It was this declaration which served the emperor of Russia as a pretext for the invasion of Hungary. Pop. (1869) 3661.

GODOLPHIN, Sydney, Earl of Godolphin, an English statesman, was descended from an old Cornish family, and was born, it is thought, about 1640. After the Restoration he became one of the grooms of the bed-chamber to Charles II., was appointed one of the secretaries of state in 1664, and soon after first commissioner of the treasury; was twice despatched to Holland in 1678 on business of importance, and argued and voted for the exclusion of the Duke of York from the succession in 1680. Nevertheless, when the latter mounted the throne, G. (now Baron Godolphin of Rialton, in Cornwall) was made lord-chamberlain to the queen; and on the landing of the Prince of Orange, he was one of the commissioners sent by King James to treat with the invader—a difficult piece of business, which he is considered to have managed with much tact and prudence. William was not slow to perceive the admirable abilities of G., and in 1690 appointed him first lord of the treasury. In 1695 he was one of the seven lords justices for the administration of the government during the king's absence. In 1702, on the accession of Anne, he accepted the office of lord high treasurer, mainly at the solicitation of Marlborough, who paid him a splendid compliment by declaring that otherwise he could not venture to assume the command of the British armies, as he could depend on him alone for punctual remittances. G. fully realised the expectations of the great Captain. He raised the public credit, induced the queen to contribute £100,000 towards the war, firmly opposed the selling of offices and places, and increased the stipends of the inferior clergy. In 1706, G. was raised to the dignity of Earl of Godolphin and Viscount Rialton; after this period he took part with the Whigs, as being more

Digitized by Google

patriotic and English than the Tories. The contest between him and Harley for the premiership resulted finally in the defeat of G., who was dismissed from office in 1710. He died at St Albans, September 15, 1712, and was interred in Westminster Abbey. The title became extinct in his son Francis, second Earl of Godolphin. G. was the best business-man of his age. He had the clearest and quickest understanding, and liked to do his work in such a way that it would not require to be done over again. In an age of corruption, G. was believed to be incapable of bribery, and he never employed as his agents any except men of integrity. His "talent for silence" equalled William's own.

GODOY. See ALCUDIA.

GOD'S TRUCE (Lat. *Treuga Dei*, or *Treua Dei*, from the Ger. *Treu*, true), one of the most singular among the institutions of the middle ages, which prevailed specially in France and the Germanic empire, but was also received for a time in the other countries of Europe. It consisted in the suspension for a stated time, and at stated seasons and festivals, of that right of private feud for the redress of wrongs, which, under certain conditions, was recognised by medieval law or usage. Private feuds, it is true, could only by the medieval law, which was called *Faustrecht* and *Fehderecht*, be undertaken when judicial redress had failed or could not be enforced, and after formal notice had been served upon the party against whom they were levied. But even with this limitation, private feuds multiplied exceedingly. The public peace was subject to constant interruption; the weak were without resource; the strong bore down all by the terror of their arms; and the whole social frame-work was so utterly disorganised, that men, by one of those religious impulses of which this age offers so many examples, fell back upon the aid of the church, and invoked her influence, as the only effectual means of staying the evil. It was in this crisis that the "God's Truce" originated. In the end of the 10th c., a council assembled at Limoges, at which the princes and nobles bound themselves, by solemn vow, not only to abstain from all unlawful feuds, but also to keep the peace mutually towards each other, and to protect from violence all defenceless persons, clerics, monks, nuns, women, merchants, pilgrims, and tillers of the soil. A similar engagement was entered into in a council at Orleans in 1016; and the whole body of the bishops of Burgundy enforced it upon their flocks everywhere throughout that duchy. A plague which visited a great part of Europe soon afterwards gave a fresh impulse to the movement; and in the year 1033, the "Holy Peace" was almost universally received, and for a time continued to be religiously observed. But as the old abuse began to revive by degrees, it was felt that the observance would carry with it more of religious authority, if, instead of being, as it had originally been instituted, universal, it was limited to certain times and days, which themselves had certain religious associations connected with them. Accordingly, in 1041, the bishops of Aquitaine limited the God's Truce to the week-days specially consecrated by the memory of the Passion and Resurrection of Christ—that is, from the sunset of Wednesday to sunrise of Monday. The same decree was renewed at Narbonne in 1054, and at Troyes in 1093. At Clermont, in 1095, it was extended to the whole interval from the beginning of Advent to the Epiphany, and from the beginning of Lent to Pentecost, to which times were afterwards added several other festivals. These enactments were adopted or renewed at several later councils; and although they were often disregarded, it is impossible to doubt that they had a wide and lasting influence in mitigating the evil against which they were directed. This singular institution fell gradually into disuse, and at last disappeared altogether when the right of private redress was restricted and at last entirely abolished, by the law of the empire.

GODWIN, William, an English author, was born at Wisbeach, in Cambridgeshire, March 3, 1756. His father and grandfather were Presbyterian ministers, and he was educated to the same profession, first at a school at Norwich, to which place his father had removed in 1767, where he made rapid progress in classical studies, and afterward at a Presbyterian college at Hoxton, where he pursued his theological studies. From 1778 to 1783, he was minister to a congregation in the neighborhood of London; but the zeal with which he first entered upon his duties declined, and a change in his theological opinions made it necessary for him to resign his charge. His only resource was to remove to the metropolis, and engage in literature. His

Digitized by Google

first work, a series of "Historical Sketches," in the form of sermons, was unsuccessful, and he was reduced to penury and despair; but they made him acquainted with Fox, Sheridan, and other Whig leaders, and he turned his attention to politics. The American revolution, closely followed by that of France, excited the public mind, and G. wrote his "Inquiry Concerning Political Justice," 1793. This was followed by "The Adventures of Caleb Williams," a remarkable novel, intended to illustrate the political views advanced in the "Political Justice." An able defence of Horne Tooke and others, published in the "Morning Chronicle," advanced his reputation; and, in 1797, he published "The Inquirer," a collection of essays on morals and politics. About this time, he formed an alliance with Mary Wollstonecraft, the celebrated author of the "Rights of Woman," and adopted and defended her extreme social views. After some months, however, they yielded so far to custom as to be married. His wife died a short time after in giving birth to a daughter, who afterwards became the second wife of the poet Shelley. In 1799 he published "St Leon," a romance, and the next year visited Ireland, where he associated with Curran, Grattan, and other eminent Irish political leaders. He also consoled himself for the loss of his wife by writing her Memoirs. In 1801 he married again, and had a son who died of cholera in 1832. To secure a more certain support, G. and his wife opened a circulating library, but he also worked indefatigably with his pen to the end of his life. He wrote many schoolbooks, an admirable "Life of Chaucer" (1801); "Fleetwood," a novel, 3 vols. (1805); "Mandeville," in 1817; a "Treatise on Population," a refutation of Malthus, in 1820; a "History of the Republic of England," in 4 vols. (1824—1828); "Cloudesley" (1830); "Thoughts on Man" (1833). As he grew old he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. Being now 77 years old, he was appointed to a place under government, which removed him from the apprehension of want; but he knew not how to be idle, and wrote "Deloraine," a novel, and the "Lives of the Necromancers." Many of his works were translated into foreign languages. He died in London April 7, 1836. See "William Godwin," by C. Kegan Paul (1876).

GODWIN, Earl of Wessex, a famous Saxon noble, was born towards the end of the 10th century. Originally, it is said, he followed the occupation of a cow-herd; but having found means to ingratiate himself with Ulfr, the brother-in-law of King Canute, the latter gave him his daughter in marriage, and he soon became one of the most powerful of the English nobles. More than any other person he contributed to the elevation of Edward to the English throne (1044 A.D.); and the principal reward of his services was the marriage of his beautiful and accomplished daughter Editha with the English king. This union, however, was not a happy one. Editha was cruelly neglected by Edward, and her father, on account of his dislike of the Normans, incurred the royal enmity. His estates were seized, and given to favorites, and he and his family fled. Queen Editha was made to feel even more bitterly than any one the misfortunes of her family. Her own husband seized her dower; he took from her her jewels and her money, "even to the uttermost farthing;" and allowing her only the attendance of one maiden, he closely confined her in the monastery of Wherwell, of which one of his sisters was lady-abbess. Meanwhile, shoals of Normans visited England for the purpose of making, or rather getting fortunes. Among Edward's most favored guests for a time was Duke William of Normandy, better known as William the Conqueror. The banished earl, however, had not been idle; through frequent correspondence with his countrymen at home, he kept alive the antipathy of the English to the Norman favorites of Edward, and in the summer of 1052 he landed on the southern coast of England. The royal troops, the navy, and vast numbers of the burghers and peasants, went over to him; and finally the king was forced to grant his demands. The Normans were for the most part expelled from the country, the G. family was restored to all its possessions and dignities; and at a meeting of the Witenagemôte, "the earls and all the best men of the land" declared that the foreigners alone were to be held guilty of the late dissensions that had distracted the country. G. died April 7, 1054. His son Harold was for a few months Edward's successor on the throne.

GO'DWIT (*Limosa*), a genus of birds of the family *Scolopacidæ*, with very long bill, slightly curved upwards, and long slender legs, great part of the tibia bare. All

Digitized by Google

the species frequent marshes and shallow waters, chiefly those of the sea-coast, where they seek their food by wading and by plunging the long bill into the water or mud, like snipes. They sometimes also run after small crustaceans or other animals, and catch them on the sands, from which the tide has retired. Two species occur in Britain, the BLACK-TAILED G. (*L. melanura*) and the BAR-TAILED G. (*L. rufa*), both birds of passage, and not unfrequent visitors of the marshy parts of the east coast of England, where the first occasionally breeds; but both generally breed in more northern countries, and are seen in Britain chiefly in their migrations northward and southward. Both species are very widely distributed over Europe, Asia, and Africa. The females are rather larger than the males, and the whole length of the female black-tailed G., which is rather the largest species, is about 17 inches, the bill alone being four inches long. They are much esteemed for the table, and are sent from Holland to the London market, which also receives some from the fens of Lincolnshire.

GOES, or Tergoes, a town and fortified seaport of Holland, in the province of Zeeland, is situated in a fruitful district in the island of South Beveland, about 8½ miles from its northern coast, and 17 miles west of Bergen-op-Zoom. It is well built; has a harbor formed by a canal communicating with the East Scheldt, shipbuilding docks, besides an active trade in hops, salt, and agricultural produce. Pop. (1875) 6239.

GOETHÉ, Johann Wolfgang von, the acknowledged prince of German poets, and one of the most highly gifted and variously accomplished men of the 18th century. He was born in the year 1749 at Frankfurt-on-the-Maine, where his youthful years were spent. His father, Johann Kaspar Goethe, was an imperial councillor, in good circumstances, and in a respectable position. In the year 1765, he went to the university of Leipsic, of which Ernest and Gellert were then the most notable ornaments. As a student, he pointed, by external profession, towards the law; but his real studies were in the wide domain of literature, philosophy, and above all, life and living character. In the year 1770, he went to Strasburg, to finish his juridical studies; but here also anatomy and chemistry, Shakspeare, Rousseau, and architecture—anything rather than the statute-book—occupied his time and exercised his soul. Here it was that one of the earliest, certainly the most famous of those youthful love-adventures took place, which, in his biography, as in that of Robert Burns, play such a prominent part—the well-known affair of Frederica Brion of Sesenheim. With regard to these matters in general, it may be said that he was more readily moved to love than intense in love; and that the objects of his admiration generally seem to have had more reason to boast of the delicacy of his susceptibility, than of the perseverance of his devotion. How far there was anything more than commonly culpable in these connections, will always be a question; certain it is that they will always tarnish to some extent the otherwise fair reputation of the poet. The female sex will never forgive the man who was so light to lend his heart, and so fearful to give his hand; and British morality will always be inclined to pass a severe judgment on the man who, professing the profoundest subjection to law and order in everything else, seems to have shrunk from the golden clasp of legitimate marriage as from some conventional shackle, which a free and great nature should avoid. In the year 1771, the young poet, now 22 years of age, took his degree as Doctor of Laws, and went for a short time to Wetzlar on the Lahn, the seat of the imperial chamber of the then German empire, and which afforded peculiar facilities for young men engaged in the study of public law. Here, however, as in other places, knowledge of the human heart, and of human character, altogether overgrew his professional studies; and Wetzlar became to him the scene of the famous "Sorrows of Werther," a glowing leaf from the life of the human soul, full of interest and beauty at all times, but which, in the then state of European thought and feeling, stirred the whole literary mind of Europe like a breeze sweeping over a forest. The book was not published till 1774. After returning from Frankfurt, G. spent some years in his native city, engaged chiefly in literary productions. His first great work was "Götz von Berlichingen," translated into English by Sir Walter Scott, published at Frankfurt, 1773, which at once set the Germans free from the painful constraint of French and classical models, and opened up to them that career of bold originality, which they have since prosecuted in so many departments

Digitized by Google

of literature, learning, and speculation. In the year 1775, G., who had had the good-fortune to gain the good opinion of Karl August, Grand Duke of Saxe-Weimar, accepted an invitation from that prince to settle in his little capital, since become so famous as the Athens of the great legislative age of German literature. Here the poet became a little statesmen; and occupying himself in various ways in the service of his benefactor, passed quickly through stages of court preferment, till, in 1779, he became "actual privy-councillor," at the age of 30, holding the highest dignity that a German subject could then attain; a great, a rich, and an influential man. In 1782, he received a patent of nobility; and in the following years, till 1788, travelled much in Switzerland and Italy, of which last journey we have the beautiful fruits in "Iphigenia," "Egmont," "Tasso," and the "Venetian and Roman Elegies." Of this last work, thoroughly German both in form and feeling, the heroine was Christiana Vulpius, a highly attractive though not a highly gifted woman, who bore him a child—his eldest son—in 1789; but whom, though he always treated her as his wife, he did not formally marry till 1806. In 1792, he took part in the German campaign against France, of which he has left a memoir. In the year 1815, he was made minister of state. After the death of the Grand Duke, in 1828, he lived much in retirement, occupied occasionally with poetry, but much more intensely and constantly with the study of nature and the fine arts, which from his earliest years had possessed the strongest attractions for him. He died in March 1832, in his eighty-fourth year.

To give a detailed account of the literary and scientific productions of G.'s pen, is altogether impossible within the limits of the present work; much less can we attempt any detailed criticism of these works. The best source of reference to the mere English reader is the biography of the poet, by G. H. Lewes; along with which may be taken G.'s interesting conversations with Eckermann, translated by Oxenford. On the general character and literary position of G., however, a few words are necessary. It is as a poet, no doubt, that this remarkable man is generally known and recognised in this country; but it is not as a poet only that a just measure can be taken of his intellectual calibre or of his European significance. It is as poet, thinker, critic, and original observer of nature, all combined in one admirable harmony, that his rare excellence consists. We do not find in literary history any intellect that can fitly be placed on the same platform with G.; that presents, in such grand and graceful completeness, so much severe thought, combined with so much luxuriant imagination; so much accurate science with so much playful fancy; so much simplicity with so much art; so much freshness and originality of productive power, with so much justness and comprehensiveness of critical judgment. As a dramatist, G. will not compare for a moment with the great masters of that art among ourselves. His English biographer detects in the constitution of his mind, most justly, "a singular absence of historic feeling and dramatic power." Not less correct is the judgment of the same writer when he says: "Goethe was attached to character and picture, indifferent to action and event." In this respect, the poet was a true type of his nation. As contrasted with the French and English, the Germans are deficient in nothing so remarkably as in stirring passion and progressive energy; the relation of G. to Shakspeare and the English dramatists is exactly the same. Nevertheless, "Faust" is a great poem, even a great dramatic poem, for it is full of dramatic scenes, though they are not sufficiently moved by the living current of dramatic action. "Faust" is essentially a German poem, and yet a poem which all foreigners can read and enjoy. It is the great drama of that moral and metaphysical questioning which thoughtful minds must go through in all times and places, but which has received the fullest and most fruitful development in modern Germany. Of the other poetical works of G., "Iphigenia," "Hermann and Dorothea," and "Tasso," are those which most strongly bear the type of the ripe manhood of the author. The form and style of these classical works are characteristically Greek; by which we mean they are chiefly remarkable for profundity of thought and truth of feeling, expressed in the most simple, graceful, and unpretending manner. In soul, however, they are essentially German; and the most deep-thinking of the Germans are always the first to claim G. as the most German of all German poets in spirit, though very few great German writers have so carefully avoided the most characteristic German defects of style. In the extraordinary

Digitized by Google

value which he attaches to "the form," G. authenticates himself everywhere as at once a great modern Greek and a great artist.

G. is a poet who is thoroughly relished only by those who understand thoroughly the German language, and whose minds are not so typically English as to exclude a ready sympathy with German thoughts and feelings. With general English readers, for various reasons, Schiller will always be the favorite poet. Nevertheless, there has been a considerable amount of literary power in this country spent in the translation of G.'s works, specially of his great work, the "Faust;" of this, at least a dozen translations exist, the most notable being by Bayard Taylor, Anster, Blackie, and Hayward. Some of the most beautiful of the lyric poems have been aptly rendered in a conjunct volume by Professor Aytoun and Theodore Martin.

GOG AND MAGOG, names several times used in the Bible, and the names given to the famous figures of giants in Guildhall, London. Magog is spoken of by the writer of Genesis as a son of Japhet; Ezekiel speaks of Gog, prince of Magog; Gog and Magog are spoken of in the Revelation. Magog is considered by some the father of the Scythians and Tartars. The Persians have also been derived from Magog, and the Goths from Gog and Magog. The Caucasus is supposed by Bochart to derive its name from Gog Chasan—fortress of Gog. Our Guildhall giants boast of almost as high an antiquity as the Gog and Magog of the Scriptures, as they, or their living prototypes, are said to have been found in Britain by Brute, a younger son of Authenor of Troy, who invaded Albion, and founded the city of London, at first called Troy-novant, 3000 years ago. Albion, at this period, was inhabited by a race of tremendous giants, the descendants of the thirty-three infamous daughters of the Emperor Diocletian, who, having murdered all their husbands, were sent to sea in a ship, and were happy enough to reach Albion, where, cohabiting with wicked demons, they gave birth to the giants, whom the Trojans finally conquered, leading the last two survivors prisoners to London, where they were chained to the gates of a palace on the site of Guildhall, and there kept as porters. When they died, their effigies were set up in their place. This is Caxton's account; but there is another, which represents one of the giants as Gogmagog, and the other as a British giant, who killed him, named Corineus. However the fact may have been, the two giants have been the pride of London from time immemorial. On London Bridge they welcomed Henry V. in 1415; they welcomed Henry VI. to London in 1432; and in 1554, Philip and Mary. In 1558, they stood by Temple Bar, when Elizabeth passed through the city gate. The old giants were burned in the great fire, and the new ones were constructed in 1708. They are 14 feet high, and occupy suitable pedestals in Guildhall. The ancient effigies, which were made of wicker-work and pasteboard, were carried through the streets in the Lord Mayor's Shows, and copies of the present giants were in the show of 1837. Formerly, other towns in England had their giants, and there are famous and some very large ones in several continental cities. The Antigonus of Antwerp is 40 feet high, and was formerly carried in the most solemn religious as well as civic processions. Gayant, the giant of Douai, is 22 feet high. There are also giants, and families of giants, at Lille, Malines, Brussels, &c., each connected with some popular tradition of their respective cities. The arms of Antwerp, a castle with severed hands, are connected with the legend of the giant who lived in the castle, and cut off the hands of those who failed to pay his exactions. Though it is now impossible to ascertain the facts, there can be little doubt that all these civic giants are exaggerated representatives of real persons and events.

GO'GARI, a river rising in Nepaul, about lat. 27° 20' n., and long. 86° 46' e., joins the Coosy, an affluent of the Ganges, in lat. 25° 24' n., and long. 87° 16' e., after a course of 235 miles.

GO'GO, a large town and a seaport of British India, in the presidency of Bombay, is situated on the west shore of the Gulf of Cambay, and has safe anchorage during the south-west monsoon, with smooth water and a muddy bottom. It is in lat. 21° 39' n., and long. 72° 15' e. Pop. (1872) 9571.

GOGOL, Nikolai, a Russian author of great and original genius, was born at the village of Wassiljewka, in the government of Poltova, in 1810. On finishing his studies, he went to St Petersburg, and solicited government employment, which

Digitized by Google

was refused, on the ground that "he did not know Russian." Shortly after, he proved that the officials were in the wrong by publishing a collection of novels and sketches, entitled "Vechera na Khutorie" (Evenings at a Farmhouse). The first and most important of these tales contains a vivid picture of Cossack manners, enabling us, according to M. Sainte-Beuve, to comprehend the profound antipathies that have for ages characterised the relations of certain branches of the Slavic family to each other. Then come the "King of the Gnomes;" the "History of a Fool," which is more a satire than a psychological study; and "The House-keeping of Former Times," a little masterpiece of its kind. The success of "Evenings at a Farmhouse" was immense, and Russian critics compared G.'s style to that of Washington Irving. It was followed by "Mirgorod," a supplementary volume, of the same character, containing stories full of poetry, and exciting astonishment not less by the vigor and grasp of mind displayed in the delineation of character, than by the extraordinary skill with which the plots are formed and unravelled. G. now turned his attention to the dramatic art, and produced the "Revizor," a comedy of brilliant genius, whose appearance on the stage excited quite a furor. The purpose of this piece was to expose the rooted abuses of the internal administration of Russian affairs. The Emperor Nicholas was the first to applaud its morality, and shewed his approbation by appointing the author professor of history in the university of St Petersburg. While holding this office, he published, in 1842, "Pokhozhdeniya Chichagova ili Mertvuiya Dushi" (Adventures of Chichagov, or Dead Souls), of which a bad translation appeared in English in 1854, under the title of "Home-life in Russia." The aim of this novel was to extinguish serfdom by ridicule. Exhausted by his labors, G. sought permission to travel, and visited Italy, where he took up his residence. There, however, his opinions appear to have undergone a change. From being an ardent Russian liberal and reformer, he became an apologist of despotism, an apostasy which he lived to regret. After the commotions of 1848, he returned to Russia, and died at Moscow in 1851.

GOHA'NUH, a town of British India, in the district of Rohtuk, in the Punjab, 45 miles north-west of Delhi. It is situated on the Rohtuk branch of the Delhi Canal, and near the northern extremity of a great depression of the soil, extending about 50 miles southwards. Pop. 6668.

GOHILWA'R, or Gohelwad, a region of Gujerat in India, comprising several tributary states, lies on the eastern coast of the peninsula of Kattywar. The native states in the "G. division" cover an area of about 3000 square miles, and have a pop. of upwards of 450,000. The soil of G. is fertile. Most of the rivers dry up in the hot season; the Setroonjee is the largest river. The chief mountains are Wullnk, Palitayna, and the Servi ranges. The capital of G., Bhaonagar, is within the British district of Ahmedabad.

GOIL, Loch, a small but highly picturesque loch in Argyleshire, Scotland, is a branch of Loch Long (q. v.), and is six miles in length, and about one mile in breadth. Its shores are for the most part wild and rugged; but the general character of the scenery is modified by extensive natural woods of hazel. The mountains in the neighborhood rise to the height of about 2500 feet. Lochgoilhead is a favorite summer watering-place. It may be visited by steamers from Glasgow.

GO'ITO, a small town in Lombardy, about 15 miles north-west from Mantua, occupies a beautiful though somewhat marshy position on the Mincio. This town, owing to its vicinity to the stronghold of Mantua, has been the field of various military operations. In 1630, it was carried by assault by the imperialists, who entered Mantua on the same night, and took it by surprise; during the war of the Spanish Succession in 1701, it was alternately captured by the allies and the imperialists; and in 1796 the French took it, but were expelled, after a brief tenure, by the Austrians. In 1814, a severe engagement took place at G. between the Austrian and Italian troops; and during the war of independence in 1848, it became the theatre of two further battles between the same powers, to which it owes its modern celebrity. Population, 3600.

GOI'TRE, an enlargement of the Thyroid Gland (q. v.), occupying the front of

Digitized by Google

the neck, and sometimes of such a size as to project downwards over the breast, and even to admit of being thrown over the shoulder. Goitre is for the most part an endemic or local disease, being found in the mountainous regions of the Alps, Andes, and Himalayn, especially, it is said, where lime prevails largely as a geological formation. The proofs of goitre being connected with a calcareous impregnation of the drinking-water are rather strong, but perhaps not quite sufficient, especially as regards this country, though the chief seat of goitre in England, Derbyshire, is subject to this alleged cause. Goitre is met with endemically, to a slight extent, in various parts of Scotland; but on a very small scale indeed as compared with Switzerland, in which it is a very important deformity, especially when connected with Cretinism (q. v.). Goitre is of two kinds: the one due to increased development of the vessels of the gland, the other to the growth of Cysts (q. v.) in its substance. To these might perhaps be added a third, which is found in connection with functional disease of the heart, but which is perhaps only a variety of the vascular goitre. The usual treatment of goitre is by the administration of very minute doses of Iodine (q. v.) for a long time together. The use of this remedy is due to Coindet of Geneva, who recognised it as the principal source of the virtues of burned sponge, long of high repute in the treatment of goitre.

GOLCO'NDA, a fortress of the Nizam, situated seven miles to the north-west of his capital, Hyderabad, stands in lat. 17° 22′ n., and in long. 78° 25′ e. In its immediate neighborhood are the ruins of an ancient city, once the metropolis of the kingdom of Golconda. The place itself is still strong; but its strength is seriously impaired through its being overtopped, within breaching-range, by the yet solid mausolea of its former sovereigns, which form a vast group at a distance of 600 yards. These tombs are dome-crowned structures of gray granite, each having its own mosque, and occupying the centre of its own elevated terrace. G. is proverbially famous for its diamonds; but, in truth, they are merely cut and polished here, being generally found at Partcall, near the southern frontier of the Nizam's dominions.

GOLD (symbol Au, atomic weight 196) has been known and regarded as the most precious of the metals from the earliest ages of the world, and has been universally employed as a medium of exchange. Although the quantity of G. which is found, when compared with that of many other metals, is small, yet there are few parts of the globe in which it does not occur more or less abundantly.

In the native state, it occurs crystallised, the primary form being the cube, or in plates, ramifications, or nodules—popularly known as *nuggets*—which sometimes are of very considerable size. It is almost always alloyed with silver, and sometimes with tellurium, bismuth, lead, &c. It sometimes occurs in small quantity in metallic sulphides, as in galena, iron and copper pyrites.

The extraction of G. from the substances with which it is associated is effected more by mechanical than by chemical means. See below.

The following are its most important properties. In its compact state, it possesses a characteristic yellow color and high metallic lustre, is nearly as soft as lead, and is the most malleable of all metals. It can be beaten into leaves of a thinness not exceeding 1-200000, or, according to some authors, 1-280000 of an inch, through which light passes with a green tint; one grain may thus be distributed over 56 square inches of surface, and the ductility of the metal is so great, that the same quantity may be drawn out into 500 feet of wire. In its tenacity, it is inferior to iron, platinum, copper, and silver; but a wire whose diameter is 0·757 (or rather more than one-third) of a line (which is one-twelfth of an inch), will support a weight of about 150 lbs. It fuses at about 2016°, according to Daniell's pyrometer, and when in fusion, is of a bluish-green color. It is scarcely at all volatile in the heat of the furnace, but by a powerful electric discharge, by the concentration of the sun's rays by a powerful burning-glass, or by the oxy-hydrogen jet, it is dispersed in purple vapors. G. has very little affinity for oxygen; it undergoes no change on exposure to the atmosphere, and is unaffected by hydrochloric, sulphuric, or nitric acid, or, in short, by any simple acid except selenic acid; nor do the alkalies affect it. It is, however, dissolved by any mixture which liberates chlorine, its usual solvent being *aqua regia*, which is generally prepared by mixing 1 part of nitric acid with 4 parts of hydrochloric acid. Hydrochloric acid to which binoxide of

Digitized by Google

manganese has been added, acts equally well, the G. in these cases being converted into a chloride. This metal is one of the most perfect conductors both of heat and of electricity. When precipitated in a finely comminuted state, it is of a brown color; but when suspended in water, and viewed by transmitted light, it appears purple. The specific gravity of this metal is less than that of platinum and iridium, ranging from 19·2 to 19·4, according as it is fused or hammered.

The alloys of G., or its combinations with other metals, are very numerous, those with copper and mercury being the most important. Copper and G. combine in all proportions without materially affecting the color of the latter, except that it is somewhat redder. The density of the compound is less than that of G., but the hardness is greater, and it is more fusible. It is this alloy which is employed in our gold coinage, 11 parts of G. being combined with 1 of copper, without which the coin would not be sufficiently hard to stand the wear to which it is exposed. Hence British standard G. contains 8·33 per cent. of copper. In France, and in the United States, standard G. contains 10 per cent. of the latter metal. Jewellers alloy their G. with other metals, partly on economical grounds, and partly for the purpose of evolving special tints. Thus, red G. is obtained by combining 75 parts of fine G. with 25 of copper; green G., by combining 75 parts of fine G. with 25 of silver; dead-leaf G., by combining 70 parts of fine G. with 30 of silver; water-green G., by combining 60 parts of fine G. with 40 of silver; blue G., by combining 75 parts of fine G. with 25 of iron.

Mercury and G. combine very readily, and yield a white alloy, termed an *amalgam*, which is used in gilding. In consequence of the readiness with which these metals unite even at ordinary temperatures, mercury is used for the extraction of gold.

As a general rule, the ductility of G. is much impaired by alloying other metals with it, while its hardness and sonorousness are increased.

Two oxides of G. are known—a protoxide, AuO, and a teroxide, AuO_3. Neither of these oxides can be formed by the direct union of the elements, and both of them are reduced by heat. The protoxide is a dark-green or bluish-violet powder. It forms no definite salts. It is obtained by the decomposition of protochloride of G. with a solution of potash. The teroxide is a brown powder, which is reduced, not only by heat and light, but by many other reducing agents. It combines more readily with bases than with acids, and hence has been termed *auric acid*. We obtain it by mixing a solution of terchloride of G. with magnesia or carbonate of soda, and boiling.

Two chlorides of G. are known, corresponding to the oxides, viz., a protochloride, AuCl, and a terchloride, $AuCl_3$. Of these, the latter is the most important: it is obtained by dissolving G. in aqua regia, and evaporating the solution to dryness, at a temperature not exceeding 300°, when we obtain this compound, as a deliquescent yellowish brown or reddish mass, which is soluble in water, alcohol, and ether, with which it forms orange-colored solutions.

The chlorides of many of the organic bases form crystallisable double salts with the terchloride of G.; and these compounds are often employed to determine the combining power of the organic alkali.

Metallic G., in the form of a brown powder, is thrown down from the solution of the terchloride by most reducing agents. This reducing power of protosulphate of iron is employed in the preparation of chemically pure gold.

A bisulphide of G. is obtained in the form of a black powder by passing a current of sulphuretted hydrogen through a cold solution of terchloride of gold. "If finely divided gold be heated with sulphur in contact with carbonate of potash, a double sulphide of gold and potassium is formed; it resists a red heat, and is very soluble in water; this sulphur salt is used for gilding china, and produces the color known as *Burgos lustre*."—Miller's "Elements of Chemistry," 2d edit. vol. ii. p. 74.

Fulminating G., a compound known to the alchemists, who (Basil Valentine, for example) formed solutions of terchloride of G., occurs as a green powder, when prepared by immersing teroxide of G. (or auric acid) in caustic ammonia. By modifying the mode of preparation, we obtain it of a brownish-yellow color. From Dumas's analysis of the green powder, it seems to be represented by the formula $2NH_3,AuO_3$, the brownish-yellow powder having a more complicated formula.

Digitized by Google

These powders detonate when rubbed, struck, or heated, or when an electric spark is passed through them, with a loud sharp report and a faint light, and they yield nitrogen gas, ammonia, and water. None but professed chemists should attempt to prepare them, in consequence of their dangerous explosive character. On one occasion, a drachm of fulminating G. introduced into a bottle burst it as the stopper was being turned round, in consequence of small particles of it having adhered about the mouth, and both the operator's eyes were destroyed by the projected fragments of glass.

The *Purple of Cassius* is an important gold compound. It derives its name from its having been first described by Andreas Cassius in 1685. See CASSIUS, PURPLE OF.

None of the salts of the oxides of G. are of sufficient importance to require notice in this article.

For the description of *Mosaic Gold*, see TIN.

GOLD was, in all probability, one of the earliest discovered of the metals. The fact of its being found very generally distributed over the surface of the earth, and that, too, in its simple metallic state, combined with its beautiful color, and many valuable properties, would cause it very early to attract the attention of man. Accordingly we learn that gold was used by the Hebrews, the Egyptians, and other ancient nations, for much the same purposes as it is at the present day.

Previous to the great Californian discovery in 1847, Europe was to a great extent supplied with G. from Mexico, Brazil, New Granada, Chili, and Peru in North and South America; a large quantity was also obtained from Asiatic Russia and the islands of the Indian Archipelago; the east and west coast of Africa furnished a less but still considerable quantity. All these countries still produce G., but their total yield, including Europe, is only about one-fourth that of California and Australia.

The most famous mines in Europe are those of Hungary and Transylvania, which produce annually about £300,000 worth of this metal. Piedmont and Spain are almost the only other European countries where G. is worked; but it is occasionally found in all districts where the rivers flow over primary rocks.

G. has been found in several parts of the British Islands. The most productive district yet discovered was that of Wicklow, in Ireland, where towards the close of the last century, the stream-works were prosecuted for some time with considerable success. In Scotland, the Leadhills, on the borders of Dumfriesshire, as well as the Highlands of Perthshire, and recently Helmsdale, in Sutherlandshire, have produced G.; so also have Cornwall and Devonshire in England, and in recent years a considerable quantity has been obtained from North Wales.

First among the celebrated gold discoveries of this century, in point of date, though not in importance, come those of Eastern and Western Siberia, where extensive auriferous tracts were discovered between 1829 and 1838. The quantity obtained in these eastern regions raised the annual produce of the Russian empire to three, and ultimately to four millions sterling—more than triple its former yield. Concerning Russia, it may be well to remark that an examination of the auriferous deposits of the Ural Mountains led Sir Roderick Murchison, in 1844, on comparing their rocks with those brought home by Count Strzelecki from Australia, to predict the presence of G. on the latter continent. Subsequent discoveries, as is well known, have proved the accuracy of this conclusion in a very remarkable degree.

The rich gold region of California was discovered in September 1847. Mr Marshall, the contractor for a saw-mill on the estate of Captain Suter—a Swiss emigrant, settled on the banks of the Sacramento River—detected particles of G. in the sand of the mill-race, and on further examination, it was found that valuable deposits existed throughout the bed of the stream. Intelligence of the discovery soon reached the town of San Francisco, whose scanty population at once abandoned their usual occupations to join in the exciting search for gold. The supply was soon found to be abundant over a large area, and emigrants quickly poured in from all parts of the American continent, and ere long from Britain, Germany, and other European countries, till the population of San Francisco alone rose from under 200 in 1845 to 40,000 in 1858, and in 1870 it was 150,000 (see SAN FRANCISCO). At first, it was thought that the supply of G. from this region would soon fail, but though the supply, which continued for several years at upwards of £18,000,000 per an-

Digitized by Google

num, had in 1874 fallen to between six and seven millions, which, moreover, included the yield of the adjoining states of Oregon, Idaho, Montana, and Wyoming, future mining prospects are far from being discouraging.

In 1851, before the excitement of the Californian discovery had time to subside, the world was startled by the announcement of another, or rather by a series of others, of not less importance, in Australia. It is a curious fact that not only Sir R. Murchison, as stated above, but also the Rev. W. B. Clarke, a native geologist, had pointed out the likelihood of G. being found in the eastern chain of the Australian mountains, several years before the value of the gold-fields near Bathurst was discovered by Mr Hargraves in April 1851. This discovery was no sooner made, however, than several other places in Bathurst and the adjoining counties were found to contain rich deposits; so that, before many months had passed 6000 persons were employed at these *diggings*. In August of the same year, further discoveries of G. were made at Ballarat, in Victoria, which excelled in richness those of the Sydney district; and these, in turn, were soon surpassed by fresh discoveries in the Mount Alexander range. During the climax of the excitement created by the Victoria gold-fields, the number of diggers rose to such a pitch as to withdraw for a time the great mass of the population from Melbourne and Geelong.

The modes of working adopted at the first start of the diggings were necessarily rude and wasteful; the fortunes of the gold-seekers, too, were of course very variable under such a system, many of them having made large profits—as much in a few instances, as a thousand pounds and upwards in a single week—but many more met with nothing but disappointment. A more systematic plan of mining, however, has now been introduced, by which the auriferous deposits are more completely worked out, and mining undertakings rendered less precarious. But notwithstanding the improved methods of working, the average annual produce of G. in the Australian colonies for the five years ending 1874, was only about £7,000,000, which was less than two-thirds of the yield of some earlier years. In the International Exhibition of 1862 there was a gilded pyramid 10 feet square at the base and 45 feet high, representing the mass of G. exported from Victoria between the 1st October 1851 and the 1st October 1861. Its weight in solid G. would have been 26,162.432 ounces troy, which, taken roundly at £4 per ounce, gives its value as £104.649,728. The produce of California since the discovery of its gold-fields in 1847, up to the present time, may be estimated at about 50,000,000 ounces, and its value at £200,000,000.

Since the two great gold regions of California and Australia became known, three new ones of considerable promise have been discovered—one of them in British Columbia, the value of which was proved in 1858, although previously it was to some extent known to the Hudson's Bay Company; another is being successfully developed in Nova Scotia; and a third in the province of Otago, in New Zealand. It would appear that there is a great similarity between the general rock systems and auriferous deposits of this region and those of Australia. Before passing from the subject of recent gold-fields, it is worth noting that a few years ago, Dr Livingstone the African traveller discovered G. near Tete on the Zambesi—a district which may be found to be rich in the precious metal, when more deliberately surveyed. Its position is remarkable as occurring in the centre of a coal-field.

The annual produce of G. in the whole world at the present time is somewhere between 30 and 40 millions sterling. Wherever G. is found, its origin can generally be traced to quartz veins in the primary or volcanic rocks, such as granite, gneiss, porphyry, clay-slate, or greenstone. As these rocks became decomposed by the action of the weather, portions of the auriferous veins were carried down by streams and floods, and so found their way into the deposits of sand, clay, and shingle in river-beds, and in the gullies and flats of hills. Many auriferous drifts are of great thickness, formed by long-continued wasting of the rocks of neighboring hills, and therefore require mining to a considerable depth. G. for the most part is found in small grains, or scales, called gold-dust; some of it, however, in pieces, or *nuggets* of considerable size. One found at Ballarat in 1858, called "The Welcome," weighed 2166 oz., and its value was £8376, 10s. 10d. Another discovered in Donolly district, Australia, in 1869, weighed 2520 oz., and its value was £9600. A good deal of the Mexican and European G. is obtained from auriferous pyrites.

Nearly all the metals except G. are most usually found as ores chemically com-

Digitized by Google

bined with oxygen, sulphur, or other substances; and they therefore require to be separated by chemical processes. Gold ores, if we may use the term, require to be mechanically treated by the processes of crushing, stamping, and washing; the amalgamation process being resorted to when the G. occurs in a state of fine division.

One kind of crushing-mill consists of two large cast-iron rollers, which break the auriferous quartz into small pieces as it passes through between them. More usually now, a stamping-mill is used with iron-shod piles of wood, wrought by an axle with projecting cams, after the fashion of flint-mills and beetling-machines. The ore pounded by the stamps is next washed, and for doing this there is an almost endless number of contrivances. In one of the richest quartz districts of California, it is carried by a current of water over coarse woollen blankets laid on sloping boards. By this plan, the lighter particles of quartz are carried away, and the particles of G. become entangled in the fibres of the wool. The blankets are washed at intervals in a tank, where the G. and other matters caught on their surface accumulates. It is then ready for the amalgamation process.

The G. of auriferous drift is partly extracted by washing, but there still remain minute particles invisible to the naked eye mixed with the *gangue;* indeed, some auriferous soils contain all their G. in a state of extreme division. To recover the G. either from this or stamped quartz, an amalgam is made; that is, it is mixed with mercury, which has the power of seizing on and dissolving the gold particles, however minute. The mercury is afterwards distilled off in a retort, leaving the G. nearly pure. G. has of late been profitably extracted from sulphuretted ores by Plattner's process, which converts it into a liquid chloride, and the G. is then precipitated from the solution by metallic copper.

To give some idea of the quantity of G. used in the arts, of which very little can be recovered, it may be stated that in the United Kingdom some 30,000 ounces in the shape of leaf gold, 10,000 ounces in the electroplate and other processes of gilding metals, and about the same quantity in gilding and making colors in the pottery districts, are annually consumed.

The quantity of G. poured into England during recent years has been immense. See GREAT BRITAIN. What has become of it all is often matter of surprise. Much has been sent to the mint, and much sent to foreign countries for their gold coinage. In France, Belgium, the Netherlands, Italy and Germany, all large sums are now paid in G. instead of silver. That the continued influx of G. is gradually heightening prices in the United Kingdom, is sufficiently obvious. The current price of standard gold is about £3 17s. 6d.

GOLD—Extraction by Sodium Amalgams. Certain difficulties which attend the separation of gold by amalgamation—caused by the presence of other metals which frequently cover the gold with a film of tarnish, and prevent the complete action of the mercury upon it—have led to the employment of sodium amalgamated with mercury in various proportions. This amalgam also restores the usefulness of mercury which has become *floured* or *sickened*. The compositions have been made the subjects of two patents, one by Dr Wurtz of New York in 1864, the other by Mr Crookes of London in 1865. Two kinds are now prepared in this country by Messrs Johnson, Matthey, and Co. of London, and are sent in large quantities to the various gold regions of the world, where their use is said to increase the yield of the precious metal by from 5 to 30 per cent. The separate compositions are known in commerce as Patent Amalgams, supplied in barrels of 2 to 5 cwt. each, or smaller quantities in tins or jars. These amalgams are of different compositions, the one containing 3, and the other (concentrated) 15 per cent. of sodium. Their prices are respectively 6s. 6d. and 8s. per lb. The average strength required for use with ordinary ores may be considered to be 10 lbs. of the three per cent. amalgam, to from 200 to 300 lbs. of mercury. The concentrated amalgam is used in the proportion of 10 lbs. to from 1000 to 1500 lbs. of mercury. When other metals besides sodium are used in these amalgams, they are generally zinc and tin. All amalgams containing sodium require to be preserved from damp in well-closed vessels.

GOLD-BEATER'S SKIN, a delicate membrane prepared from the large intestine of the ox, and used as a dressing for slight wounds, as the fabric for court-plaster, &c., but chiefly by gold-beaters. See GOLD-BEATING. The outer or peritoneal membrane is used for this purpose. The intestine is first subjected to a partial

Digitized by Google

putrefaction, by which the adhesion of the membranes is sufficiently diminished to to enable them to be separated; the separated membrane is then further cleaned from the adhering muscular fibres, dried, beaten, and pressed between paper, besides being treated with alum, isinglass, and white of egg, the object of which is to obtain the pure continuous membrane free from grease and impurities, without allowing the putrefactive processes to weaken it. A packet of 900 pieces of skin, each four inches square, is worth £8. They may be beaten continuously for several months with a twelve-pound hammer without material injury. The intestines of 500 oxen are required to furnish the 900 leaves that form one packet, or *mould*, as it is technically called. The manufacture is an extremely offensive one. Chlorine has been introduced both as a disinfectant and to assist in the separation of the membrane.

GOLD-BEATING, the process by which gold is extended to thin leaves used for gilding. The gold used for this purpose is usually alloyed with silver or copper, according to the color required. See GOLD. For *deep gold*, an alloy containing about 1 part of copper to 20 of pure gold is used. As goldleaf is not sold by weight, but by superficial measure, and as increasing the quantity of alloy diminishes the malleability, there is but little temptation to use the baser metals as an adulteration.

The gold is first cast into oblong ingots about ¾ths of an inch wide, and weighing two ounces. The ingot is flattened out into a ribbon of about 1-800th of an inch in thickness by passing it between polished steel rollers. This is annealed or softened by heat, and then cut into pieces of one inch square; 150 of these are placed between leaves of vellum, each piece of gold in the centre of a square vellum leaf, another placed above, and so on till the pile of 150 is formed. This pile is enclosed in a double parchment case, and beaten with a 16-pound hammer. The elasticity of the packet considerably lightens the labor of beating, by causing the hammer to rebound with each blow.

The beating is continued until the inch-pieces are spread out to four-inch squares; they are then taken out, and cut into four pieces, and squares thus produced are now placed between *gold-beater's* skin instead of vellum, made into piles, and enclosed in a parchment case, and beaten as before, but with a lighter hammer. Another quartering and beating produces 2400 leaves, having an area of about 190 times that of the ribbon, or a thickness of about 1-200,000th of an inch. An ounce of gold is thus extended to a surface of about 100 square feet. A still greater degree of thinness may be obtained, but not profitably. After the last beating, the leaves are taken up with wood pincers, placed on a cushion, blown out flat, and their ragged edges cut away, by which they are reduced to squares of 3¼ inches. Twenty-five of these are placed between the leaves of a paper book, previously rubbed with red chalk, to prevent adhesion of the gold, and are sold in this form.

Attempts have been made to apply machinery to gold-beating, but though very ingenious, their application is very limited; most of the goldleaf is still beaten by hand.

GOLD COAST. See GUINEA.

GOLD-EYE (*Hyodon*) a genus of malacopterous fishes, inhabiting the lakes and rivers of North America; the type of a family, *Hyodontidæ*, of which other members are found in tropical America and in Borneo. They are small fishes, much compressed like herrings, feed on insects like trouts, and like them are often taken by anglers with artificial flies. They have the mouth abundantly armed with teeth, having teeth far back on the palate as well as on the tongue and jaws.

GOLDFISH, or Golden Carp (*Cyprinus auratus*), a fish of the same genus with the carp, a native of China, but now domesticated and naturalised in many parts of the world. It is said to have been originally confined to a lake near the mountain Tsien-king, in the province of The-kiang, in China; but this statement is of questionable accuracy. It has been long common in many of the fresh waters of China, and was introduced into England about the end of the 17th or beginning of the 18th century. On account of the brilliancy of its colors and the ease with which it is kept in glass globes or other vessels, in apartments, it soon became, and has continued to be, a general favorite. Its ordinary length is five or six inches, but it has been known to reach a foot. When young, it is of a blackish color, but acquires its characteristic golden red as it advances to maturity, some individuals (*Silverfish*) becoming rather of a silvery hue. Monstrosities of various kinds are frequent,

Digitized by Google

particularly in the fins and eyes. The G. is now plentiful in some of the streams of Southern Europe, from which it is imported into Britain; but it also breeds in ponds in Britain, particularly in those into which hot water is poured from steam-engines, which sometimes swarm with its fry. In confinement, it may be fed with worms, insects, crumbs of bread, yolks of eggs dried and powdered, &c. Frequent changing of the water is advantageous, not only because of its being more fresh and better aërated, but because of the animalcules thus supplied for food.

GOLDLACE, a fabric formed by weaving silken threads that have been previously gilded. The peculiarity of this manufacture consists in the gilding of the silk in such a manner that it shall retain sufficient flexibility for weaving. A deep yellow or orange colored silk is used for the purpose. The usual method of doing this, is by what is called "fibre plating." A rod of silver is gilded by simply pressing and burnishing leaves of gold upon it. This gilded silver is then drawn into very fine wire, so fine that one ounce of metal can be extended to the length of more than a mile. It is then flattened between polished steel rollers, and further extended so that a mile and a quarter weighs only one ounce; for the last drawing, the wire is passed through ruby dies. The film of gold upon this flattened wire is much thinner than beaten goldleaf, and has frequently been quoted as an example of the divisibility of matter, as one inch of the highly gilded wire contains but the eighty-millionth part of an ounce of gold, or 1-100th of an inch, which is a visible quantity exhibiting the color and lustre of gold, contains but 1-800,000,000th of an ounce, or one ounce of gold covers more than 100 miles of wire. This flattened gilded wire is then wound over the silk, so as to enclose it completely, and produce an apparently golden thread.

Other means of directly gilding the thread have been tried, and for some purposes are successful, but none have yet been discovered which give the thread the same degree of lustre as the above, which was first practised in a rude manner by the Hindus.

Mr Hock's method of fibre gilding is to pass the silk through a mucilaginous solution, and then receive it on a brass cylinder, over which it is closely rolled. Goldleaf is then laid upon this coil of gummed silk, and thus one side is coated. The other side is gilded by rolling it from the first on to a second cylinder in the opposite direction, thus the plain side falls outermost, and is then coated with goldleaf as before. This is rather cheaper than the fibre plated silk, and more flexible, but not so brilliant.

GOLD MINES. In England, the crown has *prima facie* the right to gold mines; but where the gold is found in other mines, the crown is entitled only to take the gold at a fixed price. In Scotland, by an ancient act of 1592, the owner of the ground can demand a feu thereof from the crown, on paying one-tenth of the produce.

GOLD OF PLEASURE (*Camelina*), a genus of plants of the natural order *Cruciferæ*, having an erect calyx, small bright yellow flowers, and inflated pear-shaped or wedge-shaped pouches. The species are few. The Common Gold of Pleasure (*C. Sativa*), (Fr. *Cameline*, Germ. *Dotter*) is an annual plant 1½—3 feet high, with terminal racemes and pear-shaped pouches; the leaves smooth, bright green, entire or slightly toothed, the middle stem-leaves arrow-shaped and embracing the stem. Notwithstanding its high-sounding English name, the plant is of humble and homely appearance. It grows in fields and waste places in Europe and the north of Asia; it is not regarded as a true native of Britain, although often found in fields, particularly of flax, its seed being very commonly mingled with flaxseed imported from the continent. In many parts of Germany, Belgium, and the south of Europe, it is extensively cultivated for the sake of the abundant oil contained in its seeds. The seeds and the oil-cake made for them are also used for feeding cattle, although inferior to linseed, and to the oil-cake obtained from linseed. The oil, although sweet and pure at first, is very apt to become rancid, and is less valued than that of rapeseed or colza; the seeds of Gold of Pleasure are often mixed with rapeseed for the production of oil. The value of the plant in agriculture depends much on its adaptation to poor sandy soils, although it prefers those of a better quality; and on the briefness of its period of vegetation, adapting it for being sown after another crop has failed, or for being ploughed down as a green manure. The seed is sown either broadcast or in drills. The crop is cut or pulled when the pouches begin to

Digitized by Google

turn yellow; but the readiness with which seed is scattered in the field, rendering the plant a weed for future years, is an objection to its cultivation. It is not much cultivated in any part of Britain. The stems are tough, fibrous, and durable, and are used for thatching and for making brooms; their fibre is even separated like that of flax, and made into very coarse cloth and packing paper. The seeds are used for emollient poultices, which allay pain, particularly in cutaneous diseases.

GO'LDAU, formerly a small town of Switzerland, in the canton of Schwyz, was situated in a valley between Mount Rossberg on the north and Mount Rigi on the south, five miles northwest of the town of Schwyz, and is memorable for its destruction by one of the most stupendous and fatal landslips on record. The upper portion of the slope of the Rossberg, consisting of a layer of stone resting on light soil, had been loosened by continuous rains, which percolated under the rock and in a measure washed the soil from beneath it. On the 2d September, 1806, toward the evening, the outer layer of rock became completely detached and rushed down the mountain in a southwestern direction into the valley. In a few minutes not only G., but the neighboring villages of Businguen and Rothen were overwhelmed in destruction, a part of the Lake of Lauwerz was filled up, and by the sudden overflowing of the water the land to the west of Seewen was devastated. Two churches, 111 dwelling houses, 220 outhouses containing many cattle, and 400 men were buried in one moment. Only a few of the unhappy inhabitants, who at the moment of the landslip were at some distance from the scene, were saved. A numerous company of travellers who were on the point of commencing the ascent of Mount Rigi, were overtaken on the bridge of G. by the landslip and perished. The valley is now a wild rocky waste, but grass and moss are gradually creeping over and veiling its more rugged features. On a height in this valley through which the highway leads from Arth to Schwyz, a chapel has been erected. Compare Zry's "G. und seine Umgegend" ("G. and its Neighborhood," Lucerne, 1829).

GO'LDBERG, a manufacturing town of Prussia (of great antiquity), in the province of Silesia, is situated on an eminence on the banks of the Katzbach, 10 miles south-west of Liegnitz. It owes its origin and name to the gold-mines, which were worked here from the earliest times. At the commencement of the 12th c., they are said to have yielded 150 pounds of pure gold weekly. After the great victory won by the Mongol hordes near Liegnitz in 1241, in which 600 of the miners of G. perished, the town was taken by the conquerors. It also suffered greatly during the Thirty Years' War, and in 1813 was the scene of two engagements, the first between the French and Russians, and the second between the French and Prussians. Between 1868 and 1874 G. suffered repeatedly from destructive fires. The town is celebrated for its manufactures of broadcloth, hosiery, and gloves, and for its fruit. Pop. (1875) 6492.

GOLDEN AGE. In the mythologies of most peoples and religions, there exists a tradition of a better time, when the earth was the common property of man, and produced spontaneously all things necessary for an enjoyable existence. The land flowed with milk and honey, beasts of prey lived peaceably with other animals, and man had not yet by selfishness, pride, and other vices and passions, fallen from a state of innocence. At the foundation of this legend lies the deeply-rooted opinion that the world has degenerated with the progress of civilisation, and that mankind, while leading a simple, patriarchal life, were happier than at present. The Greeks and Romans placed this golden age under the rule of Saturn; and many of their poets—as, for example, Hesiod, in his "Works and Days," Aratus, Ovid, and, above all, Virgil, in the first book of the "Georgics"—have turned this poetic *matériel* to admirable account, and defined the gradual decadence of the world, as the silver, the brass, and the iron ages, holding out at the same time the consolatory hope that the pristine state of things will one day return.

GOLDEN BEETLE, the name popularly given to many of a genus of coleopterous insects, *Chrysomela*, and of a tribe or family, *Chrysomelinæ* or *Chrysomelidæ* belonging to the tetramerous section of the order. The body is generally short and convex, the antennæ are simple and wide apart at the base; some of the species are destitute of wings. Many are distinguished by great splendor of color. None are of large size. The finest species are tropical, but some are found in Britain. Some of them, in the larva state, commit ravages on the produce of the field and garden.

GOLDEN BULL (Lat. *Bulla Aurea*, Ger. *Goldene Bulle*), was so called from the gold case in which the seal attached to it was enclosed. The imperial edict known in German history under this title, was issued by the Emperor Charles IV., mainly for the purpose of settling the law of imperial elections. Up to this time much uncertainty had prevailed as to the rights of the electoral body, claims having frequently been made by several members of the lay electoral families, and divisions having repeatedly arisen from this uncertainty; the effect of such divisions being to throw the decision for the most part into the hands of the pope. In order to obviate these inconveniences, the golden bull defines that one member only of each electoral house shall have a vote—viz., the representative of that house in right of primogeniture, and in case of his being a minor, the eldest of his uncles paternal. On the great question as to the dependence of the imperial office on the pope, and as to the right of the pope to examine and approve the imperial election, the golden bull is silent, although it declares the emperor competent to exercise jurisdiction in Germany from the moment of election. It invests the vicariate together with the government of the empire during the interregnum, in the Elector Palatine, and the Elector of Saxony: but it is remarkable that this only applies to Germany. On the vicariate of Italy, which was claimed by the popes, nothing is said. The golden bull also contains some provisions restraining the so-called *Faustrecht* (literally, "fist-law"), or right of private redress. It was solemnly enacted in two successive diets at Nürnberg and Metz, in the year 1356, and original copies of it were furnished to each of the electors, and to the city of Frankfurt. The electoral constitution, as settled by this bull, was maintained almost unaltered till the extinction of the empire.

In Hungarian history there is a constitutional edict called by the same name. It was issued by Andrew II. in the early part of the 13th century. Without entering into details, it will be enough to say that the Golden Bull of Andrew II. changed the government of Hungary from an absolutism to an aristocratic monarchy, and that it contained till recent times the charter of the liberties of Hungary, or perhaps of the privileges of the noble class. See Schmidt's "Geschichte der Deutschen," iii. 638.

GOLDEN-CRESTED WREN (*Regulus aurocapillus*), a very beautiful bird of the family *Sylviadæ*, the smallest of British birds. Its entire length is scarcely three inches and a half. Notwithstanding its English name, it is not really a wren, but this name continues in popular use rather than *Regulus* and *Kinglet*, which have been proposed instead. The golden-crested wren is greenish-yellow on the upper parts, the cheeks and throat grayish-white; the crown feathers elongated, and forming a bright yellow crest. In its habits, it is intermediate between the warblers and the tits. It particularly affects fir-woods. It is not uncommon in Britain, from the most southern to the most northern parts; but many come also from more northern countries to spend the winter, and it is on record that, in October 1822, thousands were driven on the coast of Northumberland and Durham by a severe gale from the north-east. The nest of this bird is suspended from the outermost twigs of a branch of fir, some of them being interwoven with it.—Another species (*R. ignicapillus*), with more vividly red crest, is sometimes found in Britain, and species are found in Asia and North America.

GOLDEN-EYE. See GARROT.

GOLDEN-EYE FLY (*Hemerobius perla*, or *Chrysopa perla*), a neuropterous insect, common in Britain; pale green, with long threadlike antennæ, long gauze-like wings, and brilliant golden eyes. Its flight is feeble. The length, from the tip of the antennæ to the tip of the wings, is almost an inch and a half, but the insect without wings and antennæ is not above one-third of this length. The female attaches her eggs in groups of 12 or 16, by long hairlike stalks, to leaves or twigs. They have been mistaken for fungi. The larvæ are ferocious-looking little creatures, rough with long hairs, to which particles of lichen or bark become attached; they are called *aphis-lions*, and are very useful by the destruction of aphides, on which they feed. The pupa is enclosed in a white silken cocoon, from which the fly is liberated by a lid.

GOLDEN FLEECE, in Greek tradition, the fleece of the ram Chrysomallus, the recovery of which was the object of the Argonautic expedition. See ARGONAUTS.

Digitized by Google

The Golden Fleece has given its name to a celebrated order of knighthood in Austria and Spain, founded by Philip III., Duke of Burgundy and the Netherlands, at Bruges, on the 10th January, 1429, on the occasion of his marriage with Isabella, daughter of King John I., of Portugal. This order was instituted for the protection of the church, and the fleece was probably assumed for its emblem, as much from being the material of the staple manufacture of the Low Countries, as from its connection with heroic times. The founder made himself Grand Master of the order, a dignity appointed to descend to his successors; and the number of knights, at first limited to 24, was subsequently increased. After the death of Charles V., the Burgundo-Spanish line of the House of Austria remained in possession of the order; but at the close of the Spanish war of succession, the emperor, Charles VI., laid claim to it in virtue of his possession of the Netherlands, and taking with him the archives of the order, celebrated its inauguration with great magnificence at Vienna in 1713. Philip V., of Spain, contested the claim of Charles; and the dispute, several times renewed, was at last tacitly adjusted by the introduction of the order in both countries. The insignia are a golden fleece hanging from a gold and blue enamelled flintstone emitting flames, and borne in its turn by a ray of fire. On the enamelled obverse is inscribed *Pretium laborum non vile.* The decoration was originally suspended from a chain of alternate firestones and rays, for which Charles V. allowed a red ribbon to be substituted, and the chain is now worn only by the Grand-Master. The Spanish decoration differs slightly from the Austrian. The costume consists of a long robe of deep red velvet, lined with white taffetas, and a long mantle of purple velvet lined with white satin, and richly trimmed with embroidery, containing firestones and steels emitting flames and sparks. On the hem, which is of white satin, is embroidered in gold, *Je l'ay empris.* There is also a cap of purple velvet embroidered in gold, with a hood, and the shoes and stockings are red. In Austria, the emperor may now create any number of knights of the Golden Fleece from the old nobility; if Protestants, the pope's consent is required. In Spain, princes, grandees, and personages of peculiar merit are alone eligible.

GOLDEN LEGEND (Lat. *Aurea Legenda*), a celebrated collection of hagiology, which for a time enjoyed almost unexampled popularity, having passed through more than a hundred editions, and translations into almost all the European languages. It is the work of James de Voragine, also written "Vragine" and "Varagine," who was born about the year 1230. He entered the Dominican order, and was elected, at a comparatively early age, provincial of the order in Lombardy in 1267. Towards the end of that century, he was elected Archbishop of Genoa; and by his ability, his moderation, and his exemplary life, he played a most influential part in the public affairs of his time, being called more than once into the councils of the popes themselves, in affairs of difficulty. The Legenda consists of 177 sections, each of which is devoted to a particular saint or festival, selected according to the order of the calendar. In its execution, the work, as may well be supposed from its age, is far from critical, but it is deserving of study as a literary monument of the period, and as illustrating the religious habits and views of the Christians of that time. It presents a very different phase of the medieval mind from that which is exhibited in the acute and severely philosophical incubrations of the schools. A translation of the G. L. was made by William Caxton, for the Earl of Arundel, and first published in 1483.

GOLDEN NUMBER for any year is the number of that year in the Metonic Cycle (q. v.), and as this cycle embraces 19 years, the golden numbers range from 1 to 19. The cycle of Meton came into general use soon after its discovery, and the number of each year in the Metonic cycle was ordered to be engraved in letters of gold on pillars of marble, hence the origin of the name. Since the introduction of the Gregorian calendar, the point from which the golden numbers are reckoned is 1 B.C., as in that year the new moon fell on the 1st of January: and as by Meton's law the new moon falls on the same day (1st of January) every 19th year from that time, we obtain the following rule for finding the golden number of any particular year: "*Add* 1 *to the number of years, and divide by* 19, *the quotient gives the number of cycles and the remainder gives the golden number for that year; and if there be no remainder, then* 19 *is the golden number, and that year is the last of the cycle.*" The golden number is used for determining the Epact (q. v.), and the time for holding Easter (q. v.).

GOLDEN-ROD (*Solidago*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, closely allied to *Aster*, but distinguished by the single-rowed pappus and tapering—not compressed—fruit. The species are natives chiefly of temperate climates, and are most numerous in North America. A few are European; only one is British, the COMMON G. (*S. Virgaurea*), a perennial plant of very variable size, as there is a small alpine variety (sometimes called *S. Cambrica*) only a few inches high, whilst the common variety, found in woods and thickets in most parts of Britain, is from one to four feet high. It has erect panicled crowded racemes of small yellow flowers. It is an ornamental plant, and is sometimes seen in gardens. It had at one time a great reputation as a vulnerary, whence the name Solidago, it is said, from Lat. *solidare*, to unite. The leaves of this and a fragrant North American species, *S. odora*, have been used as a substitute for tea. They are mildly astringent and tonic.

GOLDEN ROSE, a rose formed of wrought gold, and blessed with much solemnity by the pope in person on Mid-lent Sunday, which is called, from the first word of the festival, "Lætare Sunday." The prayer of blessing contains a mystic allusion to our Lord as "the flower of the field and the lily of the valleys." The rose is anointed with balsam, fumigated with incense, sprinkled with musk, and is then left upon the altar until the conclusion of the mass. Formerly, in the solemn papal procession of the day, the pope carried it in his hand. It is usually presented to some Catholic prince, whom the pope desires especially to honor, with an appropriate form of words. The origin of the ceremony is uncertain, but the most probable opinion as to its date is that of Martène and Du Cange, who fix it in the pontificate of Innocent IV. See Wetser's "Kirchen Lexicon," vol. ix. 397.

GOLDEN RULE, a process in arithmetic, so called from the universality of its application. See PROPORTION.

GOLDFINCH (*Fringilla carduelis*, or *Carduelis elegans*), a pretty little bird of the family Fringillidæ, a favorite cage bird on account of its soft and pleasing song, its intelligence, its liveliness, and the attachment which it forms for those who feed and caress it. The genus *Carduelis* is distinguished by a thick conical bill, without any bulging, attenuated and very sharp at the tip. There are two groups, and one British species of each—a group with gay plumage and more prolonged bill, of which the G. is the British representative, and another with darker plumage and shorter bill, represented by the Aberdevine (q. v.), or Siskin. The G. is about five inches in entire length; black, blood-red, yellow, and white are beautifully mingled in its plumage. The colors of the female are duller than those of the male. It is widely diffused throughout Europe, and is found in some parts of Asia. It is a common bird in Britain, more abundant in England than in Scotland, but somewhat local. It is to be seen in small flocks on open grounds, feeding on the seeds of thistles and other plants, and in the earlier parts of the season frequents gardens and orchards. Its nest is made in a tree, bush or hedge, is remarkable for its extreme neatness, and is always lined with the finest downy material that can be procured. The eggs are four or five in number, bluish white, with a few spots and lines of pale purple and brown. The G. is much employed by bird catchers as a call bird. It can be trained to the performance of many little tricks, that which most of all the trainers seem to prefer, being the raising of water for itself as from a well, in a bucket the size of a thimble. The AMERICAN G. (*F.* or *C. tristis*) is very similar to the European species, has very similar habits and song, and displays the same interesting liveliness and affectionateness in domestication. The nest is also of the same elegant structure. It is a common bird in most parts of North America.

GOLDO'NI, Carlo, the most celebrated writer of comedy among the Italians, was born at Venice in 1707, and received his first education at Rome. His father originally intended him for an actor, and fitted up a private theatre for his diversion at home, but the boy shewed no aptitude for histrionic performances, and in consequence he was sent to Pavia to study for the church. G., however, was still less fitted for being an ecclesiastic than an actor, and was finally expelled from college for writing scurrilous satires. In 1731, after his father's death, he was received as advocate; but finding the legal profession by no means lucrative, he relinquished its practice, and set about composing comic almanacs which became highly popular.

Digitized by Google

Several of his minor comedies were represented about this time, and attracted much public favor by their novelty as well as their real merit. In 1736 he espoused the daughter of a notary of Genoa, and subsequently went to Bologna, where, having obtained an introduction to Prince Lobkowitz, he was intrusted with the composition of an ode in honor of Maria Theresa, and with the organisation of the theatrical entertainments of the Austrian army. We next hear of him at Florence, working assiduously at comedies, which were, however, but an earnest of his best pieces. On his return to Venice he made very lucrative arrangements with the manager of the theatre of St Luke, and after a visit to Rome passed into France, and was appointed Italian master to the royal children, which situation allowed him to devote himself tranquilly to his literary occupations. In Paris he produced one of his most admired comedies, written in French, and entitled "Le Bourru bienfaisant" (The Benevolent Grumbler). It excited universal admiration, and drew forth a most eulogistic criticism from the pen of Voltaire. On the breaking out of the revolution, G. lost his pension, and died (January 1793) shortly before its restoration by decree of the Convention. The greater part of it was allowed to his widow, who likewise received the arrears due from the time of its cessation. G. has left 150 comedies of unequal merit. The larger part are inimitable representations of the events of daily life, under both their simplest and most complex aspects. One aim pervades steadily all G.'s compositions—the advancement and elevation of honorable sentiments and deeds, and the flagellation of the prevailing vices and follies of the day.

GOLDSCHMIDT, Madame, (JENNY LIND), a celebrated Swedish singer, was born at Stockholm, October 6, 1821. She was of humble parentage, and her musical gifts were first noticed by an actress, by whose influence she was admitted, at the age of nine, into the Conservatory of Stockholm, where she received lessons of Crœlius and Berg. She sang before the court with success, and at the age of 16 appeared in the *rôle* of Agatha, in "Der Freischütz." Four years later, she went to Paris, to receive lessons from Garcia. Her voice was now thought wanting in volume, and when she appeared at the Grand Opera two years later, her failure was so mortifying, that she is said to have resolved never again to sing in France. Returning to Stockholm, she was heard with enthusiasm in "Robert le Diable," and at the instance of Meyerbeer was engaged at Berlin in 1845. After singing two years in Prussia, she visited Vienna, and other German cities, and made her *debut* in London in 1847, with a very marked success. Her return to Stockholm was greeted with an ovation, and the tickets to the opera in which she appeared were sold at auction. She returned to London in 1849, and won an immense triumph. The royal family and court were present at nearly every representation, and the receipts were often over £2000. The London season was followed by a concert tour in the provinces, with a similar success, and her great popularity was increased by the distribution of a large part of her receipts in charities. In 1850 she made an engagement with Mr. P. T. Barnum of New York, for a concert tour in America, extending through the United States, British provinces, Mexico, and the West Indies. The receipts of this well-managed tour were 610,000 dollars, of which Mademoiselle Lind received 302,000 dollars. While in America, she was married to M. Otto Goldschmidt, a native of Hamburg, who accompanied her as pianist. They returned to Europe in 1852, and resided at Dresden after she had visited Stockholm, and expended £40,000 in endowing schools in her native country. Since then Madame G. has rarely sung at concerts. In 1874, M. and Madame G. became leading professors at the Rhenish Academy of Music in Wiesbaden. Her voice is a contralto of moderate range, but much power and expression. Her kind manners and abundant charities contributed to her popularity and success.

GOLDSINNY, or Goldfinny, a name given to certain small species of *Crenilabrus*, a genus of fishes of the Wrasse family (*Labridæ*). They are rare on the British coasts, but are more plentiful on those of the north of Europe. They frequent rocky coasts, and are sometimes taken by anglers from the rocks. They receive their name from their prevalent yellow color. Like the wrasses, they have a very elongated dorsal fin.

GOLDSMITH, Oliver, was born in the village of Pallas, in the county of Long-

Digitized by Google

ford, Ireland, 10th November 1728. His father, the Rev. Charles Goldsmith, a clergyman of the Established Church, held the living of Kilkenny West. At the age of six, G. was placed under the care of the village schoolmaster, when an attack of small-pox interrupted his studies. On his recovery, he attended school at various places. On the 11th June 1745, he entered Trinity College, Dublin, as a sizar; the expense of his education being defrayed by his uncle, the Rev. Thomas Contarine. At the university—where Burke was his contemporary—G. gave no evidence of the possession of talent, and becoming involved in some irregularity, quitted his studies in disgust. He lingered in Dublin till his funds were exhausted, then wandered on to Cork, where, he being in great distress, a handful of peas was given him by a girl at a wake, the flavor of which remained for ever sweet in his memory. By his brother Henry, he was brought back to college, where, on the 27th February 1749, he received the degree of B.A. His uncle was now anxious that his nephew should enter the church; but when he appeared before the bishop, he was rejected. His kind-hearted relative then gave him £50, and sent him to Dublin to study law; but G., being attracted to a gaming-table, risked his entire capital, and of course lost it. Another sum was then raised, and he proceeded to Edinburgh to study medicine, where he remained 18 months, but did not take a degree. He then proceeded to the continent, hovered about Leyden for some time, haunting the gaming-tables with but indifferent success; and in February 1755, he left that city to travel on foot through Europe, scantily provided as to purse and wardrobe, but rich in his kindly nature and his wonder-working flute.

After taking his degree of B.M. at Padua or Louvain, G. returned to England in February 1756, when, by the assistance of Dr Sleigh, a fellow-student, he set up as a physician among the poor. He did not succeed in his profession, and he is represented as having become usher in the academy of Dr Milner at Peckham. During this period he supported himself by contributions to the "Monthly Review." He became candidate for a medical appointment at Coromandel, but was rejected by the College of Surgeons. The clothes in which he appeared for examination had been procured on the security of Mr Griffiths, editor of the "Monthly Review;" and as G., urged by sharp distress, had pawned them, his publisher threatened him with the terrors of a jail. He had now reached the lowest depths of misery; but the dawn was about to break.

His first publication of note was an "Inquiry into the Present State of Polite Learning in Europe," and was published in April 1759. In January 1760, Mr Newbery commenced the "Public Ledger," to which G. contributed the celebrated "Chinese Letters," afterwards republished under the title of "The Citizen of the World." He also wrote a "Life of Beau Nash," and a "History of England," in a series of letters. On the 31st May 1761 he was introduced by Dr Percy to Dr Johnson, who, in his turn, introduced his new friend to the Literary Club. In December 1764, "The Traveller" appeared, and at once placed him in the front rank of English authors. Two years after this he published the "Vicar of Wakefield," which has now charmed four generations. In rapid succession he produced his other works. The comedy of the "Good Natured Man," in 1767; the "Roman History," in 1768; and "The Deserted Village"—the sweetest of all his poems—in 1770. In 1773, his comedy of "She Stoops to Conquer" was produced at Covent Garden with great applause. His other works are—"Grecian History," 1774; "Retaliation," a poem, 1777; and "History of Animated Nature," which he did not live to complete. Although now in receipt of large sums for his works, G. had not escaped from pecuniary embarrassment. He was extravagant, loved fine living and rich clothes, his charities were only bounded by his purse, and he haunted the gaming-table quite as frequently, and with as constant ill success as of old. In March 1774, he came up to London, ill in body and harassed in mind, and took to bed on the 25th. With characteristic wilfulness and imprudence, he, contrary to the advice of his medical advisers, persisted in the use of James's Powder. He became rapidly worse, and Dr Turton said: "Your pulse is in greater disorder than it should be from the degree of fever you have. Is your mind at ease?" "No, it is not," was the poet's reply, and the last words he uttered. He died on the 4th April, £2000 in debt, and more sincerely lamented than any literary man of his time. Old and infirm people sobbed on the stairs of his apartments, Johnson and Burke grieved, and Reynolds, when he heard the news, laid down his pencil, and left his studio. He was buried

Digitized by Google

in Temple Church, and a monument was erected to him in Westminster Abbey, bearing an epitaph by Dr Johnson.

G. was the most natural genius of his time. He did not possess Johnson's mass of intellect, nor Burke's passion and general force, but he wrote the finest poem, the most exquisite novel, and—with the exception perhaps of the "School for Scandal"—the most delightful comedy of the period. Blundering, impulsive, vain, and extravagant, clumsy in manner and undignified in presence, he was laughed at and ridiculed by his contemporaries; but with pen in hand, and in the solitude of his chamber, he was a match for any of them, and took the finest and kindliest revenges. Than his style—in which, after all, lay his strength—nothing could be more natural, simple, and graceful. It is full of the most exquisite expressions, and the most cunning turns. Whatever he said, he said in the most graceful way. When he wrote nonsense, he wrote it so exquisitely that it is better often than other people's sense. Johnson, who, although he laughed at, yet loved and understood him, criticised him admirably in the remark: "He is now writing a Natural History, and will make it as agreeable as a Persian tale." The best life of Goldsmith is that by Forster, entitled "The Life and Times of Oliver Goldsmith" (Lond. 1854).

GOLDSMITHS' NOTES; the earliest form of bank-notes; so called because goldsmiths were the first bankers. See BANK-NOTES.

GOLF, or Goff, a pastime almost peculiar to Scotland, derives its name from the club (Ger. *Kolbe;* Dutch, *Kolf*) with which it is played. It is uncertain when it was introduced into Scotland, but it appears to have been practised by all classes to a considerable extent in the reign of King James I. Charles I. was much attached to the game, and on his visit to Scotland in 1641, was engaged in it on Leith Links when intimation was given him of the rebellion in Ireland, whereupon he threw down his club, and returned in great agitation to Holyroodhouse. The Duke of York, afterwards James II., also delighted in the game; and Prince Leopold, who not unfrequently plays, was elected captain of the St Andrews Royal Club in 1876.

Until late years, golf was entirely confined to Scotland, where it still maintains its celebrity as a national recreation; but latterly it has been established south of the Tweed, as well as in many of the British colonies. It is played on what are called in Scotland *links* (Eng. *downs*), that is, tracts of sandy soil covered with short grass, which occur frequently along the east coast of Scotland. St Andrews and Leven in Fife, Prestwick in Ayrshire, Musselburgh in Mid Lothian, North Berwick and Gullane in East Lothian, Carnoustie and Montrose in Forfarshire, and Aberdeen, are examples of admirably suited links, as the ground is diversified by knolls, sand-pits, and other *hazards* (as they are termed in golfing phraseology) the avoiding of which is one of the most important points of the game.

A series of small round holes, about four inches in diameter, and several inches in depth, are cut in the turf, at distances of from one to four or five hundred yards from each other, according to the nature of the ground, so as to form a circuit or *round*. The rival players are either two in number, which is the simplest arrangement, or four (two against two) in which case the two partners strike the ball on their side alternately. The balls, weighing about two ounces, are made of gutta-percha, and painted white so as to be readily seen.

An ordinary golf-club consists of two parts spliced together—namely, the shaft and head: the shaft is usually made of hickory, or lance-wood; the handle covered with leather; the head (heavily weighted with lead behind, and faced with horn) of well-seasoned apple tree or beech. Every player has a *set* of clubs, differing in length and shape to suit the distance to be driven, and the position of the ball; for (except in striking off from a hole, when the ball may be *teed*—i. e., placed advantageously on a little heap of sand, called a *tee*) it is a rule that the ball must be struck as it happens to lie. Some positions of the ball require a club with an iron head. The usual complement of clubs is six; but those who refine on the gradation of implements use as many as ten, which are technically distinguished as the *play-club, long-spoon, mid-spoon, short-spoon, baffing-spoon, driving-putter, putter, sand-iron, cleek,* and *niblick* or *track-iron*—the last three have iron heads, the others are of wood. Every player is usually provided with an attendant, called a *caddy*, who carries his clubs and "tees" his balls.

Digitized by Google

The object of the game is, starting from the first hole, to drive the ball into the next hole with as few strokes as possible; and so on round the course. The player (or pair of players) whose ball is holed in the fewest strokes has gained that hole; and the *match* is usually decided by the greatest number of holes gained in one or more rounds; sometimes it is made to depend on the aggregate number of strokes taken to "hole" one or more rounds.

To play the game of golf well requires long practice, and very few attain to great excellence who have not played from their youth. But any one may in a year or two learn to play tolerably, so as to take great pleasure in the game; and for all who have once entered upon it, it possesses no ordinary fascination. It has this advantage over many other outdoor games, that it is suited both for old and young. The strong and energetic find scope for their energy in driving long balls (crack-players will drive a ball above 200 yards); but the more important points of the game—an exact eye, a steady and measured stroke for the short distances, and skill in avoiding hazards—are called forth in all cases. Along with the muscular exercise required by the actual play, there is a mixture of walking which particularly suits those whose pursuits are sedentary—walking, too, on a breezy common, and under circumstances which make it far more beneficial than an ordinary "constitutional."

Golf Associations are numerous in Scotland, and in many instances the members wear a uniform when playing. Many professional players make their livelihood by golf, and are always ready to instruct beginners in the art, or to play matches with amateurs. The rules laid down by the St Andrews Royal and Ancient Union Club are those that govern nearly all the other associations, and may be found in "Chambers's Information for the People." No. 94. See also "Golf, a Royal and Ancient Game," by R. M. Clark (Edin. 1876).

GOLFO DULCE, in English, *Sweet* or *Fresh Gulf*, lies in the state of Guatemala, in Central America, measuring 26 miles by 11, and having an average depth of 6 or 8 fathoms. It communicates with the outer sea, here known as the Gulf of Honduras, by a narrow strait called the Ilio Dulce.

GO'LGOTHA, a Hebrew word signifying a "skull," and so it is interpreted by Luke; but by the other three evangelists, "the place of a skull." The Latin equivalent is *Calvaria*, "a bare skull." This place, the scene of the crucifixion of Christ, was situated without the gates of Jerusalem, on the eastern side of the city, although the common opinion handed down from the middle ages fixes it in the northwest (see CALVARY). It was probably the ordinary spot of execution, though this is to be inferred rather from the fact that, in the eyes of the Roman officers of justice, Christ was simply a common criminal, than from any supposed connection between the word "skull" and a place of execution; G. receiving its name in all likelihood from its round skull-like form. A church was built over the spot in the 4th c. by Constantine. What is *now* called the "Church of the Holy Sepulchre," to *the northwest* of Jerusalem, but within the walls of the city, has manifestly no claim whatever to be considered the building erected by Constantine; but while recent biblical scholars and travellers generally have assumed that the scene of our Saviour's crucifixion and sepulture is not ascertainable, a writer in Smith's "Dictionary of the Bible" offers strong reasons for believing that the present mosque of Omar, called by the Mohammedans "The Dome of the Rock," occupies the site of the sacred Golgotha.

GOLI'ATH. See GATH.

GOLIATH BEETLE (*Goliathus*), a genus of tropical coleopterous insects, of the section *Pentamera*, and remarkable for the large size of some of the species, particularly the African ones. They are also, in respect of their colors, splendid insects. Little is known of their habits.

GÖ'LLNITZ, a small town in the north of Hungary, in the county of Zips, is situated on the left bank of a river of the same name, a feeder of the Hernad, 17 miles south-west of Eperies. It has important iron and copper mines, and manufactures of wire and cutlery. Pop. (1869) 5205.

GO'LLNOW, a small manufacturing town of Prussia, in the province of Pomerania, is situated on the right bank of the Ihna, 15 miles north-east of Stettin. It was formerly a Hanse-town, and is surrounded by walls, and defended by two forts.

Digitized by Google

The manufactures are woollen cloth, ribbons, paper, and tobacco; there are also copper-works. Pop. (1875) 7917.

GOLOMY'NKA (*Comephorus Baikalensis*), a remarkable fish, found only in Lake Baikal, the only known species of its genus, which belongs to the goby family. It is about a foot long, is destitute of scales, and is very soft, its whole substance abounding in oil, which is obtained from it by pressure. It is never eaten.

GOLO'SHES (formerly called galoshes), from *Galoche*, a word through the French, from *Galocha*, the Spanish for a patten, clog, or wooden shoe. The French applied the term at first to shoes partly of leather and wood, the soles being wood, and the uppers of leather. The term was introduced to this country as a cordwainer's technicality, to signify a method of repairing old boots and shoes by putting a narrow strip of leather above the sole so as to surround the lower part of the upper leather. It was also adopted by the patten and clog makers to distinguish what were also called French clogs from ordinary clogs and pattens. Clogs were mere soles of wood with straps across the instep to keep them on; pattens were the same, with iron rings to raise them from the ground; but the galoshes were wooden soles, usually with a joint at the part where the tread of the foot came, and with upper leathers like very low shoes.

By the term goloshes is now generally meant the India-rubber over-shoes which were introduced into Great Britain from America about the year 1847; but it was some little time after this before the trade in them had reached much importance, as at first they were clumsily made, and of inferior quality. However, mainly by the exertions of the Hayward Rubber Company in America, their quality and appearance were soon much improved, and the demand for them increased rapidly. Many mills for their production were then started in America, and several were also set agoing in Great Britain, France, Germany, and Russia; but there are signs that the trade in these shoes is somewhat on the decline. In the populous districts of Great Britain, at all events, the demand for them now is not a fifth part of what it was twelve or fifteen years ago. Their comparative cheapness, however, still facilitates the sale of them in the outlying districts, and in poor countries generally.

As these shoes are at present made, they keep the stockings constantly damp, and the feet uncomfortable, by preventing the escape or the absorption of the perspiration. It is a little strange, too, that even when the uppers are almost entirely of some woven texture, and nothing but the sole of vulcanised rubber, they are not wholly free from this fault. Most kinds of rubber shoes have their separate pieces held together entirely by the adhesiveness of the rubber when treated by some solvent, such as turpentine. There are therefore no seams like those in a leather shoe, and this, taken along with the close texture of the rubber itself, is the cause of the discomfort we have mentioned. Still, when well made, they have several good qualities, such as their imperviousness to damp, as well as their softness, durability, and neatness. Leather shoes have become so costly, that one cannot but hope something will be done so to improve those made from this remarkable material, that they will at least retain their place as a partial substitute for leather ones.

The largest and best-conducted manufactory for the production of vulcanised rubber goloshes and other shoes in Great Britain, is that of the North British Rubber Company at Edinburgh. Here the material is prepared by processes which are to some extent described under the head CAOUTCHOUC. That is, the rubber is (1) torn up into small pieces, washed, and rolled together in granulated sheets. (2) It is then mixed, by the aid of heated rollers, with the vulcanising materials, consisting of sulphur, litharge, lamp-black, pitch, resin, and sometimes other materials. (3.) The final stage in the preparation of the material is done after the shoes are made, and consists in subjecting them for nine hours to a temperature of between 200° and 300° F. Rubber so treated is said to be vulcanised, for the properties of which see CAOUTCHOUC. After the rubber is thoroughly mixed with the materials we have mentioned, of which sulphur is the most essential, the so far prepared sheets of material are again rolled out between the heated rollers, till they are of the required thickness for the shoe uppers. For this purpose, the rollers, which are fitted into machines called calenders, are very carefully adjusted. The sheets for the soles are made in the same way; only, in their case, the rollers are so constructed

Digitized by Google

as to produce a certain breadth for the heels of an extra thickness, and to indent the surface with grooves, to prevent slipping. Both soles and uppers for each shoe are cut out separately with a knife, since the material will not admit of a number of these being cut at a time by dies, which, however, is done in the case of the linings, as they are of cotton or wool, and will not stick together by pressure. Thin metal moulds are used by the workmen for shaping the separate parts of a shoe—i. e., the rubber parts. The calico or other linings are coated round the edges with some strongly adhesive cement, probably dissolved rubber, and then all the pieces are ready to be put together.

Up to this stage, all the work has been done by men, but women actually make the shoes, a kind of work for which their nimble fingers are well suited. The lasts are of hollow cast-iron, and the company has no less than 170,000 pairs of them. Working with a number of lasts exactly the same, the girl first covers them with the various pieces of lining and insole, all of which are held together by the cement. Returning again to the first one, she now puts on the various outer pieces of the shoe, sticking them together quickly with a little turpentine at the junctions; and then by way of ornament, still more quickly runs a small notched wheel along where the seams in a leather shoe are, to finish her work. A clever girl will make fifty pairs a day: a very clever one, seventy. That is to make a pair of shoes in ten or twelve minutes. The next process is to coat the shoes with a varnish which gives them a beautiful gloss, and it is one of the great aims of the manufacturers to excel in this. Finally, they are put on light iron frames, and exposed to the heat of the vulcanising chamber.

In the India-rubber works of Edinburgh, more than twenty distinct kinds of boots and shoes are made, and their average production is 4000 pairs a day. Besides those worn in Great Britain, large numbers are exported to other countries, especially Germany, where, however, an inferior kind is largely made. For Norway and Sweden, a kind with warm felt lining has lately been much in demand.

GOLPE, in Heraldry, a Roundel purpure. It is sometimes called a *Wound*. See ROUNDEL.

GOMARISTS, or Contra-Remonstrants, the name by which the opponents of the doctrines of Arminius (q. v.), the founder of the Dutch Remonstrants, were designated. The party received this appellation from its leader, Francis Gomar. This theologian was born at Bruges, 30th January 1563, studied at the universities of Strasburg, Heidelberg, Oxford, and Cambridge, in the last-mentioned of which he took his degree of B.D. in 1584. In 1594 he was appointed professor of divinity at Leyden, and signalised himself by his vehement antipathy to the views of his colleague, Arminius. In the disputation between the Armenians and Calvinists, held at the Hague in 1608, his zeal was very conspicuous; and at the synod of Dort in 1618, he was mainly instrumental in securing the expulsion of the Arminians from the Reformed Church. He died at Gröningen in 1641. An edition of his works was published at Amsterdam in 1645. G., though stiff and bigoted in the last degree, and more Calvinistic than Calvin himself, was a man of various and extensive learning.

GOMBROO'N, called also BENDER or BUNDER ABBAS, a town and seaport of Persia, stands at the mouth of the Persian Gulf, in the Strait of Ormuz, and opposite the island of that name. Bender Abbas owed its name and importance to Shah Abbás, who, assisted by the English, drove the Portuguese in 1622 from Ormuz, or Hormuz, then a flourishing commercial town on the island of the same name, ruined the seaport, and transferred its commerce to Gombroon. For some time G. prospered abundantly, French, Dutch, and English factories were erected here, and the population rose to about 80,000. A dispute among the natives, however, resulted in the destruction of the European factories and houses, and only the remains of these now exist. Trade then almost entirely forsook G.; it is now inhabited by only about 4000 Arabs under a sheikh, who is subject to the sultan of Muscat, in Arabia. The town is surrounded by a mud wall; its streets are narrow and dirty.

GOME'RA, one of the Canary Islands (q. v.).

GOMO'RRAH. See SODOM AND GOMORRAH.

GOMU'TO, Areng, or Ejoo Palm (*Arenga saccharifera*, *Saguerus Rumphii*, of

Digitized by Google

Borassus gomutus), an important palm which grows in Cochin China and in the interior of Java, Sumatra, Celebes, and Amboyna, on dry ground. The stem is 20—30 feet high; the leaves 15—25 feet long, pinnated. The flowers are in bunches 6—10 feet long; the fruit is a yellowish-brown, three-seeded berry, of the size of a small apple, and extremely acrid. The stem, when young, is entirely covered with sheaths of fallen leaves, and black horsehair-like fibres, which issue in great abundance from their margins; but as the tree increases in age, these drop off, leaving an elegant naked columnar stem. The strongest of the fibres, resembling porcupine quills in thickness, are used by the Malays as styles for writing on the leaves of other palms. But the finer fibres are by far the most valuable; they are well known in eastern commerce as Gomuto or Ejoo fibre, and are much used for making strong cordage, particularly for the cables and standing-rigging of ships, European as well as native. Want of pliancy renders them less fit for running-rigging, and for many other purposes. They need no preparation but spinning or twisting. No ropes of vegetable fibre are so imperishable, when often wet, as those made of Gomuto fibre. At the base of the leaves of the Gomuto palm there is a fine woolly material, called *bara*, much employed in caulking ships and stuffing cushions. The saccharine sap, obtained in great abundance by cutting the spadices of the flowers, is a delicious beverage, and by fermentation yields an intoxicating wine (*neroo*), from which a spirituous liquor called *brum* is made. In Java, a brown sugar, much used by the natives, is made by boiling the sap.

GONAI'VES, a seaport of Hayti, with an excellent harbor, stands on a bay of its own name, which deeply indents the west coast of the island. It is 65 miles to the north-west of *Port Republicain*, formerly *Port au Prince*, the capital.

GO'NDAR, a city of Abyssinia, capital of the kingdom of Gondor or Amhara, is situated in lat. 12° 36′ n., and 37° 29′ e., on an insulated hill at an elevation of 7420 feet above sea level, and is 30 miles distant from the northern shore of Lake Dembea or Izana (see ABYSSINIA). G. is the seat of the archbishop of Abyssinia, and was formerly the residence of the emperor or *Negus*. At one time it had from 50 to 100 churches and about 50,000 inhabitants; its population numbers at present about 7000 only, but the latest returns shew 44 churches, with nearly 1200 priests, besides numerous monks and nuns. It is poorly and irregularly built, and resembles a wood rather than a city, on account of the number of trees surrounding the houses. The palace, a square stone structure flanked with towers, is the most important building. There are no shops or bazaars, all the articles for sale being exposed on mats in the market-place. G. has manufactures of fire-arms, sword-blades, knives, scissors, razors, shields, pottery, &c.; and a considerable transit trade between Massuah on the Red Sea and the south of Abyssinia, in slaves, musk, wax, ivory, coffee, honey, &c. The mean temperature of G., as observed by Rüppell during the seven months from October to April inclusive, was 69°, and the lowest temperature during that time was 53·09°. A great quantity of rain falls here. As late as the middle of the 18th c. G. was capital of Abyssinia.

GONDOKORO, a town in the country of the Bari negroes, on the Upper Nile, in 4° 54′ n., 31° 28′ e. It is a centre of the ivory trade, and before its annexation to Egypt by Sir Samuel Baker in 1871, was also a centre of the East African slave trade. A Catholic mission was established here in 1849 under Dr Knoblecher, but was discontinued in 1853, owing to the unhealthiness of the climate—sixteen out of twenty-four of the missionaries having succumbed to it during the short period of the existence of the mission.

GO'NDOLA (Italian), a long narrow boat (averaging 30 feet by 4) used chiefly on the canals of Venice. The prow and stern taper to a point, and curve out of the water to a height of at least 5 feet. In the centre there is a curtained chamber for the occupants. The boat is propelled by means of oars or poles by one, two, or occasionally four men. The rowers stand as they row, and wear the livery of the family to which the gondola belongs.

The term gondola is also applied to passage boats having 6 or 8 oars, used in other parts of Italy.

GONDWANA, the land of the Gonds, is a hilly tract of Hindustan lying between 19° 50′ and 24° 30′, and in e. long. between 77° 38′ and 87° 20′. It occupies a some-

Digitized by Google

what central position, sending its drainage at once northward into the Jumna, eastward through the Mahanadi into the Bay of Bengal, and westward through the Tapti and the Nerbudda into the Arabian Sea—the water shed in some places attaining an elevation of 5000 feet. So isolated a locality, besides being in itself unfavorable to civilisation, is rendered still more so by the extreme barbarism of the inhabitants, who are regarded, with some appearance of probability, as the genuine aborigines of India. Certain it is, that the country has never really formed a part of any of the great empires in the east.

GO'NFALON (Ital. *gonfalone*), an ensign or standard, in virtue of bearing which, the chief magistrates in many of the Italian cities were known as gonfaloniers.

GONG, an Indian instrument of percussion, made of a mixture of metals (78 to 80 parts of copper, and 22 to 20 parts of tin), and shaped into a basin-like form, flat and large, with a rim of a few inches deep. The sound of the G. is produced by striking it, while hung by the rim, with a wooden mallet, which puts the metal into an extraordinary state of vibration, and produces a loud piercing sound.

GONGORA, Luis Y. Argote, a Spanish poet, was born at Cordova, 11th July 1561; studied law at the university of Salamanca, where he composed the greater part of his erotic poems, romances, and satires. At the age of 45, he took orders, and obtained a small prebend in the cathedral of Cordova. He was afterwards appointed chaplain to Philip III., and died in his native city, 24th May 1627. G.'s poetic career divides itself into two periods. In his *first* or youthful period, he yielded himself up entirely to the natural tendencies of his genius, and to the spirit of the nation. His lyrics and romances of this period are in the old genuine Spanish style; and in regard to their caustic satire and burlesque wit, are among the most admirable specimens of the class of poems to which they belong. G., however, wished to outdo all his predecessors, and to furnish something wholly new and unheard of; the result of which unfortunate ambition was the introduction of a new poetic phraseology, called the *estilo culto*, or the "cultivated style." From this point the *second* period in G.'s literary career dates. To popularise the *estilo culto*, he wrote his "Polifemo," "Soledades," and the "Fables of Pyramus and Thisbe," productions of the most pedantic and tasteless description, poor in invention and thought, but rich in high-sounding pompous phrases, and overloaded with absurd imagery, and mythological allusions, expressed in language of studied obscurity. In this way he became the founder of a new school, the *Gongoristas*, or *Culloristas*, who even surpassed their master in the depravity of their literary tastes. The most complete edition of G.'s works is that by Gonzalo de Florez y Cordoba (Mad. 1633). Some of his romances have been translated into German by J. G. Jacobi (Halle, 1767).

GONIATI'TES, a genus of fossil cephalopodous mollusca, belonging to the same family as the ammonites. The genus is characterised by the structure of the septa, which are lobed, but without lateral denticulations, as in ammonites; they consequently exhibit, in a section, a continuous undulating line. Some forms with slightly waved septa approach very near to the nautilus, from which, however, they are at once separated, by the position of the small and delicate siphuncle, which is on the dorsal or external side of the shell. The lines of growth on the external surface have a sigmoid direction. The siphonal portion is shorter than the sides, forming a sinus at the back, as in the nautilus. The last chamber, the one tenanted by the animal, occupies a whole whorl, and has besides a considerable lateral expansion. The shells are small, seldom exceeding six inches in diameter.

This genus is confined to the Palæozoic strata: upwards of 150 species have been described from the Devonian, Carboniferous and Triassic measures.

GONI'DIA (Gr. *gonē*, generation, and *eidos*, an appearance), small green bodies which in some cryptogamous plants serve the purpose of reproduction, but apparently after a manner analogous to that of bulbils in phanerogamous plants, rather than by true fructification. It is not, however, certain that the bodies called gonidia in different classes of cryptogamous plants are all of exactly the same nature. The gonidia of Lichens (q. v.) are found in layers in the interior of the thallus. In some of the lowest vegetable organisms, as *Desmidiaceæ*, the gonidia are formed by the *endochrome* or contents of the cell breaking

Digitized by Google

up into granules, sometimes invested with cilia, and moving as zoospores, at first within the cavity of the cell in which they are formed, and afterwards without it.

GONIO'METER, an instrument for measuring the angles of crystals. The simplest instrument is that invented by Carangeau, which consists of two brass rulers turning on a common centre, between which the crystal is so placed that its faces coincide with the edges of the rulers, and the angle is measured on a graduated arc. For large crystals this is sufficiently accurate, but as many minerals are found crystallised only in small crystals, and as small crystals of any mineral are generally the most perfect, an instrument capable of measuring more exactly was required. The one generally in use is the reflecting goniometer invented by Wollaston, and improved by Naumann. This is a more complicated instrument, yet easy of application, and it will measure very small crystals with certainty to within a single minute (1′). The angle is measured by the reflection of the rays of light from the surface of the different faces of the crystal.

GONORRHŒ'A, described also as BLENNORRHAGIA by some writers, is the most common form of venereal disease. It has been known from very remote times; it is generally believed that the sanitary measures inculcated in the 15th chapter of Leviticus have reference to this disorder as occurring amongst the Jews; and it was described by the Greek and Roman physicians. It consists in an inflammation of the mucous membrane of some part of the generative organs, producing a mucopurulent or purulent discharge from the diseased surface. Hence its name of gonorrhœa, which is formed on the erroneous supposition that the discharge consists of the spermatic fluid, is unsuitable, and the attempt to substitute blennorrhagia, which signifies "a flow of mucous matter," has been made. Although it is termed a venereal disease, it is totally distinct from Syphilis (q. v.). Although gonorrhœa is, in the great majority of cases, the result of direct contagion from sexual intercourse with a person who is similarly affected, there is no doubt that a very similar urethral discharge may arise from constitutional and other causes irrespective of contagion, as in scrofulous, gouty, or rheumatic subjects. Moreover it is certain that this disease in the male may proceed from intercourse with a woman in whom no morbid change of the mucous membrane can be detected by the speculum. Ricord, a French physician of great authority in this department of medicine, lays down the proposition, that "gonorrhœa often arises from intercourse with women who have not had the disease." Diday, another high authority, maintains "that from the very fact of a woman having a discharge, no matter what its origin, she is liable to give a discharge to a man." English surgeons are gradually taking a similar view, and admit that gonorrhœa may be the product of other causes than a specific poison. The fact of the disease being usually caused by impure intercourse is proof of the presence and action of the poison, but is no evidence of that poison being of a specific character; any poison capable of being generated by simple inflammation being probably sufficient to induce the disease.

Men are so much more liable to contract this disease than women, that we shall confine our remarks to gonorrhœa in the male. The symptoms usually appear in from three to five days after exposure to contagion. The patient feels an itching or tingling sensation at the extremity of the urethral passage, whose orifice has an abnormally florid appearance, and is usually closed by a viscid, colorless secretion. This premonitory stage may last for a day or two, when there is swelling of the parts, and a thick cream-like pus exudes from the urethra. The passage of the urine is accompanied by a smarting or scalding sensation, and takes place with considerable difficulty, in a contracted or twisted stream. At night, a painful condition of the parts, known as chordee, and due to spasm of the muscular fibres of the urethra, is apt to come on. This stage may last, with slight variations, for a space varying from one to three weeks, its length depending on the patient's mode of life, and the number of previous attacks, the first being always the worst, and each succeeding one being gradually milder. The disease having thus reached its height, gradually subsides; the various symptoms abate in severity, and after a period of uncertain length, the discharge either ceases or assumes an almost entirely mucous character. If it ceases, the patient may be regarded as cured; if the mucous discharge continue, is known as *gleet;* and it is only to this condition that the term blennorrhagia is

Digitized by Google

truly applicable. This gleet often remains, in defiance of all treatment, for months, and its presence often preys very unnecessarily upon the patient's mind, so as to derange his health, and to suggest unnecessary fears regarding the loss of his virile powers. It is from patients of this kind, who cannot be persuaded that the discharge is unaccompanied by any further mischief to themselves (further than possible annoyance arising from the fact that they should not marry so long as *any discharge* exists), and that it is sure in due time to cease, unless there is stricture or some other exciting cause, that advertising quacks draw their greatest profits.

There are considerable discrepancies of opinion amongst the highest medical authorities regarding the treatment of this disease. Various quack medicines, in the form of prophylactic washes, to be employed after exposure to possible contagion, are daily advertised in certain cheap and disreputable journals; but as Dr Druitt somewhat quaintly but very truly remarks: "The only prophylactic to be relied on is chastity; next to this, soap and water, followed by an alum wash." To these directions he might have added, that the urine should be discharged as soon as possible afterwards, so as to wash out the urethral passage. If the patient apply for advice on the first suspicion of the disease, before any acute inflammatory symptoms have set in, and if he can devote his whole time to his cure, he should keep a constantly recumbent position, should live on a farinaceous diet, avoiding meat, wine, and beer, and the *abortive* treatment should be tried. This consists in the injection into the urethra, every four or six hours, by means of a glass syringe, of a solution of two grains of nitrate of silver in eight ounces of distilled water. By about the second day, the discharge will begin to lessen, and the use of the injection must be stopped; and if any tinge of blood has appeared in the discharge, the remedy must *at once* be discontinued. If the diminution extend in a few days to a total disappearance of the discharge, the patient is cured; if a slight discharge continue, a weak solution of sulphate of zinc (one grain to the ounce) may be injected two or three times daily for a few days. During this treatment, the bowels should be kept freely open by an antimonial saline mixture, and the patient should drink freely of barley-water, linseed-tea, and similar mucilaginous fluids. If this treatment be adopted at the very first, we can usually cut short, in a week, an affection that might possibly be troublesome for months; if it be tried after inflammation is fairly established, it is very apt to give rise to *stricture*. If a patient does not seek advice till the acute stage has set in, perfect rest in the recumbent position should be insisted on; but if, as is too often the case, the patient is unable to carry out this important regulation, all exercise must be avoided as far as possible, and the parts affected should be properly supported by a bandage, specially sold for that purpose, and termed a suspensory bandage. A very low, unstimulating diet must be insisted on, and all stimulating drinks strictly prohibited, while he should partake freely of mucilaginous diluents; and as a medicine, an alkaline saline diuretic should be prescribed, such as a combination of a scruple of acetate or bicarbonate of potash, half a drachm of tincture of henbane, and twenty minims of nitrous ether, with a little tartar emetic in urgent cases, administered in a small tumbler of water, containing a little gum in solution, or of barley-water, three times a day. As an outward local application, nothing is better or more soothing than water as hot as the patient can bear it. When, under these means, the scalding pain in micturition and the local swelling subside—but not till then—certain medicines which exert a special influence on inflamed mucous membranes—viz., copaiva and cubebs—should be administered. Copaiva may be administered in half-drachm doses three or four times daily; and after a few days, the dose may be increased, if necessary, to double that amount. Under no conditions can it be made an agreeable medicine. Some practitioners combine it into an emulsion with yolk of egg, liquor potassæ, or gum-arabic; others recommend that it should be taken floating on a wine-glassful of water to which a little tincture of orange-peel has been added. If the gelatine capsules of copaiva can be depended on as being genuine, they afford an easy mode of taking this medicine. In whatever form it is taken, it is liable to produce an eruption of the skin, consisting of small red patches somewhat resembling nettle-rash. Although the rash is perfectly harmless, and speedily disappears on the discontinuance of the medicine, and the administration of one or two saline purgatives,

Digitized by Google

it often causes great alarm to a patient who has not been duly warned of its possible occurrence. Cubebs is a less unpleasant medicine than copaiva. To be of service, at least a drachm of the powder should be taken three times a day suspended in milk. A confection formed by mixing powdered cubebs with balsam of copaiva, which may be swallowed as a bolus with an envelope of moistened rice-paper, is an efficacious form of prescribing these medicines. In the third stage, when the urgent symptoms are abating, the patient should continue the use of copaiva and cubebs, and should begin to use injections, commencing with one composed of a scruple of bismuth and half a grain of acetate of morphia in an ounce of water containing sufficient mucilage to keep the bismuth in suspension, to be used thrice daily. After a few days, it may be replaced by one of sulphate of zinc (one grain to an ounce of water), which may be increased in strength if necessary. If a gleet remains, it must be treated with tonic medicine, especially tincture of iron, exercise in the open air, sea-bathing, good diet, &c.; and the under-side of the urethra may be painted with tincture of iodine, or in very obstinate cases, treated with a slip of blistering tissue. A well-marked case of gonorrhœa, when left entirely to itself, rarely runs a shorter course than from three to four months. Various forms and complications of gonorrhœa occur, into which it is unnecessary for us to enter in this work.

As has been mentioned in the article OPHTHALMIA, the purulent discharge of gonorrhœa, if brought in contact with the conjunctiva, may occasion destructive disease of the eye. There is also a troublesome affection, accompanied by pain, swelling, and tenderness of the joints, with feverishness, which is apt to supervene towards the decline of the discharge, which is known as *gonorrhœal rheumatism*.

From what has been stated regarding the so-called *abortive* treatment, it is obvious that, by applying for medical aid on the earliest suspicion of contagion, the patient may save himself from a long and troublesome disease, which, if neglected or badly treated, may give rise to a serious local affection—namely, stricture of the urethra. As patients with diseases of these organs are apt to entertain remarkable and altogether erroneous views as to their constitutions being irretrievably ruined, and to the possible outbreak of secondary and tertiary symptoms, it is the duty of the practitioner always to impress upon them that, as a general rule, gonorrhœa is merely a local affection, and cannot give rise to any subsequent constitutional symptoms.

GONVILLE AND CAIUS COLLEGE, Cambridge, was originally founded in 1348, by Edmund Gonville, son of Sir Nicholas Gonville, rector of Terrington, in Norfolk, and endowed for a master and three fellows. In 1353, William Bateman, Bishop of Norwich, whom Gonville had appointed his executor, removed the college to its present site, and altered the name to the "Hall of the Annunciation of Blessed Mary the Virgin." In 1558, Dr Caius obtained a royal charter, founding the college for the third time, and altering the name to that which it now bears. By statute, the college consists of a master, thirty fellows, and thirty-six scholars; but two fellowships have been added—one in 1865, another in 1870. There are also five college studentships in medicine, founded by Christopher Tancred, each of the annual value of £100.

GONZAGA, House of, a princely family of German origin, from which sprang a long line of sovereign Dukes of Mantua and Montferrat. The sway of this race over Mantua extended over a period exceeding three centuries, and many of its members were magnificent promoters and cultivators of arts, science and literature. Wielding originally in the state the vast civic influence which in so many instances we find exercised by families of weight in the history of Italy, the Gonzagas gradually monopolised all the chief posts of command, both civil and military; and finally, in 1432, were invested with the title and jurisdiction of hereditary marquisee, and in 1530 with that of dukes or sovereigns of the state. After their elevation to ducal dignity, they continued to own the feudal supremacy of the empire, and were the faithful champions of the imperial interests in their policy with other states. The House of G. and that of the Visconti Dukes of Milan were perpetually at war. The most illustrious personages of this race were GIOVANNI FRANCESCO (1407—1444), in whose favor Mantua was created a marquisate by the Emperor Sigismund, in return

Digitized by Google

for his services to the empire.—GIAN FRANCESCO (1484—1519), who defeated Charles VIII. of France at the battle of Fornovo, on the banks of the Taro, 1495, when G. left 2500 troops on the field and Charles was forced to a hasty retreat. G. also took part in the engagement of Atella, 1496, which led to the capitulation of the French forces. His son, FREDERICK II. (1519—1540), in recognition of the services he rendered the imperial forces in their contest with France, was invested by the Emperor Charles V. with the ducal dignity in 1530, and also obtained the marquisate of Montferrat in 1536. During the reign of this prince, the court of Mantua was one of the most magnificent and gay of Europe.—GUGLIELMO (1550—1587), the son of Frederick, was humpbacked, but proved a wise and enlightened ruler; his secretary was Bernardo Tasso, father of the poet.—VINCENZO (1587—1612), son of Guglielmo, was the warm friend and patron of Tasso, and succeeded in obtaining the poet's freedom, when he was confined as insane by the Duke Alfonso d'Este.—Vincenzo was much esteemed for his piety, justice, and liberality. He was successively followed by his three sons, Francesco, Ferdinando, and Vincentio, who died without heirs, and thus the direct line of the ducal branch became extinct. A collateral branch, in the person of Charles I., Duke of Nevers, son of Ludovico, the brother of Guglielmo the humpbacked, claimed the Duchy, which was contested by his cousin Cæsar, Duke of Guastalla. This family feud led to a general war, in which France supported Nevers, and the empire claimed the right of adjudging Mantua, as an imperial fief, to a candidate of imperial election. Mantua in 1629 was stormed, sacked, and stripped of all its magnificent possessions, by the imperialists, and never regained its former splendor. Charles de Nevers submitted finally to the emperor, and was installed in the duchy. The artistic treasures collected for ages by the G. princes were scattered throughout Europe, and came into possession of several of the reigning sovereigns. The successors of Charles were dissipated and silly, and the tenth and last Duke of Mantua, Ferdinand-Charles, was the most contemptible and dissolute of all. As he had countenanced the French in the War of the Succession, the Emperor Joseph I. deprived him of his states, placing him under the ban of the empire. He died in exile in 1708, leaving no issue.

GONZALVO DI CORDOVA (G. Hernandez y Aguilar), a celebrated Spanish warrior, was born at Montillo, near Cordova, in 1453. He served with great distinction first in the war with the Moors of Granada, and afterwards in the Portuguese campaign. At the close of the final contest with Granada, he concluded the negotiation with Boabdil (Abu Abdallah), king of the Moors, in such a masterly manner, that the rulers of Spain bestowed upon him a pension and a large estate in the conquered territory. He was next sent to the assistance of Ferdinand, king of Naples, against the French. In less than a year, G., with his limited resources, had conquered the greater part of the kingdom, and obtained the appellation of "El Gran Capitano." In conjunction with King Ferdinand, he succeeded in completely expelling the French from Italy; and in August 1498 returned to Spain, having received in return for his valuable services an estate in the Abruzzi, with the title of Duke of San Angelo. When the partition of the kingdom of Naples was determined upon by a compact entered into at Granada, 11th November 1500, G. again set out for Italy, with a body of 4300 men, and on the way took Zante and Cephalonia from the Turks, and restored them to the Venetians. He then landed in Sicily, occupied Naples and Calabria, and demanded from the French that, in compliance with the compact, they should yield up Capitanata and Basilicata. This demand being rejected, a war broke out between the two belligerent powers, which was waged with varied success. After the victory of Cerignola, in April 1503, G. took possession of Calabria, Abruzzo, Apulia, even the city of Naples itself, and then laid seige to Gaëta, but was forced to retreat before a superior force of the enemy. On the 29th December of the same year, however, he fell upon them unexpectedly near the Garigliano, and obtained a complete victory, 29th December 1503. The French army was almost annihilated; the fortress of Gaëta fell; and the possession of Naples was secured to the Spaniards. King Ferdinand bestowed the duchy of Sessa upon the conqueror, and appointed him viceroy of Naples, with unlimited authority. His good-fortune, however, made him many powerful enemies; and G. was recalled to Spain, where the king treated him with marked neglect. G. now betook himself to his estates in Granada; but after the defeat of the new vice-

Digitized by Google

roy in Naples by Gaston de Foix, he was again appointed to the command of the Spanish-Italian army. Mental suffering, however, had undermined the old hero's health, and on the 2d December 1515 he died at Granada.

GOOD, John Mason, a physician and author, was born at Epping in Essex, 1764, and died in London in 1827. He commenced practice as a surgeon in Sudbury in 1784, but meeting with little success, he removed to London in 1793, principally with the view of obtaining literary employment.

In addition to "The Book of Nature," the work by which he is now chiefly known, and which only appeared shortly before his death, he published various poems, translations, and professional treatises. Of his original poems we need say nothing. Amongst his translations we may notice his "Song of Songs, or Sacred Idylls," translated from the Hebrew, 1803; his translation of Lucretius, in verse, in 1805; of the Book of Job, in 1812; of the book of Proverbs, in 1821; and of the Book of Psalms, which was just completed at the time of his death. His chief professional work, his "Study of Medicine," in four volumes, was published in 1822. It is a learned and amusing work, but by no means a trustworthy guide to the medical student. He likewise published, in conjunction with Olinthus Gregory and Bosworth, the "Pantologia, or Encyclopœdia, comprising a General Dictionary of Arts, Sciences, and General Literature," in twelve volumes, which were completed in 1813; and contributed largely to various periodicals. His friend, Dr Olinthus Gregory, published a Memoir of his Life in 1828.

GOOD BEHAVIOR, a phrase rather popular than legal. It is used chiefly as synonymous with keeping the peace. Thus, if one person assaults another, or threatens or provokes him to a breach of the peace, the offence is punishable summarily by justices of the peace, who, besides inflicting a fine, may, and often do, bind over the offending party to keep the peace, and be of good behavior for a period of six or twelve months. The mode of doing this is by requiring the offending party to enter into his recognizances with or without sureties, which is, in fact, the giving a bond for a specified sum to the crown, and if it is broken, that is, if the recognizance is forfeited, then the party may be again punished.

GOOD-CONDUCT PAY is an addition made in the British army to the daily pay of corporals and private soldiers, in consideration of long service unaccompanied by bad behavior. The amount awarded at one time is 1*d.* a day, with one white chevron on the arm as a badge of distinction. Successive awards of good-conduct pay may raise the total grant to 6*d.* a day, with a corresponding number of stripes on the arm. It reckons, in part, towards increase of pension when the soldier quits the service.

In each regiment there is kept a "Regimental Defaulters' Book," in which the commanding officer is bound to enter the name of every soldier in the corps who shall have been convicted by court-martial of any offence, or who, in consequence of misconduct, shall be subjected to forfeiture of pay, either with or without imprisonment, or to any other punishment beyond seven days' confinement to barracks. No first or subsequent 1*d.* of good-conduct pay can be awarded to a soldier, unless two continuous years have elapsed without his name being thus recorded; and if he have the misfortune to come within the provisions of this black book while actually in receipt of good-conduct pay, he loses for each offence 1*d.* per diem, which can only be restored after one uninterrupted year of good service, during which his name has not been recorded in the defaulters' book. The loss of the 1*d.* is of course accompanied by the loss of the corresponding distinguishing mark or stripe.

The first 1*d.* is obtainable after two years' service, without the name once appearing in the defaulters' book; the second, after six years; the third, after 12 years; the fourth, after 18 years; the fifth, after 23 years; and the sixth, after 28 years; the service being only reckoned in any case from the age of eighteen, and two years of uninterrupted good conduct immediately before the time at which the award is granted being requisite in every instance. As an additional inducement to continuous good behavior, 14 uninterrupted years without an adverse entry entitles a soldier, after 16, 21, or 26 years' service, to the award for which he would only otherwise be eligible after 18, 23, or 28 years.

Non-commissioned officers do not receive good-conduct pay, an addition instead

Digitized by Google

thereof of 3d. per diem having been made to their regular pay a few years since. A sum, however, not exceeding £4900 a year is distributed among sergeants of long service and good conduct, in the way of annuities, not over £30 each. The annuity is receivable during active service, and also in conjunction with the pension on retirement.

In the Malta Fencible Artillery, good-conduct pay is allowed to native soldiers for similar periods of service, but to only half the above amount.

A considerable increase of the army causes a large decrease in the sum payable for good-conduct pay, as the older soldiers become non-commissioned officers, and the ranks are swelled by young recruits, who have not yet had time to earn these extra rewards. The total charge in the army for good-conduct pay during the year 1876—1877 was £150,000.

Good-conduct pay and badges are also awarded in the navy to seamen of exemplary conduct; but the periods for obtaining, and the rules under which it is granted and forfeited, so nearly resemble those in force for the army, that a separate description is unnecessary. The leading differences are, that the grant is limited to three badges, and 3d. a day; that petty officers continue to hold it; and that it is of no account in the pension given at the expiration of active service.

GOOD FRIDAY, the Friday before Easter, sacred as the commemoration of the crucifixion of our Lord. This day was kept as a day of mourning and of special prayer from a very early period. It was one of the two paschal days celebrated by the Christian Church, and in memory of the crucifixion, was called by the Greeks *Pascha Stauroisimon*, or the "Pasch of the Cross." That it was observed as a day of rigid fast and of solemn and melancholy ceremonial, we learn from the apostolic constitutions (b. v. c. 19), and from Eusebius ("Eccl. Hist." b. ii. c. 17), who also tells that, when Christianity was established in the empire, Constantine forbade the holding of law-courts, markets, and other public proceedings upon this day. In the Roman Catholic Church, the service of this day is very peculiar; instead of the ordinary mass, it consists of what is called the Mass of the Presanctified, the sacred host not being consecrated on Good Friday, but reserved from the preceding day. The priests and attendants are robed in black, in token of mourning; the altar is stripped of its ornaments; the kiss of peace is omitted, in detestation of the kiss of the traitor Judas; the priest recites a long series of prayers for all classes, orders, and ranks in the church, and even for heretics, schismatics, pagans, and Jews. But the most striking part of the ceremonial of Good Friday is the so-called "adoration of the cross," or, as it was called in the old English popular vocabulary, "creeping to the cross." A large crucifix is placed upon the altar with appropriate ceremonies, in memory of the awful event which the crucifix represents, and the entire congregation, commencing with the celebrant priest and his ministers, approach, and upon their knees reverently kiss the figure of our crucified Lord. In the eyes of Protestants, this ceremony appears to partake more strongly of the idolatrous character than any other in the Roman Catholic ritual; but Catholics earnestly repudiate all such construction of the ceremony. See IDOLATRY; IMAGES. The very striking office of "Tenebræ" is held upon Good Friday, as well as on the preceding two days: it consists of the matins and lauds of the office of Holy Saturday and has this peculiarity, that at the close all the lights in the church are extinguished except one, which for a time (as a symbol of our Lord's death and burial) is hidden under the altar.

In the English Church, Good Friday is also celebrated with special solemnity. Anciently, a sermon was preached at St Paul's Cross on the afternoon of this day, at which the lord mayor and aldermen attended. The practice of eating upon this day "cross buns"—cakes with a cross impressed upon them—is a relic of the Roman Catholic times, but it has lost all its religious significance. In England and Ireland, Good Friday is by law a *dies non*, and all business is suspended. In Scotland, the day meets with no peculiar attention, except from members of the Episcopal and Roman Catholic communions.

GOOD HOPE. See CAPE OF GOOD HOPE.

GOODALL, Frederick, an eminent English artist, the son of Edward Goodall, an engraver of reputation, was born in London, September 17, 1822. His first oil-picture was entitled, "Finding the Dead Body of a Miner by Torchlight," for which

Digitized by Google

the Society of Arts awarded him the large silver medal. During the summers of 1838—1842, he visited Normandy and Brittany, and in 1839, when but 17 years of age, he exhibited his first picture at the Royal academy "French Soldiers Playing Cards in a Cabaret." His "Entering Church," as well as "The Return from a Christening," which received a prize of £50 from the British Institution, and others of his early pictures, were purchased by Mr Wells. "The Tired Soldier," exhibited in 1842, was purchased by Mr Vernon, and is now in the Vernon Gallery. Some of his French scenes are, "Veteran of the Old Guard describing his Battles," "La Fête du Mariage," "The Wounded Soldier Returned to his Family." "The Conscript." In 1844, he went for subjects to Ireland, and subsequently visited North Wales. Among his Irish scenes are, "Irish Courtship," "The Irish Piper," and the "Departure of the Emigrant Ship." "The Village Festival," one of the best of his English subjects, exhibited in 1847, was purchased by Mr Vernon. His "Hunt the Slipper" (1849), "Raising the Maypole" (1851), "Arrest of a Peasant Loyalist—Brittany, 1793" (1855), "Cranmer at the Traitor's Gate" (1856), "Rising of the Nile," "Subsiding of the Nile," "An Intruder on the Bedouin's Pasture" (1876), &c., have also added greatly to his reputation. He visited Egypt in 1858. In 1852, G. was elected an Associate of the Royal Academy, and in 1868, a Royal Academician.

GOODENIA'CEÆ, a natural order of exogenous plants, of which about 150 species are known, mostly herbaceous plants, although a few are shrubs, and mostly natives of Australia and the islands of the Southern Ocean, a few being also found in India, the south of Africa, and South America. The order is allied to *Campanulaceæ* and *Lobeliaceæ*, but is destitute of the milky juice which is found in both of these. The corolla is monopetalous, more or less irregular. A remarkable character of this order is that the summit of the style bears a little cup, in the bottom of which the stigma is placed. The flowers of some of the species are of considerable beauty. The young leaves of *Scævola taccada* are used as a salad by the Malays; and the pith furnishes a kind of *rice-paper*, which they make into artificial flowers and other ornaments.

GOODS AND CHATTELS, a legal as well as popular phrase in common use, to signify personal property. It is not unfrequently used in wills, but seldom in any other legal instrument; and when used in wills, it generally includes all the personal property of the testator. In Scotland, the corresponding phrase is goods and gear.

GOODS IN COMMUNION, the name given in the law of Scotland, France, and some other countries, to the personal property of a married couple, which is not subject to any deed, but left to the operation of the common law. In England, such a phrase is unknown, for upon marriage, all the personal property which previously belonged to the woman (which is not secured by any deed or will), as well as what was previously his own, becomes and continues the husband's absolutely—he is entire master of it, and can do what he likes with it, regardless of the wishes of his wife or children, and he may even bequeath it away to strangers. In Scotland, the theory is not so liberal towards the husband, though in practice there is not much difference. By the law of Scotland, the husband can also do what he likes with the personal property of both parties, if there is no previous marriage-contract or other deed governing the subject-matter. He can almost squander it at will. It is only at his death that the theory of a kind of partnership, or of a communion of goods, comes into play.

Until 1855, when the law was altered, this theory prevailed when the wife died, for formerly, at her death, the goods were divided into two parts, if there were no children, and one-half went to the next of kin of the wife, however distant the relationship, and not to the husband. But now, by statute 18 Vict. c. 23, s. 6, when a wife dies before the husband, her next of kin takes no interest whatever in the goods in communion; and the law in this respect is now the same as it is in England. Hence the phrase goods in communion is less appropriate than it was before 1855. If, however, the husband die, the goods in communion suffer a division on the principle of a partnership. Thus, if there are no children, half goes to the widow, and the other half to the next of kin of the husband. If there are children, then one-third goes to the widow, and is often called her *Jus Relictæ* (q. v.), and the other two-thirds to the children equally, if there is no will; or if there is a will, then one-third to them, called the *Legitim* (q. v.). The same division also takes place

Digitized by Google

in England, when there is no will; but this is done in England by virtue of a statute 29 Charles II. c. 3, called the Statute of Distributions (q. v.), whereas this effect is produced in Scotland not by a statute, but by the common law. Practically, this distinction, though important to be known by lawyers, may seem immaterial to laymen.

Another more important distinction, however, both theoretically and practically, is this: The above division of the goods in communion prevails in Scotland whether the husband has left a will or not; in short, it prevails in spite of his will, and all that a husband having a wife and children can do by means of a will, is to bequeath one-third of his personal estate to strangers, and this third is usually called on that account the *Dead's Part* (q. v.). Thus, in Scotland, on the death of the husband, the wife and children have an indefeasible interest in two-thirds of his personal property, and this inchoate interest during life gave rise to the phrase "goods in communion." In England, on the contrary, the will, if there is one, may carry away all the personal property to strangers, regardless of the wife and children. Hence, the result may be stated shortly thus: in Scotland, a man cannot disinherit his wife and children; whereas in England he can. See other incidents of this distinction in Paterson's "Compendium of English and Scotch Law," ss. 673, 738. If there is a marriage-contract or antenuptial settlement between the husband and wife, the rights both of the wife and children may be materially varied, for the rule then is, that the parties may make what arrangement they please by way of contract, and in such settlements a fixed sum is generally provided both to the wife and children, in lieu of what they would be entitled to at common law, i. e., where no express contract is made.

GOODSIR, John, Professor of Anatomy in the university of Edinburgh from 1846 to 1867, was born in 1814, at Anstruther, Fifeshire, in which county his father and grandfather had, for many years, practised the profession of medicine with great repute. Very early in life, his studious habits and thoughtful disposition attracted attention, and when little more than a boy, he was sent to the university of St Andrews, where he passed through a four years' course of literary and philosophic study. He was afterwards apprenticed to Mr Nasmyth, dentist in Edinburgh, and during his apprenticeship, attended the medical classes both in the university and extra-mural school in that city. He studied anatomy under Dr Knox, and natural history under Professor Jameson, and was the intimate friend of Edward Forbes, George Wilson, Samuel Brown, and other young men, who have since made for themselves names as ardent students of the natural sciences.

The position of his native town on the sea-coast had very early caused his attention to be directed to marine zoology, and along with his younger brother, Harry, who was afterwards lost in the unfortunate Franklin Expedition, he had begun to dissect marine animals, and study their forms and structure, before he commenced his medical studies. His training as a dentist led him to undertake an investigation into the Development and Structure of the Teeth, which he afterwards published in an elaborate memoir, and in which he gave the first consistent account of the various stages through which these important organs pass. This Essay, published in 1839, at once caused him to be recognised as an observer of great originality and acuteness. On obtaining his diploma at the College of Surgeons, in Edinburgh, he returned to Anstruther, to assist his father in practice; and though actively engaged for some years in the arduous duties of a country doctor, he yet found time, not only to pursue numerous important pathological investigations, but to continue and extend his studies in anatomy and natural history. He formed at the same time an Anatomical Museum, characterised by the great beauty of the preparations, which was afterwards acquired by the government for the use of the Queen's College, Cork.

He returned to Edinburgh about 1840; and on the conservatorship of the Museum of the Royal College of Surgeons becoming vacant, he applied for, and obtained, the office. Having now acquired a more extensive field for pathological research, he devoted much attention to the structure and mode of growth of tumors, and other products of disease; and in 1842—1843, delivered courses of lectures on the diseases of bone, cartilage, and of the various changes which take place in inflammation of these and other important organs. The improvements in the construction of the compound microscope, about this period, furnished him with a most

Digitized by Google

valuable instrument for conducting his inquiries into the more recondite structural phenomena, which constitute the fundamental nature of the changes from a healthy to a diseased condition of tissues and organs. At the same time, he also investigated the minute structure of the healthy tissues, more especially with reference to the mode in which they performed their functions. He was one of the first observers who strongly insisted on the general diffusion, throughout the animal textures, of the minute bodies called *nuclei*; and he pointed out their importance in connection with the processes of growth, secretion, and nutrition. His Memoir on Secreting Structures, published in 1842, in the "Transactions of the Royal Society of Edinburgh," shewed, in a most conclusive manner, the influence exercised by the cells within a gland on the secretion formed in its interior. In the same year, he published a description of a case, in which a very remarkable vegetable organism, now known as the *Sarcina ventriculi* (see SARCINA) was periodically discharged in the fluid ejected from the stomach during vomiting. In the following year, he communicated to the Royal Society of Edinburgh an account of the structure of the Human Placenta, which is regarded as a most important contribution to the anatomy of that complex organ. Many of his physiological and pathological essays were afterwards incorporated in a special volume, published in 1845, and the facts which they contain have contributed very materially to establish the important modern pathological doctrine of the origin of morbid products from changes in the pre-existing elements of the tissues of the body.

His studies in comparative anatomy and natural history were not, however, neglected during this period. He was an active member of the Wernerian Society, and along with his friend Edward Forbes, communicated both to it and other scientific bodies several papers on the Anatomy of Animals, new to science, which they had discovered. His papers on Pelonaia, Thalassema, and Amphioxus attracted especial attention.

In 1844 he was appointed assistant to Dr Monro, Professor of Anatomy in the university of Edinburgh. His enthusiasm and devotion to anatomical work rapidly gathered around him a large class of students, and on the resignation of Dr Monro in 1846, he was appointed by the town council to the Chair of Anatomy. His reputation as an anatomical teacher now became materially extended, numerous students were attracted to his class, and for many years the attendance each winter session amounted to between 300 and 400. His great success as a teacher was due not so much perhaps to any special aptitude for public speaking, but to the earnest and painstaking way in which he brought his subject before his students; to his thorough knowledge of anatomy, not only in its minute details, but in its relations to physiological and pathological processes; and to the influence exercised by his manly and straightforward character. He devoted much of the time not occupied in the duties of his class to the extension of the Anatomical Museum of the university, and dissected and prepared a large number of specimens to illustrate the modifications, in form and structure, of the organs met with in the dissection of different kinds of animals. His preparations of the echinodermata, mollusca, and cetacea are especially worthy of notice.

He had a keen sense of the beauty and symmetry of organic forms, and his philosophic mind early led him to undertake an investigation into the constitution of the skeleton in the vertebrata, the general results of which he communicated, in the year 1856, to the British Association for the Advancement of Science.

His devotion to work, and his unremitting attention to the duties of his chair, at length began to tell on his robust frame; and for some years before his death, signs of failing health were visible. Early in 1867, he was obliged to withdraw from all active work; and he died at South Cottage, Wardie (near Edinburgh), March 6, in that year.

G.'s intellect was eminently comprehensive. He was not a mere technical anatomist, but studied his science in its relations to morphology, teleology, and pathology. In his philosophic grasp of principles, in the extent of his acquirements, and in his devotion to his science, he was a worthy disciple of his great compatriot, John Hunter. For a full account of his life, &c., see "Anatomical Memoirs of John Goodsir," published under the editorship of his successor in the chair of anatomy, Professor Turner (Longmans, 1868).

GOOD-WILL is rather a short popular expression than a legal term. It means

Digitized by Google

that kind of interest which is sold along with any profession, trade, or business. In reality, it is not the business that is sold, for that is not a distinct thing recognised by the law, but the house, shop, fixtures, &c., are sold, and the trade debts; and along with transferring these, the seller binds himself, either by covenant or agreement, to do everything in his power to recommend his successor, and promote his interests in such business. If the seller acts contrary to such agreement, he is liable to an action. But the more usual course is for the seller to enter into an express covenant not to carry on the same business within 30, 40, or 100 miles, or some specified moderate distance from the place where the purchaser resides. At first, such a covenant was sought to be set aside as invalid, on the ground that it tended to restrain the natural liberty of trade; but the courts have now firmly established that if a definite radius of moderate length is fixed upon, it does not sensibly restrain trade, inasmuch as the person covenanting can go beyond those limits, and trade as much as he pleases. Hence, such limitations are a fair matter of bargain, and upheld as valid. If the party break his covenant, he is liable to an action for damages.

GOODWIN SANDS, famous banks of shifting sands stretching about 10 miles, in a direction north-east and south-west, off the east coast of Kent, at an average distance of 5½ miles from the shore. The sands are divided into two portions by a narrow channel, and at low water, many parts are uncovered. When the tide recedes, the sand becomes firm and safe; but after the ebb, the water permeates through the mass, rendering the whole pulpy and treacherous, in which condition it shifts to such a degree as to render charts uncertain from year to year. The northern portion is of triangular form—3½ miles long, and 2½ in its greatest width; on the northernmost extremity, known as North Sand Head, a light-vessel marks the entrance on this perilous shoal. This light is distant about seven miles from Ramsgate. In the centre, on the western side, jutting out towards the shore, is the Blunt Head, a peculiarly dangerous portion, also marked by a light-ship. The southern portion is 10 miles in length, 2½ in width at its northern end, and sloping towards the south-west, to a point called South Sand Head, which, being marked by a light-vessel, completes the triangle of dangerous proximity recorded for the benefit of mariners.

From the sunken nature of these sands, they have always been replete with danger to vessels passing through the Strait of Dover, and resorting either to the Thames or to the North Sea. On the other hand, they serve as a breakwater to form a secure anchorage in the Downs (q. v.), when easterly or south-easterly winds are blowing. The Downs, though safe under these circumstances, become dangerous when the wind blows strongly off-shore, at which times ships are apt to drag their anchors, and to strand upon the perfidious breakers of the Goodwin, in the shifting sands of which their wrecks are soon entirely swallowed up. Many celebrated and terribly fatal wrecks have taken place here, among which we have only space to enumerate the three line-of-battle-ships, *Stirling Castle*, *Mary*, and *Northumberland*, each of 70 guns, which, with other ten men-of-war, were totally lost during the fearful gale of the 26th November, 1703, a gale so tremendous that vessels were actually destroyed by it while riding in the Medway. On the 21st December, 1805, here foundered the *Aurora*, a transport, when 300 perished; on the 17th December, 1814, the *British Queen*, an Ostend packet, was lost with all hands; and, on January 5, 1857, during a gale of eight days' duration, in which several other vessels were lost, the mail-steamer *Violet* was destroyed, involving the sacrifice of many lives in the catastrophe. From these dates it will be seen that the greatest dangers are to be apprehended in the winter months.

These dangerous sands are said to have consisted at one time of about 4000 acres of low land, fenced from the sea by a wall. One well known tradition ascribes their present state to the building of the Tenterden steeple, for the erection of which the funds that should have maintained the sea-wall had been diverted: this traditionary account is of little, if any value. Lambard, in writing of them, says: "Whatsoever old wives tell of Goodwyne, Earle of Kent, in time of Edward the Confessour, and his sandes, it appeareth by Hector Boëtius, the Brittish chronicler, that theise sandes weare mayne land, and some tyme of the possession of Earl Godwyne, and by a great inundation of the sea, they weare taken therfroe, at which tyme also much harme was done in Scotland and Flanders, by the same rage of the water." At the period of the Conquest by William of Normandy, these estates were taken from

Digitized by Google

Earl Godwin, and bestowed upon the abbey of St. Augustine at Canterbury, the abbot of which allowing the sea-wall to fall into a dilapidated condition, the waves rushed in, in the year 1100, and overwhelmed the whole. How far this account of the formation of this remarkable shoal can be relied on, is a matter of considerable doubt, the documentary evidence on the subject being scanty and unsatisfactory. A colorable confirmation is, however, to be deduced from the fact of the successive inroads which the sea has made for centuries past, and is still making along the whole east coast of England.

As a precaution, now, in foggy weather, bells in the light-ships are frequently sounded. Difficulty is experienced in finding firm anchorage for these vessels; and all efforts to establish a fixed beacon have been hitherto unsuccessful. In 1846, a light-house on piles of iron screwed into the sand was erected, but it was washed away in the following year. As soon as a vessel is known to have been driven upon the sands, rockets are thrown up from the light-vessels, and the fact thus communicated to the shore. The rockets are no sooner recognised than a number of boatmen, known all along the coast as "hovellers," immediately launch their boats and make for the sands, whatever may be the state of wind and weather. These "hovellers" regard the wreck itself as their own property, and although during fine weather they lead a somewhat regardless as well as a wholly idle and inactive life, their intrepidity in seasons of tempest is worthy of all praise.

GOODYEAR, Charles, American inventor, was born at New Haven, Connecticut, December 29, 1800, the son of an iron-manufacturer, with whom, at the age of 21, he went into business in Philadelphia. Failing in the iron trade, his attention was attracted to the manufacture of india-rubber, and he expended all his means, and reduced his family to utter destitution, in experiments with various mixtures and processes, the most successful of which were with magnesia, lime, and nitric acid to make it available for waterproof shoes, clothing, &c. His efforts were a series of failures, excepting a partial success in treating the surface of rubber goods with nitric acid, until he bought of one Hayward, a rival experimenter, an invention for mixing india-rubber with sulphur. The great secret of vulcanisation, in which the two substances, submitted to a high temperature, are converted into the elastic, enduring, and heat and cold defying fabrics now in use, was an accidental discovery made while standing by a stove, and idly subjecting a mixture of rubber and sulphur to its heat. This new product he patiently perfected, discovering new uses to which it could be applied, until it required sixty patents to secure his inventions. Some of these rights were secured by other persons in England, and in France they were forfeited by an informality; so that, by these means, and from expensive law-suits, he gathered little from ten years of toil and privations save the honors awarded to his skill and perseverance in giving to the world a staple now applied in different countries to 500 uses, and employing 60,000 workmen in its manufacture. He died in 1860.

GOOLAI'REE or Gomu'l Pass, an important pass in the north-west of India, across the Suliman range from the Derajat into Cabul. It enters the mountains at their eastern base, in lat. 32° 6′ n., and long. 70° e. It holds its course, which is very winding, by broken rugged roads, or rather the watercourses of the Gomul, through the wild and mountainous country of the Muzarees. It is of great importance, being the middle route from Hindustan to Afghanistan, as the Khyber is the northern, and the Bolan the southern. Immense caravans, consisting principally of Lohani Afghans, every spring traverse it westward from the Indus and the adjacent countries, and returning in the autumn, winter in the Derajat. It is much infested by freebooters of the Vaziri Afghan tribe, and the caravans have often to fight their way with much loss of life and property.

GOOLE, a thriving market-town and river-port of England, in the West Riding of Yorkshire, is situated on the right bank of the Ouse at its junction with the Dutch River, 22 miles south-south-east of York. It has only recently risen into importance, and may be said to date the commencement of its prosperity from its establishment as a bonding-port in 1829. It has commodious ship, barge, and steam-vessel docks, a patent slip for repairing vessels, ponds for bonded timber, a neatly-built custom-house, and extensive warehouse accommodation. G. has a considerable trade in ship and boat building, sail-making, iron-founding, and agricultural machine-making; it has also several corn-mills, some of which are worked

Digitized by Google

by steam. Coal is largely exported along the coast, and in considerable quantities to London. In 1875, 3336 vessels, of 550,052 tons, entered and cleared the port. Pop. (1871) 7680.

GOOSANDER (*Mergus Merganser*), a web-footed bird of the same genus with those commonly called Mergansers (q. v.), and the largest of the British species. It is larger than a wild duck; the adult male has the head and upper part of the neck of a rich shining green; the feathers of the crown and back of the head elongated, the back black and gray, the wings black and white, the breast and belly of a delicate reddish buff color. The female has the head reddish brown, with a less decided tuft than the male, and much grayer plumage, and has been often described as a different species, receiving the English name of *Dundiver*. Both mandibles are furnished with many sharp serratures or teeth directed backwards, the nearest approach to true teeth to be found in the mouth of any bird. See also BILL. The G. is a native of the arctic regions, extending into the temperate parts of Europe, Asia, and America; in the southern parts of Britain, it is seen only in winter, and then only in severe weather, the females and young migrating southwards in such circumstances more frequently than the old males, and not unfrequently appearing in small flocks in the South of Scotland and north of England; but in some of the northern parts of Scotland and the Scottish isles it spends the whole year. It feeds on fish, crustaceans, and other aquatic animals which its serrated bill and its power of diving admirably adapt it for seizing. The flesh of the G. is extremely rank and coarse, but the eggs appear to be sought after by the inhabitants of some northern countries.

GOOSE (*Anser*), a genus of web-footed birds, one of the sections of the Linnæan genus *Anas* (q. v.), having the bill not longer than the head, more high than broad at the base, the upper mandible slightly hooked at the tip; the legs placed further forward than in ducks, and so better adapted for walking; the neck of moderate length, with sixteen vertebræ, a character which widely distinguishes them from swans. In general, geese spend more of their time on land than any other of the *Anatidæ*, feeding on grass and other herbage, berries, seeds, and other vegetable food. Although large birds, and of bulky form, they have great powers of flight. They strike with their wings in fighting, and there is a hard callous knob or tubercle at the bend of the wing, which in some species becomes a spur. The DOMESTIC G. is regarded as deriving its origin from the GRAY LAG G. or COMMON WILD G. (*A. ferus*); but all the species seem very capable of domestication, and several of them have been to some extent domesticated. The Gray Lag G. is almost three feet in length from the tip of the bill to the extremity of the short tail. Its extent of wing is about five feet. The wings do not reach to the extremity of the tail. The weight of the largest birds is about ten pounds. The color of the plumage is gray, varying in some parts to grayish brown; the rump and belly white, the tail grayish brown and white; the bill is orange, the *nail* at the tip of the upper mandible white. The young are darker than the adults. The Gray Lag G. is common in some parts of the centre and south of Europe, also in many parts of Asia, and in the north of Africa, but it is not known in America. It is a bird of temperate rather than of cold climates. In some countries, it is found at all seasons of the year, but it deserts its most northern haunts in severe weather, migrating southward; its flocks, like those of others of this genus, flying at a great height, beyond the reach of shot, except of the rifle, one bird always leading the flock, the rest sometimes following in a single line, but more generally in two lines converging to the leading bird. The Gray Lag G. was formerly abundant in the fenny parts of England, and resided there all the year, but the drainage of the fens has made it now a rare bird, and only known as a winter visitant in the British Islands. It frequents bays of the sea and estuaries as well as inland waters, and often leaves the waters to visit moors, meadows, and cultivated fields, generally preferring an open country, or taking its place, as remote as possible from danger, in the middle of a field. These excursions are often made by night, and no small mischief is often done by a flock of hungry geese to a field of newly-sprung wheat or other crop. At the breeding-season, the winter-flocks of wild geese break up into pairs; the nests are made in moors or on tussocks in marshes; the eggs vary in number from five to eight or rarely twelve or fourteen; they are of a dull white color, fully three inches long, and two inches in diameter.

Digitized by Google

Although the common G. has been long domesticated, and it was probably among the very first of domesticated birds, the varieties do not differ widely from each other. *Emden Geese* are remarkable for their perfect whiteness; *Toulouse Geese*, for their large size. As a domesticated bird, the G. is of great value, both for the table, and on account of its quills, and of the fine soft feathers. The quills supplied all Europe with pens before steel pens were invented, and have not ceased to be in great demand. Geese must have free access to water, and when this is the case, they are easily reared, and rendered profitable. Two broods are sometimes produced in a season, ten or eleven in a brood, and the young geese are ready for the table in three months after they leave the shell. They live, if permitted, to a great age. Willughby records an instance of one that reached the age of eighty years, and was killed at last for its mischievousness. Great flocks of geese are kept in some places in England, particularly in Lincolnshire and regularly plucked five times a year, for feathers and quills. Geese intended for the table are commonly shut up for a few weeks, and fattened before being killed. Great numbers are imported from Holland and Germany for the London market, and fattened in England in establishments entirely devoted to this purpose. *Goose-hams* are an esteemed delicacy. The gizzards, heads, and legs of geese are also sold in sets, under the name of *giblets*, to be used for pies. The livers of geese have long been in request among epicures; but the *pâte de foie d'oie* or *pâté de foie gras* of Strasburg, is made from livers in a state of morbid enlargement, caused by keeping the geese in an apartment of very high temperature. Large goose-livers were a favorite delicacy of the ancient Roman epicures.

The Gray Lag G. is the largest of the native British species. The next to it in size, and by far the most abundant British wild goose, is the BEAN G. (*A. segetum*), a very similar bird; the bill longer, orange, with the base and nail black; the plumage mostly gray, but browner than in the Gray Lag G., the rump dark brown. The wings extend beyond the tail. The habits scarcely differ from the Gray Lag G., but the Bean G. is a more northern species. It is common in all the northern parts of Europe and Asia; and great numbers breed in Nova Zembla, Greenland, and other most northern regions. Large flocks are to be seen in many parts of Britain in winter, particularly during severe frosts, but a few also breed in the north of Scotland, and even in the north of England. The Bean G. is easily domesticated, but generally keeps apart from the ordinary tame geese.—The WHITE-FRONTED G., or LAUGHING G. (*A. albifrons*), is a frequent winter visitant of Britain; a native of Europe, Asia, and America, breeding chiefly on the coasts and islands of the arctic seas. It is only about 27 inches in its utmost length. The plumage is mostly gray; there is a conspicuous white space on the forehead. It has been often tamed.—Similar to it in size is the PINK-FOOTED G. (*A. brachyrhynchus*), a species which has a very short bill. In England it is rare, and a mere winter visitor, but it breeds in great numbers in some of the Hebrides.—The SNOW G. (*A. hyperboreus*) is found in all the regions within the arctic circle, but most abundantly in America, where it migrates southward in winter, as far as the Gulf of Mexico. It is somewhat smaller than the Bean Goose. The general color of the plumage is pure white, the quill feathers brownish black. The feathers imported from the Hudson's Bay territories are in great part the produce of this beautiful species, and probably many of the fine white goose feathers imported from Russia. Its flesh is greatly esteemed. —The CANADA G. (*A. Canadensis*) is one of the most abundant North American species, breeding even in the milder latitudes, but in vast numbers in the more northern parts, from which it migrates southwards on the approach of winter. It was introduced into Britain at least 200 years ago, and many now be regarded as fully naturalised; a great ornament of lakes and artificial ponds, from which it makes excursions in small flocks over the surrounding districts. In the uniform breadth of the bill it resembles swans. It is fully three feet and a half from the tip of the bill to the extremity of the tail; but its neck is long and slender, and it does not exceed the common G. in weight so much as in length. The bill, the feet, the head, great part of the neck, the quill-feathers, the rump, and the tail are black; there is a crescent-shaped white patch on the throat, whence this species has received the name of the CRAVAT G.; the back, wings, and flanks are grayish brown, the breast and belly pure white. The Canada G. has a peculiar resounding hoarse cry. It is easily reduced to the most complete domestication. Its flesh affords great part of the

Digitized by Google

winter supplies of the Hudson's Bay residents, and is much used in a salted state.—The CHINA G., or GUINEA G. (*A. Guinensis* or *cynoides*), of which the native country is supposed to be Guinea, has long been known in Britain in a state of domestication. It has an elevated knob at the base of the upper mandible, which has obtained it the name of Knobbed Goose.—Other species of geese are noticed in the articles BARNACLE GOOSE and CHENOPSIS; and species closely allied to those noticed in this article are found in India and other parts of the world.

GOOSEBERRY (*Grossularia*), a sub-genus of the genus *Ribes* (see CURRANT), distinguished by a thorny stem, a more or less bell-shaped calyx and flowers on 1—4-flowered stalks.—The common G. (*Ribes Grossularia*) is a native of many parts of Europe and the north of Asia, growing wild in rocky situations and in thickets, particularly in mountainous districts; but it is a doubtful native of Britain, although now to be seen in hedges and thickets almost everywhere. Some botanists have distinguished as species the variety having the berries covered with gland-bearing hairs (*setæ*); that having the germens covered with soft unglandular hairs, and the berries ultimately smooth and that which has even the germens smooth (*R. Grossularia, R. uva-crispa*, and *R. reclinatum*); but these varieties seem to have no definite limits in nature. The varieties produced by cultivation are very numerous, chiefly in England, where, and particularly in Lancashire, greater attention is paid to the cultivation of this valuable fruit-shrub than in any other part of the world. In the south of Europe, it is little known. It does not appear to have been known to the ancients. Its cultivation cannot be certainly referred to an earlier date than the 17th c., and was only in its infancy at the middle of the 18th, when the largest gooseberries produced in Lancashire scarcely weighed more than 10 dwts., whereas the prize-gooseberries of that county now sometimes exceed 30 dwts. Many well-known diversities of form, color, and flavor, as well as of size, mark the different varieties. For the production of new varieties, the G. is propagated by seed; otherwise, generally by cuttings, which grow very freely. Any good garden soil suits the gooseberry. It is rather the better of a little shade, but suffers from much. The bushes are trained in various ways, but it is necessary to prune so that they may not be choked up with shoots, whilst care ought to be taken to have an abundant supply of young wood, which produces the largest berries. Besides its well-known wholesomeness and pleasantness, and its use for making an excellent preserve and jelly, the ripe fruit is used for making wine and vinegar. An effervescent gooseberry wine, which might well claim attention under its own name, is often fraudulently sold as champagne. The use of unripe gooseberries for tarts increases the value of this fruit-shrub. The G. season is prolonged by training plants on north walls, and by covering the bushes with matting when the fruit is about ripe. Unripe gooseberries are kept in jars or bottles, closely sealed, and placed in a cool cellar, to be used for tarts in winter. When the bottles are filled, they are heated, by means of boiling water or otherwise, to expel as much air as possible before they are corked and sealed. Various derivations have been given of the name G., but most probably the first syllable is a corruption of *groseille*, the French name of the fruit, from which also comes the Scotch *grozet* or *grozart*. In some parts of England, the G. is called *feaberry*.—among the other species of G. most worthy of notice are *R. cynosbati*, a native of Canada, of Japan, and of the mountains of India, much resembling the common G. in foliage and habit, the fruit more acid than the cultivated G.; *R. divaricatum*, a native of the north-west coast of America, with smooth, black, globose, acid fruit; *R. irriguum*, also from the north-west coast of America, with well-flavored globose fruit, half an inch in diameter; *R. oxyacanthoides*, a native of Canada, with small globose, red, green, or purplish berries of an agreeable taste; *R. gracile*, found in mountain-meadows from New York to Virginia, with blue or purplish berries of exquisite flavor; *R. aciculare*, a Siberian species, with sweet, well-flavored yellowish or purplish smooth berries; all of which, and probably others, seem to deserve more attention than they have yet received from horticulturists.—The SNOWY-FLOWERED G. (*R. niveum*), a native of the north-west coast of America, is remarkable for its beautiful white pendulous flowers. Its berries in size and color resemble black currants, are acid, with a very agreeable flavor, and make delicious tarts. Another species from the same region (*R. speciosum*) is very ornamental in pleasure-grounds, and is remarkable for its shining leaves, its

Digitized by Google

flowers with four stamens—the other species having five—and the great length of the filaments.—*R. saxatile*, a native of Siberia, and other species, forming a subgenus called *Botrycarpum*, have a character somewhat intermediate between currants and gooseberries, being prickly shrubs, but having their flowers in racemes. *R. saxatile* has small, smooth, globose, dark purple berries, like currants, which are very agreeable.

GOOSEBERRY, Coromandel. See CARAMBOLA.

GOOSEBERRY, Peruvian. See PHYSALIS.

GOOSEBERRY CATERPILLAR, the larva of *Abraxas grossulariata*, a moth of a whitish color, with yellow streaks, and spotted with black. The larva is beautifully colored, with black and white stripes, and in its progression, forms an elevated loop with its body. It feeds on the foliage of the gooseberry and currant.—Another moth, of which the caterpillar also feeds on the leaves of these shrubs, is *Halias Vanaria*. Both the moth and the caterpillar are smaller than the former. But more destructive than either of these is the larva of a saw-fly, *Nematus ribesii*, which deposits its eggs along the ribs on the under surface of the leaves; the larva is green and "shagreened" with minute black tubercles. Many remedies have been proposed and tried to prevent the ravages of these larvæ, of which, perhaps, the best are picking off the leaves observed to be covered with the eggs of the saw-fly, and dusting with powder of white hellebore, which, if carefully and sufficiently applied, is most efficacious, killing any kind of larva.

GOPHER WOOD. The probable identity of the gopher wood of Scripture with the Cypress (q. v.), is maintained partly on account of the qualities of the wood, and partly on account of the agreement of the radical consonants of the names.

GÖPPINGEN, a small town of the kingdom of Würtemberg, is situated on the right bank of the Fils, 27 miles north-west from Ulm, and is a station on the railway from Ulm to Stuttgart. It is an industrious, cleanly, and flourishing town, possessing a town-hall, a large castle, and mineral baths, and carrying on manufactures of woollen cloth, earthenwares, and some trade in wool. Pop. (1875) 9532.

GORAL (*Antilope Goral*, or *Nemorhedus Goral*), an animal of the antelope family, inhabiting in large herds the elevated plains of Nepaul. It is of a grayish-brown color, dotted with black, the cheeks white; the hair is short; the horns are short, inclined, recurved, and pointed. It is a wild and fleet animal, and when pursued, takes refuge in rocky heights. Its flesh is highly esteemed.

GORAMY, or Gourami (*Osphromenus olfax*), a fish of the family *Anabasidæ* or *Labyrinthibranchidæ*, a native of China and the Eastern Archipelago, highly esteemed for the table, and which has on that account been introduced into Mauritius, Cayenne, and the French West India Islands. Its form is deep in proportion to its length, the head small, and terminating in a rather sharp short snout, the mouth small, the tail rounded, the dorsal and anal fins having numerous rather short spines, the first ray of the ventral fins extending into a very long filament. It is sometimes kept in large jars by the Dutch residents in Java, and fed on water plants. It was introduced into Mauritius about the middle of the 18th c., and soon spread from the tanks in which it was at first kept into the streams, multiplying abundantly. The success which has attended the introduction of this fish into countries remote from those in which it is indigenous, holds out great encouragement to other attempts of the same kind. The G. is interesting also on other accounts. It is one of the nest-building fishes, and at the breeding season forms its nest by entangling the stems and leaves of aquatic grasses. Both the male and female watch the nest for a month or more with careful vigilance, and violently drive away every other fish which approaches, till the spawn is hatched, afterwards affording a similar parental protection to the young fry.

GORDIAN-KNOT. The traditional origin of this famous knot was as follows: Gordius, a Phrygian peasant, was once ploughing in his fields, when an eagle settled on his yoke of oxen, and remained till the labor of the day was over. Surprised at so wonderful a phenomenon, he sought an explanation of it, and was informed by a prophetess of Telmissus that he should offer sacrifice to Zeus. He did so, and out of gratitude for the kindness shewn him, married the prophetess, by whom he

Digitized by Google

had a son, the famous Midas. When Midas grew up, disturbances broke out in Phrygia, and the people sent messengers to the oracle at Delphi, to ask about choosing a new king. The messengers were informed that a king would come to them riding on a car, and that he would restore peace. Returning to Phrygia, they announced these things, and while the people were talking about them, Gordius, with his father, very opportunely arrived in the requisite manner. He was immediately elected king, whereupon he dedicated his car and yoke to Zeus, in the acropolis of Gordium (a city named after himself), the knot of the yoke being tied in so skilful a manner, that an oracle declared whoever should unloose it would be ruler of all Asia. When Alexander the Great came to Gordium, he cut the knot in two with his sword, and applied the prophecy to himself.

GORDIA'NUS, the name of three Roman emperors, father, son, and grandson.—The first, MARCUS ANTONIUS G., was grandson of Annius Severus, and was descended by the father's side from the famous family of the Gracchi. He was remarkable for his attachment to literary pursuits. After being sedile, in which capacity he celebrated the gladiatorial sports with great magnificence, he twice filled the office of consul, first as the colleague of Caracalla, in 213 A.D.; and second, as the colleague of Alexander Severus. Soon afterwards, he was appointed proconsul of Africa, where he gained the affections and esteem of the people by his modest and gentle manners, his splendid liberality, and his refined literary taste; his old age was spent in the study of Plato, Aristotle, Cicero, and Virgil. The tyranny and injustice of the Emperor Maximinus having at length excited a rebellion against his authority in Africa, the imperial procurator there was murdered by a band of nobles who had formed a conspiracy against him on account of his cruelty. G., now in his 80th year, was proclaimed emperor, after having vainly refused the dangerous honor. He received the title of *Africanus*, and his son was conjoined with him in the exercise of imperial authority. The Roman senate acknowledged both, and proclaimed Maximinus, then absent in Pannonia, an enemy to his country. The younger G., however, was defeated in battle by Capellianus, viceroy of Mauritania, before Carthage, and his father, in an agony of grief, put a period to his own existence, having been emperor for little more than a month. In his personal appearance, G. is said to have greatly resembled Augustus.—MARCUS ANTONIUS G., grandson of the preceding, was raised to the dignity of Cæsar along with Pupienus, Maximus, and Balbinus, who were also elected emperors in opposition to Maximinus; and, in the same year, after all three had fallen by the hands of their own soldiers, Marcus Antonius was elevated by the Prætorian bands to the rank of Augustus. Assisted by his father-in-law, Misitheus, a man distinguished for his wisdom, virtue, and courage, whom he made prefect of the Prætorians, he marched, in the year 242, into Asia, against the Persians, who, under Shahpûr (Sapor), had taken possession of Mesopotamia, and had advanced into Syria. Antioch, which was threatened by them, was relieved by G., the Persians were obliged to withdraw from Syria beyond the Euphrates, and G. was just about to march into their country, when Misitheus died. Philip the Arabian, who succeeded Misitheus, stirred up dissatisfaction in the army against G. by the falsest treachery, and finally goaded on the ignorant and passionate soldiery to assassinate the emperor, 244 A.D. But knowing the great affection which the Roman people had for the gallant and amiable G., he declared in his dispatch to the senate that the latter had died a natural death, and that he himself had been unanimously chosen to succeed him.

GO'RDIUS, a genus of *Annelida*, of the very simplest structure; very much elongated and threadlike, with no greater marks of articulation than slight transverse folds, no feet, no gills, no tentacles, although there is a knotted nervous chord. The mouth is a mere pore at one end of the animal; the other end or tail is slightly bifid, and has been often mistaken for the head. The species inhabit moist situations, are sometimes found on the leaves of plants, but more frequently in stagnant pools, and in mud or soft clay, through which they work their way with great ease. They often twist themselves into complex knots, whence their name G., from the celebrated *Gordian-knot*—and many of them are sometimes found thus twisted together; but they are also often to be found extended in the water. The most common species in Britain is *G. aquaticus*, of which the popular name is HAIR EEL; and a notion still prevails in many parts of the country, that it is nothing else

Digitized by Google

than a horse-hair, which has somehow acquired life by long immersion in water, and which is destined in due course of time to become an eel of the ordinary kind and dimensions; in proof of all which many an honest observer is ready to present himself as an eye-witness who has often seen these very slender eels in his walks. A popular notion prevails in Sweden, that the bite of the G. causes whitlow. When the pools in which the G. lives are dried up, it becomes shrivelled, and apparently lifeless, but revives on the application of moisture. The Abbé Fontana kept one in a drawer for three years, and although perfectly dry and hard, it soon recovered vigor on being put into water. Gordii are extremely common in the Thames.

GORDON, The Family of. The origin of this great Scottish historical house is still wrapped in some measure of obscurity. Uncritical genealogists of the 17th c. affected to trace its descent from a mythical High Constable of Charlemagne, a Duke of Gordon, who, it was said, flourished about the year 800, and drew his lineage from the Gordoni, a tribe which, taking its name from the town of Gordunia, in Macedonia, had settled in Gaul before the days of Julius Cæsar. These fables and fancies have long ceased to be believed. Nor is more credit given to the conjecture that the family, having carried its name from Normandy to England in the train of the Conqueror, soon afterwards passed on from England to Scotland. No proof has been found of any connection between the Gordons of France and the Gordons of Scotland. There is little or no doubt now that the Scottish Gordons took their name from the lands of Gordon in Berwickshire. Their earliest historian, writing in the 16th c., says that these lands, together with the arms of three boars' heads, were given by King Malcolm Ceanmohr (1057—1093 A. D.) to the progenitor of the house, as a reward for slaying, in the forest of Huntly, a wild boar, the terror of all the Merse. But in the 11th c., there were neither heraldic bearings in Scotland nor Gordons in Berwickshire. The first trace of the family is about the end of the 12th c., or the beginning of the 13th c., when it appears in record as witnessing charters by the great Earls of March or Dunbar, and as granting patches of land and rights of pasturage to the monks of Kelso. About a century afterwards, it enters the page of history in the person of Sir Adam of Gordon. He is found, in 1305, high in the confidence of King Edward I. of England, holding under that prince the office of joint justiciar of Lothian, and sitting in the English council at Westminster as one of the representatives of Scotland. He seems to have been among the last to join the banner of Bruce, who rewarded his adherence, tardy as it was, by a grant of the northern lordship of Strathbogie. The grant failed of effect at the time; but it was renewed by King David II. in 1357, and by King Robert II. in 1376. Under this last renewal, Sir John of Gordon, the great-grandson of Sir Adam, entered into possession, and so transferred the chief seat and power of the family from the Merse and Teviotdale to the banks of the Dee, the Deveron, and the Spey. Its direct male line came to an end in his son Sir Adam, who fell at Homildon in 1402, leaving an only child, a daughter, to inherit his lands, but transmitting his name through two illegitimate brothers—John of Gordon of Scurdargue, and Thomas of Gordon of Ruthven—to a wide circle of the gentry of Mar, Buchan, and Strathbogie, who, calling themselves "Gordons," styled the descendants of their niece "Seton-Gordons."

LORDS OF GORDON AND BADENOCH, EARLS OF HUNTLY, MARQUISES OF HUNTLY, AND DUKES OF GORDON.—Elizabeth of Gordon, the heiress of Sir Adam, married before 1408 Alexander of Seton (the son of Sir William of Seton), who, before 1437, was created Lord of Gordon. Their son Alexander, who took the name of Gordon, was made Earl of Huntly in 1445, and Lord of Badenoch a few years afterwards. He acquired by marriage the baronies of Cluny, Aboyne, and Glenmuick in Aberdeenshire; and had grants from the crown of the Highland lordship of Badenoch, and of other lands in the counties of Inverness and Moray. He died in 1470, and was succeeded by his second son George, the second earl, who married Annabella, daughter of King James I., and added to the territories of his house the lands of Schivas in Aberdeenshire, and the Boyne, the Enzie, and Netherdale in Banffshire. He was chancellor of Scotland from 1498 to 1502, and dying soon afterwards, was succeeded by his son Alexander, the third earl, who enlarged the family domains by the acquisition of Strathaven (or Strathdoun) in Banffshire, and of the Brae of Lochaber in Inverness-shire. He commanded the left wing of the Scottish army at Flodden; and, escaping the carnage of that disastrous field, survived till the year 1524. He was succeeded by his grandson George, the fourth

Digitized by Google

earl, under whom the family reached, perhaps, its highest pitch of power. He added the earldom of Moray to its already vast possessions, and long held the great offices of lieutenant of the north and chancellor of the realm. He had the repute of being the wisest, the wealthiest, and the most powerful subject in Scotland. The crown, it is said, was counselled to clip his wings, lest he should attempt, like the Douglases in the previous age, to awe or overshadow the throne. He was stripped of the earldom of Moray, and rushing into revolt, was routed and slain at Corrichie in 1562. Sentence of forfeiture was pronounced upon his corpse, but it was rescinded in 1567, and his son George succeeded as fifth earl. He died in 1576. The family had stood aloof from the Reformation, and his son and successor, George, the sixth earl, was conspicuous as the head of the Roman Catholic power in Scotland. He defeated a Protestant army sent against him under the Earl of Argyle in 1594, but submitting to the king, obtained an easy pardon and was made Marquis of Huntly in 1599. He died in 1636, leaving a character of which we have an instructive sketch by a neighbor and contemporary. "This mighty marquis," says the northern annalist, John Spalding, "was of a great spirit, for in time of troubles he was of invincible courage, and boldly bore down all his enemies triumphantly. He was never inclined to war nor trouble himself; but by the pride and insolence of his kin, was diverse times drawn in trouble, which he bore through valiantly. He loved not to be in the laws contending against any man, but loved rest and quietness with all his heart; and in time of peace, he lived moderately and temperately in his diet, and fully set to building and planting of all curious devices. A well set neighbor in his marches, disposed rather to give nor take a foot of ground wrongously. He was heard say he never drew sword in his own quarrel. In his youth, a prodigal spender; in his elder age, more wise and worldly, yet never counted for cost in matters of credit and honor; a great householder; a terror to his enemies, whom, with his prideful kin, he ever held under great fear, subjection and obedience. He was mightily envied by the kirk for his religion, and by others for his greatness, and had thereby much trouble." We mark a new social stage when we are told that he was the first head of his house who "bought" land. His son George, the second marquis, distinguished himself by the zeal with which he espoused the royal cause in the great civil war of his time. "You may take my head from my shoulders," he said, in answer to tempting offers from the Covenanters, "but not my heart from the king." Such was the state he kept, that when he took up house in Aberdeen in 1639, he was attended daily by 24 gentlemen, of whom three were of the rank of barons, while eight gentlemen were charged with the watch of his mansion by night. He was beheaded at Edinburgh in 1649, and was succeeded by his son Lewis, the third marquis, who died in 1653. The family possessions had been impaired by war and forfeiture, but it appears that they still sufficed, in 1667, to yield £24,771 Scots a year to his son George, the fourth marquis, who was made Duke of Gordon in 1684. He held out the castle of Edinburgh for King James at the Revolution; and dying in 1716, was succeeded by his son Alexander, the second duke, who died in 1728. He was the last Roman Catholic chief of his race, and, as we are told by Boswell, lived "in sequestered magnificence, corresponding with the grand dukes of Tuscany," with whom he believed that he could count kindred. He never travelled in the north without a train of his vassals on horseback. His son, Cosmo George, the third duke, died in 1752, leaving three sons. The youngest, Lord George Gordon, led the Protestant mob which sacked London in 1780; the eldest, Alexander, the fourth duke, died in 1827, being succeeded by his son George, the fifth duke, on whose death, without issue in 1836, the title of Duke of Gordon (being limited to the heirs-male of the body of the first duke) became extinct, the title of Earl of Huntly fell into abeyance, and the title of Marquis of Huntly was adjudged to the Earl of Aboyne, as heir-male of the body of the first marquis. The estates went to the duke's nephew, Charles, fifth Duke of Richmond and Lennox, grandson of the fourth duke of Gordon, and his wife, the sprightly Jane Maxwell, daughter of Sir William Maxwell, of Monreith. The title of Duke of Gordon was revived in 1876, in the person of the sixth Duke of Richmond.

VISCOUNT OF MELGUND, VISCOUNTS OF ABOYNE, EARLS OF ABOYNE, and MARQUISES OF HUNTLY.—Lord John Gordon, second son of the first Marquis of Huntly, was made Viscount of Melgund and Lord Aboyne in 1627. Three years afterwards he was burned to death in the tower of Frendraught. In 1632, his elder brother, George,

Digitized by Google

was made Viscount of Aboyne, and on his succession to the Marquisate of Huntly in 1636, the title of Viscount of Aboyne devolved on his third son, who distinguished himself on the king's side during the wars of the Covenant, and died, it is said, of a broken heart, a few days after the execution of Charles I., in 1649. Lord Charles Gordon, third son of the second Marquis of Huntly, was made Earl of Aboyne in 1660. His great-great-grandson, George, who had been a favorite at the court of Marie Antoinette, succeeded as fifth Earl of Aboyne in 1794, on the death of his father, and as eighth Marquis of Huntly in 1836, on the death of the fifth Duke of Gordon.

EARLS OF SUTHERLAND.—About the year 1512, Adam Gordon of Aboyne, second son of the second Earl of Huntly, married Elizabeth, the heiress of Sutherland, and in her right became Earl of Sutherland. Neither he nor his wife, it appears, could write their own names. Their descendants, the Earls of Sutherland, continued to bear the surname of Gordon through six or seven generations, till the beginning of the 18th c., when they exchanged it for the surname of Sutherland, which had been borne by the Countess Elizabeth before her marriage with Adam Gordon.

LORDS OF LOCHINVAR AND VISCOUNTS OF KENMURE.—William of Gordon, the second son of Sir Adam of Gordon, who figured in the reign of King Robert I. (1306—1329), had a grant from his father of the barony of Stitchel, in Teviotdale, and of the lands of Glenkens, in Galloway. He was the progenitor of the knightly family of Lochinvar, which in 1633 was raised to the peerage by the titles of Lord of Lochinvar and Viscount of Kenmure. William, the sixth viscount—the "Kenmure's on and awa'" of Jacobite song—was beheaded in 1716 for his share in the rising of the previous year. The peerage, which was then forfeited, was restored in 1824, but has been in abeyance since the death of Adam, the ninth viscount, in 1847.

EARLS OF ABERDEEN.—Some genealogists have sought to ingraft this branch upon the parent stem before it was transplanted to the north towards the end of the 14th century. But no evidence has been produced in support of this claim; and modern research holds by the old tradition, that the house descends from one of the illegitimate brothers of Sir Adam of Gordon, who was slain at Homildon in 1402. Its first possession seems to have been Methlic on the banks of the Ythan. Patrick Gordon of Methlic fell under the banner of the Earl of Huntly at the battle of Arbroath in 1445. His son and successor was of sufficient mark to obtain the bishopric of Aberdeen for one of his younger sons in 1516. The family reached the rank of lesser baron in 1581, and the dignity of knight-baronet in 1642. Its chief, at this last date—Sir John Gordon of Haddo—one of the most gallant of the northern cavaliers, was the proto-martyr of his party, the first of the royalists who suffered death by a judicial sentence. He was beheaded at the cross of Edinburgh by the Covenanters in 1644, bequeathing the name of "Haddo's Hole" to one of the aisles of St Giles's Church, which had been his prison. His son, Sir George Gordon of Haddo, after distinguishing himself at the university and the bar, was made a Lord of Session in 1680, Lord President of the court in 1681, and Lord Chancellor in the following year. He was raised to the peerage in 1682, by the titles of Earl of Aberdeen, Viscount of Formartine, Lord Haddo, Methlic, Tarves, and Kellie. He died in 1720, with the character of being "a solid statesman, a fine orator, speaking slow but strong." Some of these lineaments, it has been thought, reappeared, with his love of letters, in his great-great-grandson, George, fourth Earl of Aberdeen, who died in 1860, after holding the office of Prime Minister of the United Kingdom from December 1852 to February 1855.

The history of the Gordons was written in the middle of the 16th c., at the request of the fourth Earl of Huntly, by an Italian monk, who found his way to the Cistercian monastery of Kinloss, in Moray. His work, which has not yet been printed, is entitled, "Historiæ Compendium de Origine et Incremento Gordoniæ Familiæ, Johanne Ferrerio, Pedemontano, authore, apud Kinlos A.D. 1545, fideliter collectum." A century later, the Gordons found another and abler historian in a country gentleman of their own race, the excellent and accomplished Robert Gordon of Straloch, who died in 1661, before he had completed his "Origo et Progressus Familiæ Illustrissimæ Gordoniorum in Scotia." It is still in manuscript. A "History of the Ancient, Noble, and Illustrious Family of Gordon," by William Gordon, of Old Aberdeen, was published at Edinburgh in 1726—1727, in 2 vols. 8vo. "A Concise

Digitized by Google

History of the Antient and Illustrious House of Gordon," by C. A. Gordon, appeared at Aberdeen, in 1 vol. 12mo, in 1754. The chief value of both books is now in their rarity. A work of much greater merit is the "Genealogical History of the Earldom of Sutherland," or, as its author called it, "The Genealogie and Pedigree of the most Ancient and Noble Familie of the Earles of Southerland, wherein also many Particulars are related touching the Surname of Gordoun and the Family of Huntley." This was published at Edinburgh in 1813, in 1 vol. fol. It was written in 1639, by Sir Robert Gordon of Gordonstoun, the fourth son of the twelfth Earl of Sutherland by his marriage with that Lady Jane Gordon (daughter of the fourth Earl of Huntly), who was divorced from the infamous Earl Bothwell, in order that he might marry Mary Queen of Scots. Along with Sir Robert Gordon's work, there is printed a continuation of it to the year 1651, by Gilbert Gordon of Sallach. We learn from this sequel that the House of Gordon of Gight (claiming descent from a younger son of the second Earl of Huntly), which gave birth, at the end of the 18th c., to the poet George Gordon, Lord Byron, gave birth, at the end of the 16th c., to one of the assassins of Wallenstein, Colonel John Gordon, governor of Eger, in Bohemia.

GORDON, General Patrick, one of the most distinguished of the many soldiers of fortune whom Scotland sent to the wars of Europe, was born at Easter Auchleuchries, a bleak homestead on the eastern coast of Aberdeenshire, on the 31st of March 1635. His father, a "goodman" or yeoman, was a grandson of the family of Gordon of Haddo, afterwards raised to the earldom of Aberdeen. His mother, an Ogilvie, who could count kindred with the noble houses of Deskford and Findlater, was the heiress of Auchleuchries, an estate of five or six petty farms, worth in those days about £360 Scots, or £30 sterling a year, and hopelessly burdened by mortgages. In his fifth year, G. was sent to the neighboring parish school, where he seems to have got a fair knowledge of Latin. The gates of the university were closed against him by his devotion to the Roman Catholic faith of his mother; and so, at the age of sixteen, he resolved—to use his own words—"to go to some foreign country, not caring much on what pretence, or to what country I should go, seeing I had no known friend in any foreign place."

A ship from Aberdeen landed him at Danzig in the summer of 1651, and some Scottish acquaintances or kinsfolks placed him at the Jesuit college of Braunsberg. His restless temper could not long endure the stillness and austerity of that retreat, and making his escape from it in 1653, he led for some time an unsettled life, until, in 1655, he enlisted under the flag of Sweden, then at war with Poland. During the six years that he took part in the struggle between these two powers, he was repeatedly made prisoner, and as often took service with his captors, until again retaken. He had risen to the rank of captain-lieutenant, when he resolved to try his fortune next with the czar, and, in 1661, joined the Muscovite standard.

Here his services in disciplining the Russian soldiers was duly appreciated, and his rise was rapid. He was made lieutenant-colonel in 1662, and colonel in 1665. Hearing that the death of his elder brother had made him "goodman of Auchleuchries," he wished once more to return to Scotland; but he found that there was no escape from the Russian service. The czar, however, sent him on a mission to England in 1666. On his return, he fell into disgrace, for what reason does not very clearly appear. In 1670, he was sent to serve in the Ukraine against the Cossacks; and when these were subdued, he was sent back, in 1677, to defend Tschigirin against the Turks and the Tartars. His gallant performance of that duty gained him high military reputation and the rank of major-general. In 1683, he was made lieutenant-general; and two years afterwards he obtained leave to visit England and Scotland. King James II. wished him to enter the English service; but it was in vain that he petitioned for leave to quit Russia. In 1688, he was made general and now began his intimacy with the Czar Peter, who, in the following year, owed to G.'s zeal and courage his signal triumph over the conspirators against his throne and life. Nor was this G.'s only great service to his imperial master. In 1698, he crushed the revolt of the Strelitzes, during the czar's absence from Russia. Peter was not ungrateful, and G.'s last years were passed in opulence and honor. He died at Moscow, in the morning of the 29th November 1699. "The czar," says his latest biographer, "who had visited him five times in his illness, and had been twice with him during the night, stood weeping by his bed as he drew his last breath; and the eyes

Digitized by Google

of him who had left Scotland a poor unfriended wanderer, were closed by the hands of an emperor."

G. kept a journal for the last forty years of his life. It seems to have filled eight or ten thick quartos, of which only six are now known to exist. An abridgement of them, rendered into German, under the title of "Tagebuch des Generals Patrick Gordon," was published at Moscow and St Petersburg, in 3 vols. 8vo, in 1849—1851—1853, very carefully edited by Dr Posselt. In 1859, "Passages from the Diary of General Patrick Gordon," in the original English, edited by Mr Joseph Robertson, were printed by the Spalding Club in 1 vol. 4to.

GORDON, Lord George, celebrated in connection with the London Protestant riots of 1780, the third son of the third Duke of Gordon, was born September 19, 1750. At an early age he entered the navy, and rose to the rank of lieutenant, but quitted the service during the American war, in consequence of a dispute with the Admiralty relative to promotion. Elected in 1774 M.P. for Luggershall, one of the pocket boroughs disfranchised by the Reform Bill of 1832, he soon rendered himself conspicuous by his opposition to ministers, and the freedom with which he attacked all parties; but though eccentric, he displayed considerable talent in debate, and no deficiency of wit or argument. A bill having, in 1778, passed the legislature for the relief of Roman Catholics from certain penalties and disabilities, the Protestant Association of London was, among other societies, formed for the purpose of procuring its repeal, and in November 1779, G. was elected its president. In June 1780, he headed a vast and excited mob, of about 100,000 persons, which went in procession to the House of Commons, to present a petition against the measure, when he addressed them in a speech calculated to inflame their passions and bigotry. Dreadful riots ensued in the metropolis, lasting for several days, in the course of which many Catholic chapels and private dwelling-houses, Newgate prison, and the mansion of the chief-justice, Lord Mansfield, were destroyed. G. was arrested, and tried for high treason; but no evidence being adduced of treasonable design, he was acquitted. His subsequent conduct seemed that of a person of unsound mind. Having, in 1786, refused to come forward as a witness in a court of law, he was excommunicated by the Archbishop of Canterbury for contempt. In 1787, he was convicted, on two official informations, for a pamphlet reflecting on the laws and criminal justice of the country, and for publishing a libel on the queen of France (Marie Antoinette) and the French ambassador in London. To evade sentence, he retired to Holland, but was sent back to England, and apprehended at Birmingham. Sentenced to imprisonment, he died in Newgate, of fever, November 1, 1793. He had latterly become a proselyte to Judaism.

GORDON, Sir John Watson, President of the Royal Scottish Academy, son of a captain in the navy, was born at Edinburgh about 1790. He studied for four years under John Graham, director of the Academy of the Trustees for the Encouragement of Manufacture, where he shewed the usual desire of young artists to become an historical painter, but ultimately turned his attention to portraiture, in which he achieved a distinguished reputation. G. continued to reside in his native city. He first exhibited in the Royal Scottish Academy in 1827, was elected in 1841 an Associate, in 1850 an Academician of the London Royal Academy; and on the death of Sir William Allen, President of the Royal Scottish Academy, when the honor of knighthood was conferred on him. G. was as national in his art as it is possible for a portrait-painter to be—that is to say, he excelled in transferring to the canvas those lineaments of character which are conceived to be pre-eminently Scotch. The shrewd, cautious, calculating countenance of the Caledonian has never been so happily rendered. Nearly every man of note in Scotland, and not a few in England, sat for their portrait to this artist. Among his best-known works may be mentioned, "Sir Walter Scott" (1831), "Dr Chalmers" (1837), "Duke of Buccleuch" (1842), "Lord Cockburn" (1842), "Thomas De Quincey" (1848), "Lord Robertson" (1846), "Principal Lee" (1847), "Professor Wilson" (1851), "Earl of Aberdeen" (1852), and "the Provost of Peterhead" (1853). The last picture, which is the property of the Merchant Maiden Hospital, Edinburgh, gained for G. the gold medal at the French Exposition of 1855, and may be reckoned as

Digitized by Google

among the happiest examples of portraiture in existence in any country. He died June 1864.

GORDO'NIA, a genus of trees and shrubs of the natural order *Ternstræmiaceæ*, having five styles combined into one, which is crowned with five stigmas, a 5-celled capsule, and winged seeds. Several species are natives of America, of which the most important is the LOBLOLLY BAY (*G. Lasianthus*), which is found in swamps near the sea-coast of the Gulf of Mexico. Moist tracts of considerable extent are often covered with this tree alone. It attains a height of 50 or 60 feet, has oblong, leathery, evergreen leaves, and beautiful, white, sweet-scented flowers, more than an inch in diameter. The bark is much used for tanning. In England it is cultivated with some difficulty, and generally appears as a mere bush.

GORE, in Heraldry, a charge consisting of one-third of the shield cut off by two arched lines, one drawn from the dexter or sinister chief, and the other from the bottom of the escutcheon, meeting in the fess point. A Gore Sinister is enumerated by heralds as one of the abatements or marks of dishonor borne for unknightly conduct. See GUSSET.

GORE, Mrs Catherine Grace, an English novelist, was born at East Retford, Nottinghamshire, in 1799. Her father, Mr Moody, was a wine-merchant in moderate circumstances. In 1823, she was married to Captain Charles Arthur Gore, with whom she resided for many years on the continent, supporting her family by her literary labors. They were varied and voluminous to an extraordinary degree; amounting in all to seventy works. She died at Lynwood, Hants, January 27, 1861. Her first published work was "Theresa Marchmont; or, the Maid of Honor," published in 1823. Some of her early novels, as the "Lettre de Cachet," and the "Tuileries," were vivid descriptions of the French Revolution; but her greatest successes were her novels of English fashionable life, conspicuous among which were—"Cecil; or, the Adventures of a Coxcomb," and "Cecil, a Peer," "The Ambassador's Wife," "The Banker's Wife," &c. She also wrote a prize comedy, entitled "The School for Coquettes;" "Lord Dacre of the South," a tragedy; "Bond," a dramatic poem; and other poetical and descriptive works.

GORE'E, a very small island, belonging to the French, is situated immediately south-east of Cape Verd, on the western coast of Africa. It is only about three miles in circumference, contains a town defended by a fort, and covering two-thirds of the entire surface of the island. It is considered by the French as an important commercial entrepôt; its exports are gold-dust, ivory, wax, &c. Population of the island about 7000; of the town, 3000.

GO'REY, a small municipal borough and market-town of Ireland, in the county of Wexford, is situated about 24 miles north-north-east of the town of that name, and three miles inland from the coast of St George's Channel. It is an old town, having received its charter of incorporation from James I., and consists mainly of one street of nearly a mile in length. Besides the national school and the savings-bank, the Roman Catholic chapel, with nunnery attached, built in the pointed style, may be mentioned. G. carries on a considerable trade in agricultural produce. Pop. (1871) 2689.

GORGE (Ital. *gorga*, throat), the rear-opening into any work in fortification, consists of the space between the extremities of the two sides, as between the faces of a ravelin, or between the flanks of a bastion. The demi-gorges of a bastion are lines in continuation of the curtains on each side, extending from the extremities of the flanks to the point of intersection of the lines. See also FORTIFICATION.

GORGED. When a lion or other animal has a crown by way of collar round its neck, it is said heraldically to be gorged.

GÖRGEI, Arthur, general commanding-in-chief of the Hungarian army during 1848—1849, was born at Toporcz, in the county of Szepes (Zips), February 5, 1818, and after a thorough military education, got a commission as lieutenant in the regiment of Palatine Hussars. Finding garrison-life too monotonous, and promotion slow, G. took leave of it, and turned a zealous student of chemistry at Prague. At the outbreak of the revolution, G. hastened to the seat of the first independent Hungarian ministry, offering his services, and was sent to Belgium, where he effected a

Digitized by Google

purchase of arms for the new levies of Honvéds. He first exhibited his great military capacity after the rout of the Hungarian army near Schwechat, when he was made a general, and conducted the retreat that had to be effected with consummate skill and courage. His raw levies had to be kept together and drilled under the roaring cannon of the enemy; the disaffected officers, many of them foreigners, and addicted to monarchy, to be retained under the revolutionary flag; a commissariat to be organised during fatiguing marches and constant fighting. Perczel's corps was totally dispersed at Moor; government and diet were fleeing towards the Transylvanian frontier, and the dreary wilderness of the Carpathians threatened to become the tomb of all, in the midst of a winter little less severe than that which destroyed the Grand Army of Napoleon I. At the end of December 1848, Hungary seemed to be lost; at the beginning of March 1849, G. was concerting a plan for driving the enemy out of the country. After Dembinski's failure as general-in-chief, G. was declared the head of the united army corps of the north (hitherto his own), of the Upper Theiss, under Klapka, and of Szolnok, under Damjanich. Forty thousand men, the finest army Hungary ever saw, broke forth from behind the Theiss, and drove the Austrians, with bloody losses, from one position to another. The battles of Hatvan, Bitske, Isaszeg, Gödöllö, Vácz, Nagy-Sarlo, were a succession of triumphs. Pesth was evacuated by the enemy, the siege of Komorn was raised, and before the month of April was over, nothing was left in the enemy's hands except a small strip on the western frontier, and the impregnable fastnesses which surround Tittel on the Lower Theiss. Buda, the ancient capital of the realm, well fortified and garrisoned, was to be stormed, and for this the victorious campaign had to be interrupted. The delay was fatal. Russian armies hastened to the rescue of Austria, and regiments of veterans were dispatched by Radetzky, the war in Italy being nearly over. The fortress of Buda was carried on the 21st of May, but the flower of the Hungarian infantry was buried among its ruins. In the latter part of June, the Austro-Russian army, under Haynau and Panjutine, beat G. near Zsigard; and the affair at Györ (Raab) resulted in the retreat of the Hungarians close to the walls of the fortress of Komorn. On the 2d of July, a bloody battle was fought near Szöny, where G. gave proofs of indomitable courage. On the 16th of July, a desperate fight took place in and near Vácz between Russians and Hungarians. G., after some weeks, arrived in the neighborhood of Arad with an army decimated by continual fighting, by heavy marches, and by dysentery. At Debreczin the corps of Nagy-Sándor was sacrificed in order to allow an agonising march of a few days. On the 9th of August, the lower army, under Dembinski, was annihilated in the battle of Temesvár, and on the 10th, G. was declared dictator by a council held in the fortress of Arad, under the presidency of Kossuth. But further resistance on the part of the Hungarians was now hopeless, and on the 13th G.'s army surrendered at Világos to Prince Paskiewitch, commander-in-chief of the Russian forces. This surrender has been often imputed as treachery to Görgei. Whether such an imputation is excusable, may be best judged from the circumstance, that on the day of surrendering G. had 24,000 men with 140 cannon, and that five armies, with more than 200,000 men and 1000 cannon, were closing upon him from different directions. G. was confined to Klagenfurt, whence he was released on parole, and engaged in chemical studies. In 1852, he published a work at Leipsic (a translation of which appeared at London in the same year), under the title, "Mein Leben und Wirken in Ungarn in den Jahren 1848 und 1849;" and in 1859, "Hungary in 1849 and after 1866."

GO'RGET (Ital. *gorgietta*, from *gorga*, a throat), that part of ancient armor which defended the neck.—Also a crescent-shaped ornament formerly worn by military officers on the breast.

GORGET (Fr. *gorgeret*, from *gorge*, the throat), a surgical instrument, or rather a series of surgical instruments, devised to facilitate the operation of Lithotomy (q. v.). They are now almost entirely out of use.

GO'RGIAS, a celebrated Greek rhetorician, of the time of Socrates, was born at Leontini, in Sicily, and settled in Greece, residing for the most part at Athens, and at Larissa in Thessaly. He died at the age of 105 or 109. G. has been immortalised by Plato in a Dialogue which bears his name. Two works attributed to him are extant, "The Apology of Palamedes," and the "Encomium on Helena," but their

Digitized by Google

genuineness has been disputed by several critics. G. displayed little aptitude for theorising on the art which he professed to teach, and was not remarkable for speculative acumen generally, but he would appear to have been a quick and judicious *observer*. He avoided, according to Plato, general definitions of virtue and morality, but, on the other hand, Aristotle notices that he had a true appreciation of the facts of morality, as they are manifested in life and character and the picture given of him by Plato is in harmony with this remark. He did not wish to be thought a *sophist*, but only a *rhetorician*, and the ancients were in fact at a loss whether to consider him the latter or both.

GO'RGO, or Gorgon, according to Homer, a frightful monster inhabiting the infernal regions, the head of which was peculiarly appalling. Homer and Euripides make mention of only one G., the daughter of Terra, who was slain by Minerva, while Hesiod mentions three Gorgones—Stheno, Euryale, and Medusa, the daughters of Phorcys and Ceto, for which reason they are called likewise the Phorcides. Their habitation, according to the same author, was in the Western Ocean, in the neighborhood of Night and the Hesperides; while Herodotus and other later writers place it in Libya. They are represented as girded with serpents with heads erect, vibrating their tongues, and gnashing their teeth. Æschylus describes them as winged virgins with brazen claws, and enormous teeth, having two serpents round their bodies by way of girdle. The name G. was given more especially to Medusa. According to later legends, Medusa was originally a very beautiful maiden, and the only one of the three sisters who was mortal. But she having become a mother by Neptune in one of Minerva's temples, that virgin goddess was so affronted, that she changed Medusa's hair into serpents, which gave her so fearful an appearance that whoever looked on her was turned into stone. Medusa was killed by Perseus (q. v.), and her head was afterwards placed in the shield of Minerva. Various explanations have been given of the myth both by the ancients and the moderns, but no one in particular can be said to be satisfactory.—Compare Levezow, "Ueber die Entwickelung des Gorgonenideals in der Poesie und bildenden Kunst der Alten" (Berlin, 1838).

GORGO'NIA, a genus of zoophytes (*Anthozoa*), allied to *Alcyonium* (q. v.) The whole structure (polype-mass) is rooted and branching, consisting of a horny central axis with a polypiferous flesh, which when dried becomes a friable crust full of calcareous spicules. The hard stem is composed of concentric layers, probably formed in succession by consolidation of the fleshy substance. The stem is usually brown or black, whilst the flesh, or even the dried crust, often exhibits colors of great brilliancy. The polypes have eight tentacles. Several species of G. are rare British zoophytes; but the species most generally known is *G. flabellum*, or the *Flabellum Veneris*, also called the Sea-fan, a tropical species, often brought home as a curiosity from the West Indies, which exhibits in a striking manner the flat shape, more or less characteristic of this genus, and of the family *Gorgoniadæ*.

GO'RHAM CONTROVERSY. The Gorham controversy arose out of the refusal of Henry Philpott, Bishop of Exeter, to institute the Rev. Cornelius Gorham, formerly fellow of Queen's College, Cambridge, and then vicar of St Just-in-Penrith, to the vicarage of Brampford Speke, on his presentation thereto by the Lord Chancellor. The alleged ground of this refusal was, that after examination the bishop found Mr Gorham to be of unsound doctrine as to the efficacy of the Sacrament of Baptism, inasmuch as he held that spiritual regeneration is not given or conferred in that sacrament, and in particular, that infants are not made therein "members of Christ and the children of God," as the catechism and formularies of the church declare them to be. The case was brought before the Arches Court of Canterbury, which decided (1849) that baptismal regeneration is the doctrine of the Church of England, and that Mr Gorham maintained doctrines on the point opposed to those of the church, and that consequently the bishop had shewn sufficient cause for his refusal to institute, and that the appeal must be dismissed with costs. From this decision, Mr Gorham appealed to the judicial Committee of Privy Council. The committee complained that the bishop's questions were intricate and entangling, and that the answers were not given plainly and directly. Their decision was in substance as follows; and it must be noted what points they undertook

Digitized by Google

to decide, and what not. The court declared that it had no jurisdiction to settle matters of faith, or to determine what ought, in any particular, to be the doctrine of the Church of England, its duty being only to consider what is by law established to be her doctrine upon the legal construction of her articles and formularies. It appeared that very different opinions as to the sacrament of baptism were held by the promoters of the Reformation; that differences of opinion on various points left open were always thought consistent with subscription to the articles; and also, that opinions in no important particular to be distinguished from Mr Gorham's had been maintained without censure by many eminent prelates and divines. Without expressing any opinion as to the theological accuracy of Mr Gorham's opinions, the court decided that the judgment of the Arches Court should be reversed. Mr Gorham was accordingly instituted to Brampford Speke. During the two years that the suit was pending, the theological question was discussed with all degrees of ability and acrimony in sermons and pamphlets; and it was expected that if the judgment had gone the other way, a large body of the evangelical clergy, who for the most part hold views more or less in accordance with those of Mr Gorham, would have seceded from the church.

GORICA, a town of the Austrian Empire, in Croatia, 10 miles south-south-east from Agram, in the valley of the Save. Pop. 7902.

GORI'LLA (*Troglodytes Gorilla*), a great African ape, generally referred by naturalists to the same genus with the chimpanzee, although Professor Isidore Geoffroy St Hilaire has attempted to establish for it a separate genus. It has received the name by which it is now known in consequence of its being supposed to be the same animal which is mentioned in the "Periplus" of Hanno the Carthaginian navigator, who visited the tropical parts of the west coast of Africa about the year 350 B.C., although it is by no means certain that the G. of Hanno is not the chimpanzee. Vague accounts of apes of great size, and of which very wonderful stories were told, were from time to time brought from Western Africa; but it was not till 1847 that the G. became really known to naturalists, when a skull was sent to Dr Savage of Boston by Dr Wilson, an American missionary on the Gaboon river. Since that time, not only have skeletons and skins been obtained in sufficient number for scientific examination, but information has also been procured concerning the habits of the animal in its native haunts. The accounts of the G. given in Du Chaillu's "Explorations and Adventures in Equatorial Africa" (Lond. 1861), are regarded by the highest scientific authorities, and particularly by Owen, as in the main trustworthy, notwithstanding all the doubt that has been cast over that traveller's narrative of his adventures; and there is little doubt that they are in accordance with all that we have learned from other sources, and with the inferences to be deduced from the dentition and osteology of the animal.

The G. differs from the chimpanzee in its greater size; the height of an adult male in an erect posture being commonly about five feet six inches or five feet eight inches, although there is reason to think that it sometimes exceeds six feet. Its strength appears also to be greater in proportion to its size, and even its skeleton indicates very great muscular power both in the jaws and limbs. The bony ridges in the skull above the eyes are extremely prominent; and the skull of the male also exhibits a large occipital ridge on the top of the head. The brain is small. The nasal bones project more than in the chimpanzee, thus producing an approximation to the human face, in a somewhat prominent nose. The lower part of the face, however, projects very much; and besides that the teeth do not form a perfectly uninterrupted series, as in man, the canine teeth are very large, particularly in the male, projecting considerably more than an inch from the upper jaw, much larger in proportion than in the chimpanzee; although, on the other hand, the molars bear a greater proportion to the incisors, and thus approach more to the human character. The breadth at the shoulders is great. There are thirteen pair of ribs. The pelvis approaches the human form more than in any other ape. The arms are not so long as in the chimpanzee, but reach nearly to the knee in the erect position. The lower limbs, although shorter in proportion than in man, are longer than in the chimpanzee. The foot is less turned inward than in the chimpanzee, and is better fitted for walking on the ground; the great toe is a true thumb, as in the chimpanzee, standing out from the

Digitized by Google

foot at an angle of about 60°, and is remarkably large and strong. The hands or paws of the fore limbs are also remarkable for their great size, their thickness, and their strength. The fingers are short, but the circumference of the middle finger at the first joint is sometimes more than six inches. The G. has a black skin, covered with short dark-gray hair; reddish brown on the head; the hair on the arms longer, that on the arm from the shoulder to the elbow pointing downwards, and that on the fore-arm pointing upwards to the elbow, where a tuft is formed. The face is covered with hair, but the chest is bare. There is scarcely any appearance of neck. The mouth is wide, and no red appears on the lips. The eyes are deeply sunk beneath the projecting ridge of the skull, giving to the countenance a savage scowl, the aspect of ferocity being aggravated by the frequent exhibition of the teeth. The belly is very large and prominent, in accordance with which character the G. is represented as a most voracious feeder, its food being exclusively vegetable—partly obtained by climbing trees, and partly on the ground. It is very fond of fruits and of some leaves, as the fleshy parts of the leaves of the pine-apple, and employs its great strength of jaws and teeth in tearing vegetable substances and cracking nuts which would require a heavy blow of a hammer. It is not gregarious in its habits. It spends most of its time on the ground, although often climbing trees. It is capable of defending itself against almost any beast of prey. It has a kind of barking voice, varying when it is enraged to a terrific roar. It inhabits exclusively the densest parts of tropical forests, and is only found in regions where fresh water is abundant. It is much dreaded by the people of the countries in which it is found, although by some of the tribes its flesh is sought after for food. Many strange stories are current among them about its habits, which seem entitled to little regard—as for example, of its carrying away men and women, and detaining them for some time in the woods—of its lying in wait on the branch of a tree till a man passes beneath, furtively stretching down one of its hinder legs to catch him, and holding him in the grasp of its foot, or rather hand, till he is strangled, and the like. The G. has not been hitherto tamed, and in an adult state at least, seems very incapable of it. In 1876 a live G. was brought to Berlin, the first authentic instance of the introduction of the animal into Europe. The name given to this animal in its native country is *Ngina*, or *Ingeena*.

Du Chaillu has described, as discovered by himself, two other species of *Troglodytes*, the Koolo-kamba (*T. Koolo-kamba*) and the Nshiego-Mbouvé (*T. calvus*), smaller than the G.; the latter remarkable for making an umbrella-like shelter of leaves placed against a branch to protect itself from the rain.

GO'RKHA, a town of Nepaul, stands in lat. 27° 52' n., and in long. 84° 28' e. Originally the seat of the reigning dynasty of the country, it gives name to the dominant race—a race noted alike for fidelity and valor during the mutiny of 1857. G. is 53 miles to the west of Khatmandu, the capital of the state.

GO'RKUM (Dutch, *Gorinchem*), a town and fortress in the Netherlands province of S. Holland, is situated on the Merwede, where it is joined by the Linge, 22 m. e.s.e. of Rotterdam. It is well-built, has a town-house, military establishments, and a trade in agricultural produce and fish, especially salmon. Ship-building, making leather ropes, beer, book-printing, &c., are chief industries. Pop. (1875) 8982.

GÖ'RLITZ, a fortified town of Prussia, in the province of Silesia, is a principal station on the railway from Dresden to Breslau, and is situated on a declivity on the left bank of the Neisse, 52 miles west of Liegnitz. It is well built, is surrounded by old walls, and flanked with towers, the chief of which is the Kaisertrutz, now the guard-house and armory of the town. Among the many beautiful Gothic churches, the most interesting is that of St Peter and St Paul, built 1423—1497, and having five naves, a magnificent organ and a bell 12¼ tons in weight. In the north-west of the town is the Kreuzkapelle (Chapel of the Cross), an imitation of the Holy Sepulchre at Jerusalem. G. has also a gymnasium with an excellent library, numerous educational and benevolent institutions, and a theatre. A viaduct upwards of 1500 feet in length, and 115 feet high, one of the grandest in the north of Germany here crosses the valley of Neisse. G. has manufactures of cloth, leather, glass, tobacco and machinery; has extensive weaving and bleaching, and a lively transit trade. In eight cloth factories, driven by water and steam power, 1600 workers produce nearly 20,000 pieces of cloth annually. Pop. (1875) 45,348.

GÖRLITZ PROCESS is the name of a celebrated trial which took place in Germany in 1850. It was occasioned in this way: On the 13th of June 1847, the Countess of Görlitz was strangled by a servant of her own named Johann Stauff, whom she had caught stealing some valuables from an open desk in her sitting-room, and her corpse was found a few hours after burned by a combustible stuff heaped upon her. After more than two years spent in the preliminary investigation, the case was tried before the assizes at Darmstadt, 11th of March 1850, and occupied a whole month. The murderer, who obstinately denied having committed the crime imputed to him, was condemned to imprisonment for life. But the scientific interest of the case arose from its having led to a discussion on the possibility of the spontaneous combustion of the human body. While the physician, Von Siebold, declared in favor of the possibility, the chemists Bischoff (q. v.) and Liebig (q. v.) sought to demonstrate the opposite opinion, which is generally held by scientific men. See SPONTANEOUS COMBUSTION.

GÖRRES, Jacob Joseph von, a distinguished German author, was born at Coblenz, January 25, 1776. In common with most of the ardent youth of the time, G. threw himself eagerly into the movement of the French Revolution; became an active member of the clubs and debating societies which sprung up in all the towns upon the French border, and established a newspaper, entitled the "Red Journal," which was the exponent of the most extreme opinions of the time. In the year 1799, he went to Paris as the chief of a deputation to negotiate the annexation of the Rhineland to the French Republic, but the revolution of the 18th Brumaire put an end to this and all similar dreams. G. returned to Germany, disgusted with politics, quietly settled down in a professorship in his native town, and devoted himself exclusively to literature for several years. His works on art, on physiology, on the laws of organism, and on the relations of faith and science, attracted much attention. In 1806, he published the first part of his well-known collection of "German Popular Legends;" and in 1808, his work on the mythology of the Asiatic nations, and a further contribution to the legendary literature of Germany. From these studies, however, in common with the great body of the German nation, he was aroused to the hope of liberation from French tyranny, by the reverses of the French arms in the Russian expedition. G. was not slow to appeal to the national sentiment of his countrymen in the "Rhenish Mercury," one of the most spirit-stirring journals which Germany had ever possessed; he became, in truth, the literary centre of the national movement. After the re-establishment of German independence, G. continued the career of a journalist, and addressed himself against the encroachments of domestic absolutism with the same energy with which he had denounced the tyranny of foreign occupation; until, having drawn upon himself the displeasure of the government, he was obliged to flee to France, and afterwards to Switzerland. In 1827, he gladly accepted the professorship of the History of Literature in the new university just then founded at Munich by the liberal King Ludwig of Bavaria. From this date, G. made Munich his home, and his later years were devoted to literature, and in part also to the animated religious controversies occasioned in Germany by the contests between the Archbishop of Cologne and the Prussian government on the subject of mixed marriages and Hermesianism. See HERMES. In all these controversies, G., who was an ardent Roman Catholic, took an active and influential part. He was, if not the originator, at least the main supporter of the well-known Roman Catholic journal, the "Historisch-Politische Blätter." His last work of importance was his "Christliche Mystik" (Ratisbon, 1836—1842). He died January 27, 1848. See the "Historish-Politische Blätter," 1848, and Herzog's "Realencyclopädie."

GORT, a small but thriving town of Ireland, in the province of Connaught, is prettily situated on a small stream in the county of Galway, and close to its southern boundary, 17 miles north-north-east of the town of Ennis. Its trade is chiefly retail. Pop. (1871) 1773.

GORTSCHAKOFF, a Russian family, traces its ancestry through St Michael of Tschernigoff (born 1246) to Rurik and Vladimir the Great.—PRINCE PETER G., governor of Smolensk, defended that town two years (1609—1611) against Sigismund of Poland, when it was taken by storm.—PRINCE DIMITRI G., born 1756, was a celebrated Russian poet, and wrote odes, satires, and epistles. He died 1824.—PRINCE

Digitized by Google

ALEXANDER G., born 1764, served under his uncle Suwaroff in Turkey and Poland, displayed great courage at the capture of Praga (a suburb of Warsaw), and was made lieutenant-general in 1796. In the campaign of 1799, he commanded under Korsakoff at Zürich, was subsequently made military governor of Viborg, repulsed Marshal Lannes at Heilsburg, and commanded the right wing at the battle of Friedland. Appointed minister of war in 1812, he filled this post to the end of the war, when he was made general of infantry, and member of the imperial council. He died in 1835.—PRINCE ANDREAS G. served in 1799 as major-general under Suwaroff in Italy, and commanded a division of grenadiers at Borodino, in 1812, where he was wounded. In the campaign of 1813—1814, he commanded the 1st corps of Russian infantry, and distinguished himself at Leipsic and Paris. He was made general of infantry in 1819, and in 1828 retired from active service.—PRINCE PETER G. was born in 1790. Having made the campaigns of 1813 and 1814, he served in Caucasia under General Yermoloff. As chief of the general staff of Wittgenstein in 1826, he was one of the signers of the Treaty of Adrianople. In 1839, he was appointed governor-general of Eastern Siberia, and occupied that important post until, in 1851, he retired from active life. On the outbreak of the Crimean war, however, he offered his services, which were accepted; and at the battle of the Alma he commanded the left wing of the Russians. He also took part in the battle of Inkermann. He died in 1868.

GORTSCHAKOFF, Prince Mikail, brother of the preceding, was born in 1795, commenced his military career as an officer of artillery, and distinguished himself in 1828 at the sieges of Silistria and Schumla. Chief of the staff of Count Pahlen in 1831, he gave proofs of extraordinary valor in the battle of Ostrolenka and at the taking of Warsaw. He was wounded at Grohow, and made general; succeeded Count Toll as chief of the staff of the whole army, was appointed general of artillery in 1843, and military governor of Warsaw in 1846. In 1853, he commanded the Russian forces in the Danubian provinces, crossed the Danube, at Braila, March 23, 1854, occupied the frontiers of Bessarabia, and in March 1855 directed the defences of Sebastopol, attacked by the armies of Great Britain and France. As a reward for his services in this unsuccessful but still brilliant defence, Prince G. was appointed by the Emperor Alexander II. lieutenant-general of the kingdom of Poland, and was for several years a wise and conciliatory representative of his youthful emperor at Warsaw. He died May 30, 1861.—PRINCE ALEXANDER M., Russian diplomatist, brother of the preceding, was born in 1798. He was secretary of the Russian embassy in London in 1824, was sent to Florence in 1830, to Vienna in 1832, and to Stuttgart in 1841. In 1854 he represented Russia in the Vienna conferences; and in 1856 he became Minister of Foreign Affairs. In 1870, he issued his circular upsetting the treaty of 1856, and leading to the London Conference of 1871. He was the guiding spirit of Russian policy during the critical period 1877—79, and was one of the most prominent members of the Berlin Congress in 1878.

GORUCKPO'RE, a city of Hindustan, in the lieut.-governorship of the North-West Provinces, and capital of a district of the same name, stands on the left bank of the Rapti, which joins, 85 miles further down, the Ghagra from the left, the whole of the intermediate course being navigable. It is in lat. 26° 42′ n., and long. 83° 28′ e., being 430 miles to the north-west of Calcutta; and it contained (1872) 51,117 inhabitants.—The district of G. has an area of 4579 square miles, and a population of 2,019,861.

GORY DEW, a dark red slimy film not unfrequently to be seen on damp walls and in shady places; often on the whitewashed walls of damp cellars, where its appearance is apt to occasion alarm from its resemblance to blood. It is one of the lowest forms of vegetable life, one of the *algæ* of the group *Palmellaceæ* (included in *Confervaceæ*), and nearly allied to the plant to which the phenomenon of RED SNOW (q. v.) appears to be chiefly owing. Its botanical name is *Palmella cruenta*. It sometimes extends over a considerable surface, and becomes a tough gelatinous mass. The structure and mode of growth of this and allied plants will be noticed under the head PALMELLACEÆ. Its characteristic red color appears also in *Hæmatococcus sanguineus*, a nearly allied plant, found in similar situations, but which seems to extend more as an aggregation of cells, not soon melting down into an indefinite slime like the cells of the *Palmella*. The prevalent color of the group, however, is green.

Digitized by Google

GÖRZ, or Gō'ritz, an important town of Austria, in the crown-land of the Kustenland (Coast Districts), (q. v.), and capital of a district of the same name, is charmingly situated in a fruitful plain on the left bank of the Isonzo, about 25 miles north-north-west from Trieste. Among its principal buildings are the old castle of the former Counts of Görz, now used as a prison; and the cathedral, with a beautiful *sacrarium*. G. has extensive sugar-refining, and manufactures of roseglio, silks, linen, cotton, and leather; it has also a thriving trade in its manufactures and in dried fruits. Charles X. of France died here, Nov. 6, 1837. Pop. (1869) 16,823.

GO'SHAWK (*Astur*), a genus of *Falconidæ* (q. v.), distinguished from the true falcons by a lobe or festoon, instead of a sharp tooth, on the edge of the upper mandible, and by the shortness of the wing, which reaches only to the middle of the tail. It is more nearly allied to the sparrow-hawks, from which it is distinguished by its more robust form, by its shorter legs, and by the middle toe not being elongated, as in that genus. The species to which the name G. originally and strictly belongs (*A. palumbarius*), is very widely diffused over Europe, Asia, the north of Africa, and North America, chiefly inhabiting hilly and wooded regions. It is now very rare in Britain, particularly in England. Although one of those that were called *ignoble* birds of prey, it was much used for falconry, being easily trained, and very successful in catching such game as is either confined to the ground, or does not rise far from it, or such as is to be found in woods, through the branches of which the G. readily threads its way in pursuit. The G. was thus flown at hares, rabbits, pheasants, partridges, &c. It ordinarily seeks its prey by flying near the ground, and can remain a very long time on the wing. It follows its prey in a straight line, not rising in the air to descend upon it, like the falcons; and when baffled by the object of pursuit entering a wood and hiding itself in some covert, will perch on a bough, and await its reappearance with wonderful patience for many hours. Its flight is very rapid. The G. builds in trees. Its nest is very large. The female, which is much larger than the male, is about two feet in entire length. Both sexes are of a dark grayish-brown color, the upper surface of the tail-feathers barred with darker brown: there is a broad white streak above each eye; the under parts are also whitish, with brown bars and streaks.—Other species are found in India, South Africa, Australia, &c.

GO'SHEN, the name of that part of ancient Egypt which Pharaoh made a present of to the kindred of Joseph when they came to sojourn in that country. It appears to have lain between the eastern delta of the Nile and the frontier of Palestine, and to have been suited mainly for a pastoral people, which the Hebrews were. Rameses, the principal city of the land, was the starting-point of the Exodus of the chosen people, who reached the Red Sea in three days. From this and other circumstances, it has been concluded that the *Wâde-t-Tumeylât* (the valley through which formerly passed the canal of the Red Sea, and at the western extremity of which Rameses was situated) is probably the G. of the Old Testament.

GO'SLAR, a small but ancient and interesting town of Hanover, is situated on the border of Brunswick, on the Gose, from which the town derives its name, 26 miles south-east of Hildesheim. It was at one time a free imperial city, and the residence of the emperor. Of all the fortifications of which it once boasted, the walls and one tower—the Zwinger, the walls of which are 21 feet thick—alone remain. Of the venerable cathedral, the porch (date 1150) is the sole relic; the remaining portion of the old imperial palace has been lately restored; the Gothic church in the market-place dates from 1521; the hotel called the *Kaiserworth* has eight portraits of German emperors. G. was founded by Heinrich I. about 920; and under Otto I. the mines, for which G. has ever since been celebrated, were opened in 986. The mines of gold, silver, copper, lead, and zinc are, however, nearly exhausted. Pop. (1875) 9838.

GOSPEL SIDE OF THE ALTAR, the right side of the altar or communion table, looking from it, at which, in the English Church service, the gospel appointed for the day is read. It is of higher distinction than the epistle side, and is occupied by the clergyman of highest ecclesiastical rank who happens to be present. In some cathedrals, one of the clergy has this special duty to perform, and is designated the Gospeller.

Digitized by Google

GOSPELS. The expression is derived from the Anglo-Saxon, and means literally *good news*. The message of Christ, or the doctrine of Christianity, was called the Gospel (*to euaggelion*); and the inspired records by which this message or doctrine have been transmitted to the church in successive ages, have received the name of the Gospels (*ta euaggelia*). When this name was first distinctly applied to these records, is uncertain. The use of it in Justin Martyr, about the middle of the 2d c., is a subject of dispute. It appears to have been in common use in the course of the third century.

1. *Genuineness.*—The primary and most interesting inquiry concerning the Gospels is as to their genuineness. They profess to be the inspired records of our Lord's life—of his sayings and doings—proceeding in two cases from men who were his apostles and companions (Matthew and John); and in the two other cases from men who, although not themselves apostles, were apostolic in their position and character, the immediate companions and fellow-laborers of the apostles (Mark and Luke.) According to their profession, they were all composed during the latter half of the 1st c.; the three *Synoptic* Gospels, as they are called, probably during the decade preceding the destruction of Jerusalem by Titus (60—70), and the fourth Gospel of St John near the close of the century. The question as to their genuineness is in the main the question as to the fact of their existence at this early period; the special authorship of each Gospel is a comparatively less important question.

It is obvious that the existence of the Gospels within the 1st c. is a point which can only be settled by the ordinary rules of historical evidence. What traces have we of their existence at this early period? As Paley illustrates the matter, we can tell of the existence of Lord Clarendon's "History of the Rebellion" at a period antecedent to Bishop Burnet's "History of his Own Times," by the fact that Burnet quotes Clarendon. If the Gospels existed in the 1st c., therefore, we shall expect to find similar evidences of their existence in the Christian writings of the 2d and 3d centuries. We do find such evidence in abundance during the 3d century. In such writings as Origen and Cyprian, we not only find quotations from the Gospels, but we find the Gospels themselves mentioned by name as books of authority amongst Christians. From the writings of Origen, alone, if they had survived, we might have collected, it has been said, the whole text not only of the Gospels, but of the Old and New Testaments. At this point, then, there is no question. No one can dispute the existence of the Gospels in the age of Origen, or that immediately preceding—that is to say, in the beginning of the 3d century. But we can ascend with an almost equally clear light of evidence to the time of Irenæus, or the last quarter of the 2d century. The passage in which Irenæus speaks of the Gospels is so significant and important that it deserves to be extracted. "We," he says (Contra hæres. lib. iii. c. 1), "have not received the knowledge of the way of our salvation by any others than those through whom the Gospel has come down to us; which Gospel they first preached, and afterwards, by the will of God, transmitted to us in writing, that it might be the foundation and pillar of our faith." "For after our Lord has risen from the dead, and they (the apostles) were clothed with the power of the Holy Spirit descending upon them from on high, were filled with all gifts, and possessed perfect knowledge, they went forth to the ends of the earth, spreading the glad tidings of those blessings which God has conferred upon us. Matthew among the Hebrews published a Gospel in their own language; while Peter and Paul were preaching the Gospel at Rome and founding a church there. And after their departure (death), Mark the disciple and interpreter of Peter himself delivered in writing what Peter had preached; and Luke, the companion of Paul, recorded the Gospel preached by him. Afterwards, John, the disciple of the Lord, who leaned upon his breast, likewise published a Gospel while he dwelt at Ephesus in Asia." These words are very explicit and to the point; and elsewhere, Irenæus speaks still more particularly of the several Gospels, and endeavors to characterise them in a somewhat fanciful way, which, if it does not prove his own judgment, at least proves the kind of veneration with which the Gospels were regarded in his time. It is equally beyond question, then, that the Gospels were in existence in the end of the 2d c., and that they were attributed to the authors whose names they bear. "It is allowed by those who have reduced the genuine apostolic works to the narrowest limits, that, from the time of Irenæus, the New Testament was composed essen-

tially of the same books as we receive at present; and that they were regarded with the same reverence as is now shewn to them."—Westcott, "History of Canon." The evidence upon which we accept as undoubtedly genuine the productions of many classic authors, is not to be compared in clearness and fulness to the evidence for the genuineness of the Gospels at this stage. Any difficulties that the subject involves begin at a point higher up than this.

The age of Irenæus is the *fifth* generation from the beginning of the apostolic era—the *third* from the termination of it. The ascending generations may be characterised as those (4) of Justin Martyr, and (3) of Ignatius and Papias; and (2) of St John, or the later apostolic age. It is within these three generations, and especially within the third and fourth, that the subject of the genuineness of the Gospels gives any cause for hesitation and discussion.

Such writers as Justin Martyr and Ignatius nowhere quote the Gospels by name. In a fragment of Papias preserved by Eusebius, there is mention of Matthew and Mark having written accounts of the actions and discourses of our Lord; but with this exception, there is no mention of the Gospels, or of their authors by name, in these earlier Christian writers. Not only so, but Justin Martyr appeals constantly to sources of information which he styles not "Gospels" of St Matthew, St Luke, or St John, but "Memoirs of the Apostles" (*apomnē-moneumata tōn apostolōn*). The phrase *a kaleitai euaggelia* (which are called gospels), which follows the former in the common versions of Justin's text, is supposed by many to be an interpolation. This has given rise to a good deal of discussion as to the effect of Justin Martyr's evidence on this subject. The discussion has been of this nature. Were these "Memoirs of the Apostles" our Gospels, or were they some other books of information as to Christ's sayings and doings to which he had access? Many German critics have been confident they were not our Gospels; and Bishop Marsh has gone the length of saying, that Justin did not quote our Gospels. The question, therefore, as to whether Justin Martyr quotes our Gospels, may be said to be the turning-point in the evidence for their genuineness. Although not altogether free from difficulty, it appears to us that no reasonable doubt can be entertained that the "Memoirs of the Apostles" to which Justin constantly refers were no other than our Gospels. This appears conclusively established by the three following considerations: (1) The degree of coincidence which exists between the numerous passages which Justin quotes from his "Memoirs," and the corresponding passages in the Gospels.—The *verbal* coincidence with the text of the Gospels is sometimes exact, and sometimes so nearly so as to appear exact in a translation. The want of entire verbal coincidence is just what might be expected in a writer like Justin, who quotes the Old Testament in the same general manner, and is the very same as we find in other writers both before and after him. Further, the account which he gives of the origin of the "Memoirs" corresponds with the origin of the Gospels—viz., that two were written by apostles, and two by companions of the apostles. (2) The extreme improbability that there could have been other books besides the Gospels of the same apparently authoritative character, all trace of which have disappeared, and of which, in fact, we find no indication save in Justin Martyr.—Everything seems against such a supposition. The books of which Justin speaks were read in the assemblies of the Christians on Sundays; they were regarded with respect and veneration; they were evidently looked upon as authoritative. It is wholly inconceivable, that if there were such books other than the Gospels, they should not have been mentioned by other writers as well as Justin; or that they should have utterly perished. (3) The certainty, from the statements of such writers as Irenæus in the generation immediately following him, that Justin must have known our Gospels.—In this later generation we find the Gospels everywhere diffused: received and reverenced alike at Alexandria, Lyons, and Carthage; by Clemens Alexandrinus, Irenæus, and Tertullian. They could not all at once have attained this wide diffusion, or started into this position of authority. The manner in which Irenæus speaks of them can only be accounted for by the fact, that he had received them from his teachers; that they had been handed down to him as inspired authorities from the first ages. We must take the light of such a statement with us in ascending to the age of Justin Martyr; and in this light it is unintelligible that the Gospels should not have been known to Justin, and consulted by him. The mere fact of his calling his authorities by the peculiar name of "Memoirs" cannot be set against all this evidence. The name of "Me

Digitized by Google

moirs," indeed, rather than Gospels, was only a natural one for this writer to use, with his classical predilections and philosophical training, and considering that he was addressing a heathen emperor, and through him the Gentile world at large.

When we ascend beyond the age of Justin to Ignatius and Papias, we find in a fragment of the latter, as has been already stated, mention of Matthew and Mark having written accounts of the life of the Lord; while in the letters of the former, as in the still earlier Epistle of Clemens Romanus and the so-called Epistle of Barnabas—both of which belong to the 1st c., and consequently reach the apostolic age itself—we find various quotations that seem to be made from the Gospels. The quotations from St Matthew are the most numerous. If these quotations stood by themselves, it might be doubtful how far they constituted evidence of the existence of the Gospels at this early period. They might possibly indicate merely a uniformity of oral tradition as to the sayings of our Lord; but when we regard them in connection with the position of the writers, and the whole train of thought and association in which they occur, they seem to bear out the widest conclusion we could wish to found on them. The existence and character of such men as Ignatius and Clemens are unintelligible save in the light of the Gospel history.

In addition to this chain of direct Catholic evidence for the genuineness of the Gospels, the fragments which have been preserved of heretical writers furnish important, and in some respects singularly conclusive evidence. The Gnostic Basilides quotes the Gospels of St John and St Luke about the year 120. The heretics appealed to them as well as the Catholic writers, and in this fact there is a strong guarantee that no fictions or inventions could have been palmed off upon the church in the 2d c., as the most renowned German theory as to the origin of the Gospels virtually supposes. Upon a review of all the evidence from the apostolic Fathers down to the council of Laodicea, when the four Gospels are reckoned as part of the canon of Scripture, "there can hardly be room for any candid person to doubt," it has been said, "that from the beginning the four Gospels were recognized as genuine and inspired—that a line of distinction was drawn between them and the so-called apocryphal Gospels." As a mere question of literary history, the genuineness of the Gospels certainly rests on far higher evidence than that on which we receive, without hesitation, many ancient writings.

2. *Internal Character and Contrast.*—After the genuineness of the Gospels, the next point of importance regarding them is the relation which they bear to one another in respect of their contents and arrangement—the coincidences and discrepancies with one another which they present. The most obvious distinction among the Gospels as a whole is between the Gospel of St John and the three Synoptical Gospels, as they are called. Matthew, Mark, and Luke, in narrating the ministry, discourses, and miracles of our Lord, confine themselves exclusively to what took place in Galilee until the last journey to Jerusalem. We should not know from them of the successive journeys that our Lord made to Jerusalem. John, on the contrary, brings into view prominently his relation to Judea; and of the discourses delivered in Galilee, he only records one, that, namely, in the 6th chapter. It is obvious, on a superficial glance, that John had a special object in writing his Gospel, an object in some respects more *dogmatical* than historical; and it is probable that, having seen the preceding Gospels, he purposely abstained from writing what they had already recorded, and sought to supply such deficiences as appeared to exist in their records. When we have no knowledge of the subject, this at least seems as probable a supposition as any other. A comparison of the three Synoptical Gospels reveals some interesting results. If we suppose them respectively divided into 100 sections, we shall find that they coincide in about 53 of them: that Matthew and Luke further coincide in 21; Matthew and Mark in 20; and Mark and Luke in 6. This, of course, applies to the substantial coincidence of fact and narrative in each case. The relative verbal coincidence is by no means so marked; it is, however, very considerable, and presents some interesting features, which Professor Andrew Norton has set forth clearly in his admirable work on the "Genuineness of the Gospels."

It is not desirable to go into further details in this place; but the result of the extremely critical and minute scrutiny to which the text of the Gospels has been subjected may be stated as follows. There is a singular coincidence in substance in the three Synoptic Gospels. "Substantial unity with circumstantial variety," is a saying

Digitized by Google

strictly true of them—more true of them than of any authors professing to narrate the same circumstances. The coincidence is greatly more apparent in the discourses than in the narrative parts of the Gospels, most of all apparent in the spoken words of our Lord. At the same time, there are certain portions of narrative of great importance, that shew in the several evangelists almost a verbal coincidence, as in the call of the first four disciples and the accounts of the Transfiguration. "The agreement in the narrative portions of the Gospels begins with the baptism of John, and reaches its highest point in the account of the passion of our Lord, and the facts that preceded it; so that a direct ratio might be laid between the amount of agreement and the nearness of the facts related to the Passion. After this event, in the account of his burial and resurrection, the coincidences are few." There are no parts that furnish more difficulty, in the way of formal harmony, than the narratives of the Resurrection.

The language of all the Gospels is well known to be Greek with Hebrew idioms, or what has been called Hellenistic Greek. The tradition, however, of a Hebrew original of St Matthew's gospel is uniform. In the fragment of Papias, and in the statement of Irenæus—the earliest sources in which we have any distinct mention of the Gospels—it is plainly asserted that Matthew wrote his Gospel in the Hebrew dialect. The fact is made a mark of distinction between his Gospel and the others. The same uniformity of tradition ascribes the Gospel of St Mark to the teaching of St Peter. The Gospel of St Mark is the most summary of the three, yet, in some respects, it is stamped with a special individuality and originality. It describes scenes and acts of our Lord and others with a minutely graphic detail, throwing in particulars omitted by others, and revealing throughout the observant eye-witness and independent historian.

3. *The Origin of the Gospels.*—This is a separate inquiry from their genuineness, although intimately connected with it, and springs immediately out of those facts as to the internal agreement and disagreement of the Gospels of which we have been speaking. The inquiry has been treated in an extremely technical manner by many critics, and it would not suit our purpose to enumerate and examine the various theories which have been propounded on the subject. We may only state generally, that the object of these theories has been to find a common original for the Gospels. Some profess to find such an original in one of the three Gospels, from which the others have been more or less copied, and each of them in turn has been taken as the basis of the other two. The more elaborate theories of Eichhorn and Bishop Marsh, however, presume an original document, differing from any of the existing Gospels, and which is supposed to pass through various modifications, into the threefold form which it now bears in them. It appeared to Eichhorn that the portions which are common to all the three Gospels were contained in a certain common document from which they all drew. It had been already assumed that copies of such a document had got into circulation, and had been altered and annotated by different hands. But Eichhorn works out an elaborate hypothesis on such a presumption. He requires for his purpose no fewer than five supposititious documents. The conditions of the problem cannot be met otherwise. These are in order: 1. An original document; 2. An altered copy which St Matthew used; 3. An altered copy which St Luke used; 4. A third copy made from the two preceding, used by St Mark; 5. A fourth altered copy used by St Matthew and St Luke in common. Bishop Marsh, in following out the same process of construction, finds it necessary to increase the supposititious documents to eight, which we need not describe. There is not the slightest external evidence of the existence of such documents; and theories of this kind, which, in order to explain difficulties, call into existence at every stage an imaginary solution, do not require serious refutation.

Another and more probable supposition is, that the Gospels sprang out of a common oral tradition. The preaching of the apostles was necessarily, to a great extent, a preaching of facts; and so zealously did they give themselves to the task of promulgating the wondrous life and death of Christ, that they early divested themselves of the labor of ministering to any of the lower wants of the congregations of disciples that they gradually gathered round them. It is obvious that, in the course of their active "ministry of the word," the facts of our Lord's life and death, of which they had been eye-witnesses, would gradually assume a regular outline. What the reading of the Gospels is to us, the preaching of the apostles would be very much

Digitized by Google

to the early Christians. The sermon of Peter at Cæsarea (Acts x. 34) may give some imperfect idea of the character of this preaching. The facts thus briefly indicated would expand in frequent communication to something of the more detached and living form which they exhibit in the Gospels, or rather in what we may suppose to have been the common substratum or ground-work of the Gospels. It is to be remembered that the apostles were promised that the Holy Spirit would "bring all things to their remembrance, whatsoever the Lord had said unto them." And this constant guidance and superintendence of the Divine Spirit would sufficiently account for the uniformity and consistency of their oral instruction, even although not reduced to writing for a considerable number of years. Allowing for the widest space of years it may be necessary to assume before the writing of the first Gospel, the chief apostles themselves are yet living at the end of this space. It is not a mere tradition of their teaching that survives, but it is their own living witness that is circulated from church to church, as they pass to and fro in their evangelistic labors.

It is impossible to say whether this hypothesis of the origin of the Gospels be really the correct one or not; all we need to say is, that it seems to possess more probability in itself than any hypothesis of a common written source, from which they were respectively borrowed, and which has disappeared. It fits, moreover, into the facts of the case.—Westcott, "Introduction to the Study of the Gospels," p. 189.

According to this view of the origin of the Gospels, that of St Mark, if not the oldest in composition, is yet probably the most direct and primitive in form. In its lifelike simplicity and comparative unconsciousness of aim, it represents most immediately the apostolic preaching; it is the testimony delivered by St Peter, possibly with little adaptation. Historical evidence, as we have already said, is uniform as to the association of Mark and Peter: Mark is everywhere *interpres Petri*. The Gospels of St Matthew and St Luke, again, "represent the two great types of recension to which it may be supposed that the simple narrative was subjected. St Luke represents the Hellenic, and St Matthew the later Hebraic form of the tradition, and in its present shape the latter seems to give the last authentic record of the primitive Gospel."

A common oral Gospel seems also to present the most natural explanation of the accordances and variations of the three Synoptic Gospels. The words of the Lord, which present in all such a marked uniformity, would necessarily assume a more fixed character in such an oral tradition, while the narrative surrounding them would remain comparatively free. Single phrases of a peculiar and important character would be closely retained; there would be, exactly as we find, a uniform strain of hallowed language mingling with variations in detail—a unity of tone, and even of speech, with variety of modulation and emphasis.

The development of the famous Tübingen theory of the origin of the Gospels, by F. C. Baur (q. v.), marked an important epoch in critical study. He sought the cause of the differences between the several Gospels, not in vague myths or the fantasy of individuals, but in the dominant spiritual tendencies of the apostolic age. He gave greater scope to the influence of such tendencies by adopting the view that the latest of the Gospels, John's, was not written till about 170 A.D. The most characteristic thought of Baur's criticism was that the Gospel of John is not a historical record, but a designedly dogmatical work in which the historical element is but the transparent envelope of the theological truths, and is used as the artistic setting for a body of profound religious thought. The three synoptic Gospels, of which Baur assumed Matthew's to be the earliest, are much freer from dogmatic presupposition, though in Matthew a Judaical, and in Luke a Pauline influence is traceable.

Since Baur's time, all critics are either his supporters or his opponents. The literature is most voluminous. The chief recent names are Bleek, Weisse, Ewald (against Baur), Weizsäcker, Hilgenfeld, Holtzmann, and Keim. The orthodox view is well represented by Westcott's "Introduction to the Study of the Gospels," and Tischendorf's "Wann wurden unsere Evangelien verfasst?" (Eng. trans. 1867).

GO'SPORT ("God's port"), a market-town and seaport of England, in the county of Hants, stands on the western shore of Portsmouth Harbor, and directly opposite Portsmouth, with which it is connected by a floating bridge. It is 14 miles south-

Digitized by Google

east of Southampton, and 69 miles south-west of London by the London and South-Western Railway. It is enclosed within ramparts, which seem a portion of those which also surround Portsmouth and Portsea. The Haslar Gun-boat Ship-yard, connected with the town, is used for hauling up and keeping in repair all the gun-boats belonging to this port. An extensive iron foundry for the manufacture of anchors and chain-cables, and considerable coasting-trade are here carried on. The main feature of G., however, is the *Royal Clarence Victualling Yard*, which contains a brewery, a biscuit-baking establishment worked entirely by steam, and numerous storehouses. The bakery can turn out ten tons of biscuit in one hour. In the immediate vicinity is Haslar Hospital, erected in 1762, the chief establishment in Great Britain for invalid sailors, of whom 2000 can be accommodated and supplied with medical attendance. Pop. (1871) 7366.

GOSSAMER, a light filamentous substance, which often fills the atmosphere to a remarkable degree during fine weather in the latter part of autumn, or is spread over the whole face of the ground, stretching from leaf to leaf, and from plant to plant, loaded with entangled dew-drops, which glisten and sparkle in the sunshine. Various opinions were formerly entertained concerning the nature and origin of gossamer, but it is now sufficiently ascertained to be produced by small spiders, not, however, by any single species, but by several, not improbably many, species; whilst it is also said to be produced by young, and not by mature spiders, a circumstance which, if placed beyond doubt, would help to account for its appearance at a particular season of the year. The production of gossamer by spiders was first demonstrated by the observations of Dr Hulse and Dr Lister in the 17th c., but these observations did not for a long time meet with due regard and credit, particularly amongst the naturalists of continental Europe. It is not yet well known if the gossamer spread over the surface of the earth is produced by the same species of spider which produce that seen floating in the air, or falling as if from the clouds. Why gossamer threads or webs are produced by the spiders at all, is also a question not very easily answered. That they are meant merely for entangling insect prey, does not seem probable; the extreme eagerness which some of the small spiders known to produce them shew for water to drink, has led to the supposition, that the dew-drops which collect on them may be one of the objects of the formation of those on the surface of the ground, whilst it has been also supposed that they may afford a more rapid and convenient mode of transit from place to place than the employment of the legs of the animal. As to the gossamers in the air, conjecture is still more at a loss. They are certainly not accidentally wafted up from the ground, as might be supposed; the spiders which produce them are wafted up along with them; but whether for the mere enjoyment of an aërial excursion, or in order to shift from place to place, is not clear, although the latter supposition is, on the whole, the most probable. The threads of gossamer are so delicate that a single one cannot be seen unless the sun shines on it; but being driven about by the wind they often become beaten together into thicker threads and flakes. They are often to be felt on the face when they are scarcely visible. The spiders which produce these threads shoot them out from their spinnerets, a viscid fluid being ejected with great force, which presently becomes a thread; sometimes several such threads are produced at once in a radiating form, and these being caught by the ascending current of heated air, are borne up, and the spider along with them. It has been said that the spider has even some power of guiding in the air the web by which it is wafted up.

GOSSELIES, a town of Belgium, in the province of Hainaut, four miles north-by-west from Charlerol, and on the canal from Charlerol to Brussels. It has manufactures of woollen cloth, hats, nails, cutlery, soap, &c.; also bleach-fields and tanneries. There are coal-mines in the vicinity. Pop. (1870) about 7000.

GOSSYPIUM. See COTTON.

GOTHA, a town of Germany, capital of the duchy of Saxe-Coburg-Gotha, is situated on an elevation in a beautiful district on the right bank of the Leine, 18 miles west of Erfurt, by the Thuringian Railway. It is a handsome, well-built town, is quadrilateral in form, and was formerly surrounded by walls, which, however, have been thrown down, and public walks laid out in their place. The principal public building is the large ducal palace of Friedenstein, with two large side-wings,

Digitized by Google

and two towers of 144 feet in height. This palace contains a picture-gallery, in which Cranach, V. Eyck, Holbein, Rubens, and Rembrandt are represented; a cabinet of engravings (a very valuable collection); a library (founded by Ernst the Pious in 1640) of 170,000 volumes and 6000 manuscripts (2000 Arabic); a cabinet of Egyptian, Roman, Greek, and German antiquities; a collection of about 80,000 coins and 13,000 medals, one of the finest collections in Europe; and a Japanese and Chinese museum. G. has also an arsenal, a new and old town-hall, and numerous educational and benevolent institutions. The principal manufactures are porcelain, colored paper, cloth, tobacco, sugar, toys, machinery, musical and surgical instruments, &c. Gotha sausages have a widespread celebrity. Several hundreds of designers, engravers, printers, and colorers of maps are employed here in Justus Perthes's large geographical establishment. Pop. (1875) 22,928.

GOTHA, Almanach de, a universal political register, is published annually at Gotha (q. v.). The publication of this almanac commenced in 1764, in the German language, in which it was continued until Napoleon I. became emperor, when it was changed to the French language; it has recently been published in both tongues. The almanac is a small pocket volume, containing at present nearly one thousand pages of small type, and recording the sovereigns and royal families of every civilised country, with the civil, diplomatic, military and naval officers, a great amount of statistical information, a compact summary of historical events, obituary notices of the most distinguished persons, and other matters of political interest. No book ever printed contains so much political and statistical information in so small a compass. The boundaries of states are given according to the latest treaties, with their extent, population and revenues. The "annuaire diplomatique" contains the name of every diplomatic representative and *attaché* of Europe and America. The pay of officers of governments, national expenditures and debts, with the interest, the number of representatives, under representative governments, and their proportion to the population, are carefully given. As a work of such an extent cannot be brought down to the end of the year, the date of publication is stated, and in some instances a date has been given to each page, as completed, to shew that the editor is not answerable for subsequent changes. When the "Almanach de G." was commenced there was but one republic in existence—that of Switzerland. It was then little more than a register of the crowned heads and royal families of Europe. It has been slow to recognize political changes, and for years after the French Revolution continued to print under the head of "France," Louis XVII. as the reigning monarch. It was not until Napoleon became emperor that his name found a place in its pages, and then his whole family was given, as with the other royal houses. During the Empire, Napoleon I. considered this little publication so important that he exercised over it a rigid supervision, and in 1808, an entire edition which had just been worked off, was seized because Anhalt took precedence of Napoleon. To secure this rearrangement of the alphabet, the edition of that year was printed at Paris. It is probable that a similar supervision of the press kept out of the historic pages the successes of the allies against the Empire in the succeeding numbers, in which there was no mention of the campaigns of the Peninsula and the victory of Trafalgar. On the restoration of the Bourbons, however, these events were recorded in a *resumé*.

GOTHA, Duchy of. See SAXE-COBURG-GOTHA.

GOTHARD, St, a mountain group in the Helvetian Alps, reaches in its highest peaks the height of 12,000 feet. See ALPS. St G., however, is chiefly famous for the pass over the Alps, which at its summit rises to the height of 6800 feet. By means of this pass, the high-road from Flnelen, on Lake Lucerne, is carried without interruption in a south-south-east direction to Lago Maggiore, in the north of Italy. The road over the pass, made between 1820 and 1832, was destroyed throughout a great part of its length by violent storms in 1834 and 1839. Since that time, however, it has been in a good state of repair. It is one of the best and most convenient of the Alpine carriage-ways, is free from snow for four or five months of the year, and is remarkable for the grandeur of its scenery. In 1870 Germany, Italy, and Switzerland signed an agreement for the construction of a railway with a tunnel through the St Gothard. The chief difficulty in the way of apportioning the expense was removed in 1879, when the Swiss confederation agreed to bear part of the burden along with the several Swiss cantons through which the line passes,

Digitized by Google

and the two Swiss railways. The total cost is estimated at something over £9,000,000. At the beginning of 1879, more than 7½ miles (the total length of the Cenis Tunnel) had already been bored, leaving less than 3000 yards to accomplish. The tunnel is to be open for traffic in 1880.

GOTHENBURG. See GOTTENBORG.

GOTHIC ARCHITECTURE. Under this title are comprised the various styles of architecture which prevailed in Western Europe from the middle of the 12th c. to the revival of classic architecture in the 16th century. The term *Gothic* was at first bestowed by the Renaissance architects on the mediæval styles as a term of reproach. This epithet they applied to every kind of mediæval art which had existed from the decline of the classic styles till their revival, all other styles being by them considered as *barbarous* and *Gothic*. The name has now, however, become generally adopted, and has out-lived the reproach at first implied in it. It has also become limited and defined in its application. During the present century, the arts of the middle ages have been attentively studied, and their origin and history carefully traced; and as the knowledge of these styles has increased, a feeling of admiration has succeeded to that of contempt, and Gothic now ranks as one of the noblest and completest styles of architecture ever invented.

Origin.—The origin of Gothic architecture has given rise to many very ingenious speculations. It has been said that the style was copied directly from nature; that the pointed arches and groins of the vaults were imitated from the overarching branches of trees; and that the stems of an avenue were the originals of the pillars of the Gothic aisles. Others have strenuously maintained that the invention of the pointed arch was a mere accident, arising from this form having been observed in the interlacing of the circular arches of a Norman arcade. It has also been stated that the style was imported from the East during the Crusades, and that the mediæval architects had but little to do with its origin.

More careful study of the Gothic buildings which remain to us, has dispelled these fanciful ideas, and settled the origin and progress of the art on historical as well as internal evidence.

To trace Gothic up to its primary elements, we should have to go far back in the world's history. Some maintain that there are only two styles of architecture of which we have any knowledge—viz., Greek architecture and Gothic architecture; that these are the two typical styles, and that in them are contained all the elements of which all other styles are composed.

This is no doubt to some extent true, just as it is also true that all things in nature are derived from a few primary elements. But as there are many varieties in nature, so there are many developments of the two typical forms of architecture, all of which deserve to be classed as styles.

Greek architecture is the type of the trabeated style—i. e., the style whose principal feature is the straight lintel; Gothic is the type of arcuated architecture, in which the voids are spanned by arches. Of these typical forms there are many varieties. Roman Architecture (q. v.) is the transition form between them. The Romans adopted the Greek form of decoration and the Gothic form of construction; they decorated their exteriors with columns crowned by straight architraves and cornices, and inside these they formed the real construction with arches and vaults. The use of the latter gradually extended, especially in the construction of interiors, and by means of vaults the Romans were able to roof in large areas without encumbering the floor with pillars. This was found to be a very advantageous system of construction, and was carried out in many important examples, as, for instance, in the Baths of Caracalla and Diocletian (see BATHS), the Basilica of Constantine, &c. In their works of public utility, where use, not decoration, was the chief object, the Romans always adopted the arch as the fittest mode of construction—as in their aqueducts (q. v.) bridges, &c. The arch thus came gradually more and more in use; and about the time when the barbarians first overran the provinces, the arcuated form of construction was universal, and some attempts had been made to conform the Greek decoration to the circular arches by bending the entablature round the curve—as in the palace of Diocletian at Spalato, in Dalmatia.

To the Romans, therefore, is due the introduction of an arcuated construction with a well developed internal, and a partially developed external decoration. The

Digitized by Google

early Christians adopted their forms of construction and decoration from the Romans. They were also indebted to them for the plans of the buildings, which became the types of the Christian sacred edifices during the middle ages. The Basilica (q. v.), or Roman court-house and market-place, was found to be admirably adapted for early Christian worship, and the circular temples were the prototypes of the Christian Baptisteries (q. v.) which usually accompanied the basilicas. In erecting their buildings, the Christians not only adopted the plans and mode of construction, but used the actual materials of the buildings of the Romans, many of which had been destroyed by the barbarians. Where such materials were abundant—as in Rome and Central Italy—the early Christian architecture very closely resembled that of the Roman buildings which had preceded it. But in more remote districts the builders, finding no ready-made materials at hand, had to design and prepare new ones. In doing so they followed as closely as they could the Roman originals, but their buildings partook more of the constructional than the decorative elements of Roman architecture. The Roman ornament thus dropped out of use; and when, in process of time, decoration was desired, each new people followed its own ideas. The traditional Roman decoration thus became to a great extent lost, and new styles introduced. These new styles each retained some of the original Roman forms and modes of construction; and each style depended for its peculiar character on the particular Roman forms it retained and developed. Thus Constantine, and the architects of the East, seized upon the *dome* as the distinguishing feature of their style, and the architects of Lombardy adopted the plain tunnel-vault. The former style is called Byzantine (q. v.), and has been the type of all Eastern medieval architecture; and the latter Romanesque (q. v.), and has been the origin of all the western architecture of medieval Europe.

History.—From Lombardy—in those ages part of the German Empire—the Romanesque style readily passed into Germany and Switzerland, and was also most naturally adopted in the South of France, where examples of Roman architecture abounded. This architecture was carried out with various modifications in these different countries, all of which may have contributed to the general progress of the art; but as might be expected, it is to the banks of the Rhine, where the successors of Charlemagne chiefly dwelt, that we must look for the first step in the development of Gothic architecture. The following short sketch of the development of vaulting will shew how this occurred.

The Roman basilicas, and, like them, the early Christian Churches, were divided into a central nave with two side-aisles, the former separated from the latter by a row of columns on each side. These columns carried arches on which rested the side walls of the nave, which were carried sufficiently high to clear the roofs of the side-aisles, and admit windows to light the central nave. The row of windows afterwards became the Gothic Clerestory (q. v.). The apse at the end of the nave was semicircular on plan, and was usually roofed with a vault in the form of a semi-dome. This feature was also afterwards more fully developed in the chapels of Gothic churches. The nave and side-aisles were originally roofed with wood, but, owing to their frequent destruction by fire, it became necessary to cover the churches with a more enduring kind of construction. Vaulting was then introduced, the Roman forms, of which many examples existed, being at first closely followed. To trace the progress of vaulting from the simple tunnel-vault of the Romans to the fully developed and magnificent groins of Gothic cathedrals, is a most interesting inquiry; and, indeed, includes the history of the development of Gothic architecture. There is one consideration which will help to explain how the Roman arches were abandoned and new forms sought out. To the Roman emperors who built the splendid vaults of the baths, and who had a subdued world at command, *materials* and *labor* were a small consideration. They could, therefore, afford to build in a new style which required perfect materials and workmanship. But medieval princes and bishops could obtain neither, except with great cost and trouble; to economise these, therefore, great skill and attention were required. It was necessary to study to avoid those large and expensive materials of which the Romans were so lavish, and to adopt the simplest and easiest forms of construction.

The first vaults tried were simple semicircular tunnel-vaults. It was found that these, besides being very gloomy, required very massive walls to resist their thrust. An attempt was then made to relieve this thrust by *transverse arches* thrown across

Digitized by Google

—at intervals—under the tunnel-vault, to act as strengthening arches. Buttresses with a slight projection were applied outside to support these, and a beam of wood was sometimes introduced at the wall-head from buttress to buttress to assist in opposing the thrust of the vault.

This was the first attempt to throw the weight of the vault on single points. In the side-aisles, where the span was small, the Roman intersecting vaults were used; and as the roofs with tunnel-vaulting were found very gloomy and ill-lighted, it was desirable that similar intersecting vaults should be used to cover the main roof, in order to admit windows raised to light the vaulting. But how was this to be managed with the small materials at command? If the transverse arches are semicircular, and the side-arches the same—the vault being formed by two intersecting cylinders—then the intersecting groins must be elliptical. This was a difficult form of construction; the medieval builders found it easier to construct semicircular groin arches with radius, and to fill in the triangular spaces with slightly domed vaults. Here, then, we have the origin of the groin-rib, the development of which played so important a part in Gothic vaulting. When the space to be covered was square, this form of vault was found to answer, and usually included two bays of the side-aisles. But this arrangement looked awkward externally, the windows of the clere-story not grouping well with those of the side aisles. A transverse arch was then introduced, carrying up the design from the nave piers to the vaulting. This form of vault is called hexapartite. All the above forms of vaulting were fully developed in the round arched styles of the Rhine.

In France, these forms were also tried; but it was found that the semicircle is not a good form of arch unless loaded on the haunches, many of the churches which were vaulted in this manner during the 11th c. having to be buttressed or rebuilt in the 12th and 13th centuries. In the south of France (where the Byzantine influence had been strongly felt, through the Mediterranean commerce), the pointed tunnel-vault had been long in use, and had superseded the semicircular tunnel-vault probably as early as the 9th or 10th century. This form of arch was thus probably suggested to the architects of the north of France, who at once saw how well it would overcome the difficulty of the yielding of the haunches in the semicircular arch. They were thus led to the adoption of the pointed form for their transverse arches *as a structural expedient*, and still retained the semicircular form in the groins. The next question which engaged attention, and the solution of which led to the further use of the pointed arch, was the vaulting of oblong spaces. This had been tried with semicircular arches, but it was found that in this way the vault would require to be very much domed—the diameter of the arches being so much smaller—whereas by using pointed arches, of different radii, for the transverse and side arches all might be kept to about the same height. By the introduction of this new form of arch the vaulting was strengthened, and the thrust brought to bear steadily on single points. We have thus traced the history of vaulting from the time of the Romans to the 12th c., when the principles of Gothic pointed vaulting were fully developed; and we have dwelt particularly on this subject, because it includes the principles which regulated the whole of the Gothic style. Gothic was not the invention of an individual, but a necessary growth—a gradual development from structural requirement. This is clearly the case with regard to the vaulting, as we have traced it above, and the same might be proved regarding every member of the style. Thus it might be shewn how the ribs became gradually more decided, expressing the part they bore in the support of the roof; how the Nave Piers (q. v.) were gradually subdivided into parts, each shaft bearing on a separate cap a separate portion of the vaulting; how the buttresses were developed as they were required to resist the thrust of the groins concentrated on points; and how the flying buttresses were forced upon the Gothic architects much against their will, as a mode of supporting the arches of the roof.

The history of the latter is very curious. The thrust of the tunnel-vault was sometimes resisted by half-tunnel-vaults over the side aisles. These, therefore, required to be high, and a gallery was usually introduced. In the Narthex at Vezelay we have this gallery with the vaulting used as a counterpoise to that of the nave. This is a fine example of vaulting in the transition state, the vaulting of the gallery resists the main vault, and is at the same time groined. This leaves rather a weak point opposite the transverse arches, and to strengthen these, flying buttresses are

Digitized by Google

introduced, which timidly shew themselves above the roof. The galleries were, in later examples, dispensed with to admit of larger clerestory windows, and the flying buttresses were left standing free. The architects finding them indispensable, then turned their attention to render them ornamental. *Pinnacles* may also be shewn to owe their origin to their use; they acted as weights to steady the buttresses and piers. We shall, under their separate heads, point out how each element of Gothic architecture was in the strictest sense constructional, the decoration being in harmony with its actual use, or as Pugin has said, "decorated construction, not constructed decoration."

The full development of Gothic vaulting, which was the forerunner of the whole style, was first carried out in the royal domain in France about the middle of the 12th century. The Normans had settled in the north of France more than a century before this, and had applied their talents and the fruit of their conquests to the building of splendid temples in honor of their victories. In doing so, they followed out the round-arched style, and brought it forward by a great stride towards true Gothic. See NORMAN ARCHITECTURE.

South of the royal domain, in Burgundy, there had existed for centuries great establishments of monks, famous for their architecture. The Abbey of Cluny was their central seat, whence they sent out colonies, and built abbeys after the model of the parent one. The style in which they worked was also an advanced Romanesque, but different from that of the Normans.

Between these two provinces lay the royal domain. Owing to the weak state of the kingdom, architecture had hitherto made little progress in the Isle of France. About the beginning of the 12th c. the monarchy revived, and for the next two centuries was governed by wise and powerful monarchs, who succeeded in re-establishing the royal supremacy. A new impulse was thus given to the literature and arts of the country, by which architecture profited largely. From the state of ruin into which the kingdom had fallen, there were almost no churches existing worthy of the new state of things. New and great designs were formed: hitherto, almost all the important churches of France were abbey churches; now, under the royal patronage, cathedrals were to be built. The bishops, envious of the power of the monks, lent their powerful aid, and the whole of the laity joined heartily in the work. With such a universal impulse, no wonder that architecture took a great stride, and new forms were introduced. It is to this period and people that we owe the development of the true or pointed Gothic style.

We have already seen at Vezelay how nearly the Burgundian monks had approached to Gothic. To complete the development, it only required the side-walls and vaulting of the nave to be raised, so as to admit of windows over the roofs of the side-galleries; and the flying buttresses to be raised with them, so as to receive the thrust of the vault—the latter being constructed with pointed groin ribs, and the side and transverse arches carried to the height of the groins. The laic architects of the royal domain soon accomplished this step, and the new style sprung up and progressed with the most astonishing rapidity.

The earliest example we have of the fully developed Gothic style is the Cathedral of St Denis, in which are deposited the remains of the kings of France. It was founded by the Abbé Suger in 1144. The Cathedral of Notre Dame of Paris soon followed, and almost contemporary with it arose the magnificent cathedrals of Chartres, Rheims, Amiens, Beauvais, Bourges, and a host of others.

Another cause which tended much to hasten the progress of the style, was the invention about the same time of painted glass. The Romanesque architects had been in the habit of decorating their churches with frescoes and other paintings; but this new mode of introducing the most brilliant colors into their designs was at once seized upon by the northern architects. The small circular-arched windows, which were still in many instances retained long after the pointed-arch had become usual in the vaulting, no longer sufficed to light the churches when filled with stained glass. They were therefore enlarged, two or even three were thrown into one, divided only by mullions; this compound window was again increased until the compartment of the clerestory became almost wholly absorbed. The architects were then forced to conform the arches of their windows to the pointed outline of the side-arches of the vaulting. This desire for more and more space for stained glass was the origin of the window-tracery, which forms so beautiful a feature of the

Digitized by Google

style. It is the last attenuated remains of the wall space of the clerestory, which was at last entirely absorbed.

Notre Dame is a good illustration of the progress of French Gothic. The clerestory windows are small; and, in order to give more light, the vault of the gallery next the window is kept very high. This was the original design; but during the construction of the cathedral, the importance of stained glass had become so great, that the design was altered to give larger windows for its display, as shewn on the right-hand portion of the elevation. These windows also shew the simple early forms of tracery; that in the aisle windows being later and more advanced. Tournay Cathedral is a good specimen of the mode in which the whole space of the side-walls was made available for window tracery and stained glass.

The further history of Gothic architecture in France is simply the following out, to their furthest limits, of the principles above indicated, on which the early architects had unconsciously been working when they originated the style. So long as the Gothic architects worked on these principles, they advanced and improved their architecture. When, however, the style had become fully developed and matured (about 1300 A.D.), the spirit of progress died. No new features were developed. The architects seemed to think that in its main elements their style was complete, and contented themselves with continuing the traditional style of their forerunners, pushing to their extremest limits the principles handed down to them. Thus, the height of the cathedrals was extended till, at Beauvais, it exceeded the power of the architects to prop up the vaulting. The system of buttresses and pinnacles was developed with the utmost skill, till at last the original simplicity and repose of the designs were lost, and the exteriors presented an elaborate system of scaffolding and propping-up in stone. The beautiful forms of the early tracery became distorted into all manner of flowing curves, graceful but unmeaning, of the Flamboyant period (q. v.); and, in short, the art became lost in mere cleverness of design and dexterity of execution, and the architect's place was usurped by the freemason.

It is in the cathedrals of the 12th and 13th centuries, above referred to, that we find the noblest development of the Gothic style. Everything tended to make them so. The nation was united in the effort—all the science, all the arts, all the learning of the times were centred in the church. In it, and that almost exclusively, the sculptor, the painter, the historian, the moralist, and the divine, all found scope for the expression of their ideas on the sculptured walls, porches, and niches, or the painted windows of the cathedrals—the churches of the people.

The progress of this style in other countries is no less remarkable. At no time in the world's history did any style of architecture ever spread so wide, or give rise, in so short a time, to so many splendid buildings. No sooner had the style been invented in the central provinces of France, than it immediately spread over the whole of the west of Europe, superseding all other styles, and producing similar splendid buildings wherever it went.

We will note shortly a few of the peculiarities of the style in England, Germany, and Italy. It spread also over the south of France and Spain; but the latter countries have not yet been fully illustrated.

English Gothic.—The Normans introduced their round-arched style at the Conquest in 1066, and there are some fine specimens of this style both in England and Scotland—St Cross, Hampshire; Durham Cathedral; Kelso and Jedburgh Abbeys, &c. But these buildings are not copies of those of Normandy. The English have always, in adopting styles, given them a national impress. As it was with the Norman, so it was to a still greater degree with the pointed Gothic. This was introduced into England about 1174, by William of Sens, who superintended the rebuilding of Canterbury Cathedral. The English architects soon began to follow out a pointed style of their own. They borrowed much from France, and worked it out in their own way, forming what is now called the *Early English* style. The differences between the early Gothic of France and England extend to almost every detail. The mouldings, bases, caps, pinnacles, buttresses, and foliage of the latter are all impressed with the early English feeling. In France, the feeling of the early Gothic is one of unrest—a constant struggle forward. In England, the effort for progress is not so marked—that of carefulness and completeness prevails. The termination of a French cathedral or church is invariably circular ended or apsidal—a form derived from the circular tomb-house or baptistery, which in early Christian

Digitized by Google

times was built separately, and afterwards taken into the cathedral. The English cathedral, on the contrary, is almost always square ended. The French transepts have almost no projection; the English ones have great projections—Salisbury and Canterbury having *two* transepts. The French cathedrals are short and very lofty; the English, long and comparatively low. The French buildings are perhaps the grandest and most aspiring, the English the most finished and picturesque.

The exterior of the chevet was a difficulty with the French and Germans, and, as at Beauvais and Cologne, resembles an intricate and confused mass of scaffolding. This difficulty was avoided by the English square ends, which afforded scope for the very English arrangement of the "Five Sisters" at York, or for a large field of stained glass in a single window.

The western portals of the French cathedrals, such as Rheims and Amiens, are among the boldest and most magnificent features of their architecture. In these the English were not far behind, as the western portals of Peterborough and York shew.

The outlines of the English cathedrals are usually very picturesque and well balanced, the western towers grouping harmoniously with the central, and in this respect the English have the advantage.

In the application of vaulting, the English carried out their own ideas. They were always fond of wooden roofs, and probably this may have led to the invention of the many beautiful kinds of vaults which form so fine a feature of English Gothic (see VAULTING, FAN-TRACERY). In England the style lasted longer than on the continent.

The Germans were nearly a century in adopting the pointed style after its invention in France; and when it was introduced, it retained the appearance of a foreign importation. It never was so completely naturalised as in England. The so-called beauties of the German Gothic are, for the most part, to be regarded rather as excellent specimens of masonry than as artistic developments of the style. The open-work spires, for example, are fine pieces of construction, and have a striking effect; but from the first there is a tendency to commit the work to masons, who rejoice in displaying their manual dexterity. The later Gothic in Germany is the most splendid development of the stone-cutter's art and the draughtsman's ingenuity; these run riot, while the artist is entirely awanting.

The Gothic style forced its way also into classic Italy, but there it was never understood nor practised in its true spirit. It was evidently an imitation from the beginning. The Italian architects tried to vie with those of the north in the size of their buildings, some of which, as San Petronio at Bologna, and Milan Cathedral, are enormous. The former illustrates the defects of Italian Gothic. The arches are very wide, and there are few piers. There is therefore a bare and naked effect, which is not compensated for by any richness of sculpture or color. There is a want of *scale* about Italian Gothic buildings, as there is about those of Italian classic architecture, both ancient and modern. Size alone is depended on for producing grandeur of effect. There is no attempt made to mark the size, and give a scale by which to judge of the dimensions of the buildings in those styles. A large classic temple is simply a small one magnified. In true Gothic architecture the case is different. Not only are the general dimensions magnified in a large edifice, but also the parts are multiplied. The columns and shafts remain of the same size, but their number is increased. The arches are enlarged in proportion to the general dimensions, but the caps, bases, and mouldings remain of the same size as in a smaller building, and thus indicate the greater size of the arch. A true Gothic building of large dimensions thus tells its own greatness, but in a classic or Italian Gothic edifice the size has to be found out. Stained glass was little used in Italy. It may have been intended to decorate the walls with frescoes—as indeed is the case in a few examples. The Church of St Francis, at Assisi, is the most remarkable building of this kind, and is a most interesting example of fresco-decoration.

The towns of Italy, being early enfranchised, have many municipal buildings in the Gothic style. These will be treated along with those of Belgium hereafter. See MUNICIPAL ARCHITECTURE.

We might, in the same manner, trace the Gothic style in all the other countries of Western Europe; but its history is similar in all. It is in England and France that the true spirit of the style was most felt, and the finest examples remain. Our

Digitized by Google

space has not permitted us to enter minutely into the various styles of Gothic in each country. The more important of these will be treated separately. See EARLY ENGLISH, DECORATED, PERPENDICULAR, FLAMBOYANT.

We may, however, state generally, that both in France and England the style had a complete existence—it was born, arrived at maturity, and died. When the spirit of the early architects had pushed the design to its utmost limits, they rested from their labors, well satisfied with their splendid achievements. Their successors occupied themselves with forms and details, and with the perfecting of every minute part. The art finally passed away, and left architecture in the hands of trade corporations—masons, carpenters, plumbers, &c.—who monopolised the whole work, and acted independently to the exclusion of one directing mind. The result was as we have seen; architecture became masonic skill, and Gothic was finally superseded by the revival of classic architecture in the 16th century.

GO'THLAND (Swed. *Gottland*), an island in the Baltic, lying between 57°—58° n. lat., and 18°—19° 30′ e. long., which, with Farōe, Gotska, Sandōe, and other smaller islands, constitutes the Swedish læn or province of Gottland and Wisby. Pop. (1876) 54,649; and the superficial area about 1200 square miles. Chief town, Wisby (q. v.). G. consists mainly of terrace-like slopes of limestone formation, encircled by cliffs which are broken by numerous deep fiords, more especially on the west coasts of the island, the eastern parts of which are flat. The surface is in many parts hilly and well-wooded, and the soil is fruitful and well cultivated. The climate is sufficiently mild to allow of the grape and mulberry ripening in favorable situations in the open air. The land is divided among many small proprietors, who live in separate and detached homesteads. The island of G. was for ten years (from 1439 to 1449) the self-elected place of banishment of King Eric X., who, after long-continued dissensions with his Swedish and Danish subjects, retired to Wisby, where he shut himself up in the castle with his favorite mistress and a band of followers. Having refused to resume his duties, he was declared to have forfeited the crowns of Sweden and Denmark, and thenceforward he subsisted by pillaging the ships and infesting the coasts of the lands he had formerly governed. The remains of numerous churches and monasteries in every part of the island attest its former wealth, and afford many noble specimens of Gothic architecture.—The name G. or Gotland (q. v.) is also used to indicate the southern division of the kingdom of Sweden, including 11 provinces besides the island of Gothland.

GOTHS (Lat. *Gothi, Gothones, Guttones, Gutæ*, &c.; Gr. *Gotthoi, Gottoi, Goutthoi, Guthōnes*; Gothic, *Gutthiuda*), the name of a powerful nation of antiquity, belonging to the Germanic race. By some writers they are thought to have had a Scandinavian origin, which was the belief of their own historian, Jornandes. Indeed, Jornandes Procopius, Capitolinus, and Trebellius Pollio identified them with the Getæ, a branch of the Thracian group of nations; but later researches, especially those of Dr Latham, leave it almost without a doubt that the G. were originally Germans. The earliest notice of them extant among the writers of antiquity is that of Pytheas of Marseille, who lived about the time of Alexander the Great, and wrote a book of travels, some fragments of which have been preserved in the works of other writers. In one of these fragments, we find mention made of a tribe of *Guttones* bordering upon the Germans, and who lived round a gulf of the sea called Mentonomon, a day's sail from the island of Abalus, where they used to gather amber, and sell it to the neighboring Teutones. This gulf, there is every reason to believe, was the *Frieches Haff*, situated on the Prussian shore of the Baltic. The next notice that occurs of the G. is in the "Germania" of Tacitus, in which they are called Gothones, and are represented as dwelling beyond the Lygii; in the same direction, that is, as the one pointed out by Pytheas, though not on the sea-coast. Tacitus also distinguishes them from the Gothini, a tribe east of the Quadi and Marcomanni, and who are represented by him as using the Gallican tongue. The Gothones, according to this historian, were under regal government, and on that account not quite so free as the other tribes of Germany, but still they enjoyed a considerable amount of liberty. The tribes next beyond them, and dwelling immediately on the sea-coast, were the Rugii and Lemovii, whose form of government was also monarchical, and their weapons, like those of the Gothones, round shields and short swords.

Digitized by Google

We next hear of the G. as settled on the coast of the Black Sea, about the mouths of the Danube, early in the 3d century. But at what time, or under what circumstances their migration from the Baltic to the Euxine took place, it is impossible to ascertain. "Either a pestilence or a famine," says Gibbon, "a victory or a defeat, an oracle of the gods or the eloquence of a daring leader, were sufficient to impel the Gothic arms on the milder climate of the south." In their new home, which was also the country of the Getæ (whence, perhaps, the error that confounded them with that people), the G. increased both in numbers and strength, so that as early as the reign of Alexander Severus (222—235 A.D.), they made some formidable inroads upon the Roman province of Dacia. In the reign of Philip (244—249 A.D.), they ravaged that province and even advanced to the siege of Marcianopolis in *Mœsia Secunda*. The inhabitants ransomed their lives and property by a large sum of money, and the invaders withdrew for a time to their own country. Under Decius, however, they again entered Mœsia to the number of about 70,000, led by a king named Cniva. Decius himself advanced to meet them, and found them engaged before Nicopolis. On his approach they raised the siege and marched away to Philippopolis, a city of Thrace near the foot of Mount Hæmus. Decius pursued them by forced marches, but at a convenient opportunity the G. turned with unexampled fury upon the Roman legions and utterly defeated them. Philippopolis next fell before them by storm, after a long resistance, during which and the massacre that followed, 100,000 of its inhabitants are reported to have been slain. This was in 250 A.D. In the following year another tremendous battle took place near an obscure town called Forum Trebonii, in Mœsia, in which the Romans were again defeated with great slaughter, the Emperor Decius and his son being in the number of the slain. The succeeding emperor, Gallus, purchased their retreat by an immediate present of a large sum of money, and the promise of an annual tribute for the future. The G. now set themselves to the acquisition of a fleet, and with this in 253 advanced to the conquest of Pityus, a Greek town on the northeastern coast of the Black Sea, which they completely destroyed. In 258 they besieged and took Trebizond, when a great fleet of ships that were in the port fell into their hands. In these they deposited the booty of the city, which was of immense value, chained the robust youth of the seacoast to their oars, and returned in triumph to the kingdom of Bosporus. In the following year, with a still more powerful force of men and ships, they took Chalcedon, Nicomedia, Nice, Prusa, Apaurœa, and Cius. In a third expedition, which numbered as many as 500 vessels, they took Cyzicus, then sailed down the Ægean, ravaged the coast of Attica, and in 262 anchored at the Piræus. Athens was now taken and plundered, and many other renowned places in Greece were either partially or wholly destroyed. Even Italy was threatened; but, says Gibbon, "the approach of such imminent danger awakened the indolent Gallienus from his dream of pleasure." The emperor appeared in arms; and his presence seems to have checked the ardor, and to have divided the strength of the enemy. A portion of the G. now returned to their own country. But in 269 they again started on a maritime expedition in far greater numbers than ever. After ravaging the coasts of both Europe and Asia, the main armament at length anchored before Thessalonica. In Claudius, the successor of Gallienus, however, the G. found a far abler general than any they had yet contended with. This emperor defeated their immense host, said to number as many as 320,000 men, in three successive battles, taking or sinking their fleet, and after an immense slaughter of their troops, pursuing such as escaped until they were hemmed in by the passes of Mount Hæmus, where they perished for the most part by famine. This, however, was only a single reverse. Aurelian, the successor of Claudius, was obliged to cede to them in 272, the large province of Dacia, after which there was comparative peace between the combatants for about fifty years. In the reign of Constantine, their king, Araric, again provoked hostility, but was obliged eventually to sue for peace with the master of the Roman empire. Under Valens, they once more encountered the Roman legions, with whom they carried on a war for about three years (367—369), with tolerable success. They now began to be distinguished by the appellations of Ostro-Goths and Visi-Goths, or the G. of the East and West; the former inhabiting the shores of the Black Sea, and the latter the Dacian province and the banks of the Danube. On the irruption of the Huns, the Visigoths sought the protection of Valens against those barbarians, and in 375 were allowed by him to pass into Mœsia,

Digitized by Google

to the number of about 200,000. Great numbers of them also now took service in the Roman army; but a dispute soon arose between the G. and their new allies, which led to a decisive battle, in 378, near Adrianople, in which the emperor Valens lost his life. The G. now threatened Constantinople, but were not able to take it; and during the reign of Theodosius, there was again a period of comparative peace.

Henceforward, the history of the Visigoths and Ostrogoths flows in two rather divergent streams. Before tracing either of these, however, it should be mentioned that the G., for the most part, became converts to Christianity about the middle of the 4th c., adopting the Arian form of belief, in accordance with the instructions of their renowned teacher and apostle, Bishop Ulfilas. Here, also, it may be stated that the term Mœso-Goths was applied to certain of the Western G., who having settled in Mœsia, there devoted themselves to agricultural pursuits, under the protection of the Roman emperors.

Visigoths.—Upon the death of Theodosius the Great, in 395, and the partition of the empire between Honorius and Arcadius, the renowned Alaric, king of the Visigoths, sought the command of the armies of the eastern empire, and upon being refused, invaded Greece with an army of his countrymen. About 400, he invaded Italy, took and pillaged Rome (410), and was preparing to carry his arms into Sicily and Africa, when his career was arrested by death. See ALARIC. Alaric was succeeded in the sovereignty by Athaulf (410—415), who, having married Placidia, the sister of Honorius, withdrew from Italy into the south of Gaul, and about 412 crossed the Pyrenees into Spain. Athaulf was assassinated at Barcelona, and his successor, Sigeric, dying the same year, the choice of the G. now fell on Wallia (415—418), who extended his power over a great part of Southern Gaul and Spain, and made Toulouse his capital. The G., under this monarch, greatly assisted the Romans in their contests with the Vandals and the Alani. Wallia was succeeded by Theodoric I. (418—451), son of the great Alaric. He lost his life in the bloody engagement of Châlons-sur-Marne, leaving the throne to his son Thorismund (451—452), who, however, was assassinated by his brother Theodoric II. (452—466), who reigned for some years, but was at length himself assassinated by his brother Euric (466—483), whose reign was unusually brilliant and successful. He extended the sovereignty of the Visigoths considerably both in France and Spain, introduced the arts of civilisation among his subjects, and drew up for their use a code of laws, in which were embodied many sound principles of jurisprudence. Under his successors, Alaric II. (483—506) and Amalaric (506—531), however, the kingdom of the Visigoths declined before that of the Franks. The former fell by the hand of Clovis in battle in 507, and the latter was killed either in battle or by the hand of an assassin in the year 531. Under his successor Theudes, the rule of the Visigoths was confined exclusively to Spain. Theudes was in his turn assassinated in his palace at Barcelona in the year 548. It will not be necessary to trace the long line of Visigothic kings that subsequently ruled in Spain from this period down to the year 711. The Visigothic power was completely broken, and their last king, Rodrigo or Roderick, slain by the Saracen invaders on the battle-field of Xeres de la Frontera.

Ostrogoths.—At the time when the Visigoths were admitted by Valens within the boundaries of the Roman empire, the same favor was solicited by the Ostrogoths, but was refused them by that emperor. They revenged themselves for this slight or injury by making frequent incursions into the Roman territories, sometimes on their own account, and sometimes as the allies of the Visigoths. In 336, the Ostrogoths sustained a severe defeat under their king or general, Alatheus, in attempting to cross the Danube, when many thousands of them perished, either by the sword of the Romans, or in the waves of the river. After this, they obtained a settlement in Phrygia and Lydia, but were ever ready to aid any fresh band of barbarians that prepared to assault the empire. Thus, they joined Attila in his renowned expedition against Gaul (450—453), and fell by thousands under the swords of their kinsmen the Visigoths at the battle of Châlons-sur-Marne. After this, they obtained a settlement in Pannonia, whence they pressed upon the eastern empire with such effect, that the sovereigns of Constantinople were glad to purchase their forbearance by large presents of money. In 475, Theodoric, the greatest of the Ostrogoth sovereigns, succeeded to the throne upon the death of his father Theodemir. He directed his arms almost immediately against the eastern emperor Zeno; and having gained

Digitized by Google

considerable advantages over him, obtained a grant of some of the richest provinces in the empire. Eventually, he was named chief of the imperial guard, and indeed consul for the year 484. In 488, with the consent and advice of Zeno, he planned an immense expedition against Odoacer, king of Italy, who had held that title since 476, when he dethroned Augustulus, the last of the western emperors. Theodoric utterly defeated Odoacer, slew him, it is said, with his own hand, and reigned undisturbed sovereign of Italy until his death in 526. The seat of his empire was at Ravenna, which he sometimes exchanged for Verona, and once—i. e., in 500—he visited Rome, when he convened a meeting of the senate, and declared that it was his intention to rule the people committed to his charge with even-handed justice. To a great extent, he fulfilled this promise, and governed his subjects upon the whole wisely and to their advantage. The glory of his reign was however, sullied by the execution of two of the most distinguished men of that age, Boethius and Symmachus, upon the plea that they were engaged in a conspiracy against him. During his reign, the Ostrogoth kingdom included, besides Italy, all the adjoining countries within the Rhone and the Danube; also the modern Bosnia, Servia, Transylvania, and Wallachia. In the disorders consequent upon the death of Theodoric, the Emperor Justinian sought to win back Italy to the allegiance of the emperors of Constantinople; and for this purpose he despatched Belisarius at the head of an army into that country. In 536, Belisarius entered Rome, which he held for his master, although invited by the G. to become himself their king; but all his and his successor's efforts to subdue the G. were at that time utterly fruitless. Totila (541—552), a noble Goth, was elected as successor to Vitiges, the antagonist of Belisarius, but was conquered in the battle of Tagina, by the imperial general, Narses, in the year 552. In that battle, Totila received his death-wound, and was succeeded by Teias, who did all that a brave man could to repair the misfortunes of his countrymen. It was to no effect, however, for he also was killed in battle in the following year, when "his head," says Gibbon, "exalted on a spear, proclaimed to the nations that the Gothic kingdom was no more." The Ostrogoths, broken and dispersed by their calamities, henceforward disappear from history as a distinct nation, their throne in Italy being filled by the exarchs of Ravenna; while the nation generally became absorbed in the indiscriminate mass of Alani, Huns, Vandals, Burgundians, and Franks, who had from time to time established themselves in the dominions of the old Roman empire.

GOTLAND (Götaland, or Götarike), the most southern of the three old provinces or main divisions of Sweden (q. v.). G. is now divided into 12 læns or departments; it has a superficial area of about 37,000 square miles, or one-fifth that of all Sweden, and a pop. of above 2,300,000. The greater part of the region, more especially in the north and in the interior, is covered with mountains, forests, and lakes, but its southern districts contain some of the most fertile land in Sweden. The principal lakes are the Wener (q. v.) and the Wetter (q. v.). The river Göta, which was unfit for navigation on account of its cataracts, the most picturesque of which is Trollhättan, has been rendered navigable by the construction of numerous locks and canals, and it is now open to vessels of considerable burden from Gottenborg, on the Cattegat, to Lake Wener, from whence the Göta Canal extends the line (of 260 miles) of internal communication across the kingdom to its eastern shores. G. comprehends a large portion of the mining districts, and is especially rich in iron and alum, and yields good copper, nickel, coal, &c. The peasantry are superstitious, attached to their old traditional usages and their national costume, but are honest and industrious, hospitable and contented.

GOTTENBORG (Swed. *Göteborg*), next to Stockholm, the most important city of Sweden, in lat. 57° 41′ n., long. 11° 58′ e., and the principal town of the læn of Gottenborg. The population, in 1874 was 63,748, exclusive of its extensive environs. G., which was founded by Gustavus Adolphus in 1618, is situated on the river Göta, a few miles from the Cattegat, and consists of a lower and upper town; the former intersected by numerous canals, which are bordered by *allées* of fine trees, and spanned by numerous bridges; and the latter picturesquely scattered over the adjacent rocky heights. Its admirable harbor, which is protected by three forts, affords safe anchorage to ships of heavy burden, and has long been noted for its extensive foreign commerce. The upper parts of the town have wide and regular streets and

Digitized by Google

good stone houses; but there are few buildings deserving of special notice excepting the new church, the Exchange, the Cathedral, the Town-hall, and Arsenal. G. is the see of a bishop, and the seat of the government of the district. It has good schools, one of them founded by Oscar I. for the children of soldiers; a public library; an academy of science and literature, which was incorporated in 1775; &c. The Göta Canal, which connects the German Ocean and the Baltic, brings G. into direct communication with Stockholm and a great portion of the interior of the kingdom, which it supplies with the products of foreign commerce and its own home-industry. The latter is of considerable importance, and includes, besides ship-building, extensive manufactories of woollen and cotton goods, sail-cloths, tobacco, snuff, glass, paper, sugar, and porter. In 1872, 3961 vessels, of 1,147,032 tons, entered and cleared the port. The exports are iron, copper, deals, tar and pitch, alum, fish, &c.; and the imports, salt, cereals, wine, and articles of colonial trade. The great feature of the G. *Licensing System*, which has acquired some notoriety in this country, is the elimination of private profit in the sale of spirits, by having the public-houses conducted by managers paid by salary, while the profits are paid into the town treasury.

GOTTFRIED VON STRASBURG, or Godfrey of Strasburg, so called, it is believed, either from having been born, or from having resided in the town of Strasburg in Alsace, was one of the most eminent poets or minnesingers of the Middle High German period. He flourished during the latter half of the 12th century. His chief work, "Tristan," in the composition of which he was employed at his death, and which extends to about 20,000 stanzas, was written about the year 1207, during the lifetime of Hartmann of Aue, whom he celebrates as the first of German narrators, and after the publication of the first portion of Wolfram von Eschenbach's "Parcival," to the prologue to which he alludes. Eilhart of Oberge had worked up the story of "Tristan" from a French poem. G. founds his story on another French poem (of which considerable fragments are still extant), and names as the author Thomas of Brittany, who, however, is not to be confounded with the half or wholly fabulous Thomas of Ercildonne, referred to in the old English story of "Tristan," published by Sir Walter Scott. Besides "Tristan," some lyric poems by G. are still extant. G.'s works, with later continuations of "Tristan," were published by Von der Hagen (1823). An admirable edition of G. has been furnished by Bechstein (1869; 2d ed. 1873). Modern German translations have been given by Kurtz and Simrock. Wagner has made use of "Tristan" for his opera "Tristan und Isolde."

GOTTINGEN, a town in the former kingdom of Hanover, in lat. 51° 31′ n., long. 9° 56′ e., and one of the pleasantest in Lower Germany, is situated in a fruitful valley on both banks of an artificial arm of the Leine, called the New Leine, about 60 miles south of Hanover. It is in general well built, but is almost destitute of fine edifices, and has an air of solitude, which even the number of students cannot dissipate. The *Rathhaus*, an old castellated and picturesque edifice; the educational institutions, of which there are many; the hospital, and the university, are the only buildings of any note. The university was instituted by George II., king of England and Elector of Hanover, in 1734, and opened 17th September 1737. Connected with it are the library, containing over 500,000 vols. and 5000 manuscripts; the Royal Society, founded 1750, which publishes the well-known transactions and the "Göttinger Gelehrte Anzeigen;" the observatory; the art museum, with collections of old oil-paintings, of engravings, of coins and models of all sorts, and some casts from the antique; the lying-in hospital, the chemical laboratory, and the botanic gardens (laid out under Haller's superintendence in 1739), one of the chief ornaments of the town. From 1823 to 1826, the number of students attending the university of G. averaged 1481 annually; but in consequence of the troubles of 1831, the number in 1834 had fallen to 860. The university could, however, still boast a rare assemblage of distinguished teachers, such as Blumenbach, Dahlmann, Ewald, Gauss, Gervinus, Gieseler, Herbart, Lücke, Otfr. Müller, the brothers Grimm, &c.; but the expulsion in 1837 of the "seven professors," Albrecht, Dahlmann, Ewald, Gervinus, the two Grimms, and W. Weber, for political reasons, inflicted a blow upon the university from which it has never fully recovered. It has upwards of 100 professors of various grades, many of whom are men celebrated throughout Europe. The

Digitized by Google

number of students in 1877 was 991. The chief manufactures of the town are hosiery, leather, and musical and scientific instruments; but the only flourishing trade of G. consists in the sale of tobacco and tobacco-pipes, books, and sausages. Pop. (1875) 17,057.

GOTTSCHED, Johann Christoph, a once popular German writer, was born at Judithenkirch, near Königsberg, in Prussia, February 2, 1700, and at the age of 14 entered the university of Königsberg with the intention of studying for the church, but he soon turned his attention to philosophy, the fine arts, and languages. In 1724, he removed to Leipsic, where in 1730 he became extraordinary professor of philosophy and poetry, and in 1734 professor of logic and metaphysics. He died 12th December 1766. G.'s great merit lay in his endeavoring to make the German language the vehicle of instruction for his countrymen in literature and science. In other respects, he was essentially French; and his clear, calm, and "correct" understanding naturally led him to admire writers like Racine and Boileau, and to value elegance, precision, and purity of style more highly than all other merits. G. executed a multitude of poems, critical and philosophical works, translations, &c. His tragedy, "Der Sterbende Cato" (The Dying Cato), which in the days of its popularity, went through not less than ten editions, is now regarded by his countrymen as a frightful specimen of "correct" and watery verse. See BODMER.

GOUDA (Dutch, *Ter Gouwe*), a town of Holland, in the province of South Holland, is situated on the right bank of the Hollandsche Yssel, where it is joined by the Gouwe, 11 miles north-east of Rotterdam. It has a large market-place, consisting of a spacious square, which contains the town-house and the church of St John. The latter building has 31 magnificent stained glass windows, gifted by Philip II. of Spain, Margaret of Austria, William I. Prince of Orange, and other high persons. They were executed between 1555 and 1603 by the brothers Crabeth and others, and are among the finest in Europe. G. is famed for its pipes. The clay used in this manufacture is brought from Coblenz and Namür. It has also numerous potteries, extensive brick and tile works. The bricks are called Cliukers, and are much used in building and in paving. G. also manufactures cotton, woollen, and sailcloths, has rope-walks, gin-distilleries, breweries, and a famous cheese-market. There is a stearine-candle factory which, in 1874, employed 175 men and 250 women. Book-printing, making leather, and soap-boiling are also industries. Pop. (1875) 16,576.

GOUGH, John B., American temperance lecturer, was born at Sandgate, Kent, England, August 22, 1817; his father, a pensioner of the Peninsular War; and his mother, a village schoolmistress. At the age of 12, he went to America as an apprentice, and worked on a farm in Oneida county, New York. In 1831, he went to New York City, where he found employment in the binding department of the Methodist book establishment; but habits of dissipation lost him this employment, and reduced him to that of giving recitations and singing comic songs at low grog-shops. He was married in 1839; but his drunken habits reduced him to poverty and delirium tremens, and probably caused the death of his wife and child. A benevolent Quaker induced him to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others. In 1842, he had a short relapse into drunkenness; but an eloquent confession restored him to favor, and he lectured in various parts of America with great success. In 1853, he was engaged by the London Temperance League to lecture two years in the United Kingdom, where he drew large crowds by his earnest, and by turns amusing and pathetic orations. An Autobiography, giving the details of his experience, and a volume of his Addresses, have had a wide circulation.

GOU'KEKA, Gotcha, or Sevang, Lake of, a deep inland lake of Russian Armenia, in lat. 40° 8'—40° 35' n., and long 44° 45'—45° 35' e., 80 m. n.e. of Erivan. It is 47 m. in length from n.w. to s.e., is 15 m. in average breadth, and is situated in a mountainous district at an elevation of 5300 feet above sea-level. The principal facts known about this lake are, that it is very deep, and yields good fish; that its banks abound in volcanic products; and that, without having any considerable outlet, it receives the waters of several streams.

GOUNOD, Félix Charles, an eminent French operatic composer. He was born in Paris in 1818, studied at the Conservatoire there under Halévy, and also under

Digitized by Google

Lesueur and Pauer. Obtaining the first prize of the Institute in 1839, he was sent to Rome to complete his musical education; and while there, devoted himself chiefly to religious music. On his return to Paris, he was for a time attached to the church of the Missions Etrangères, where his earliest compositions were performed: one of them, a "Messe Solennelle," was the first work which brought him into general notice. For a time, he contemplated taking orders, and went through part of the preliminary novitiate. His first opera, "Sapho," was produced in 1851; in 1852, he wrote choruses for Ponsard's drama of "Ulysse;" and in 1854 appeared his opera of "La Nonne Sanglante." His comic opera, "Le Médecin malgré lui," produced in 1858, was a great success; it was followed in 1859 by "Faust," which at once attained a widespread European popularity, and raised its composer to the foremost rank of contemporary musicians. "Philémon et Baucis" followed in 1860; in 1862, "La Reine de Saba" (brought out afterwards in England as "Irene"), and "La Colombe;" in 1861, "Mirelle;" and in 1867, "Romeo and Juliet." The oratorio of "Tobias," written in 1864, was first performed in London in 1866. In G.'s compositions are to be found deep musical science, a profusion of new and original combinations, and an almost unequalled command of the resources of the orchestra. There is great dramatic power in his operas, and one of their marked features is the prominence given to declamation over melody.

GOURA (*Lophyrus coronatus* or *Columba coronata*), by far the largest of the pigeon family (*Columbidæ*), a native of Java, New Guinea, and other islands of the Indian Archipelago. It is two feet four inches in length from the tip of the bill to the extremity of the tail. It is a very beautiful bird, of a grayish-blue color, parts of the back and wings black and purplish-brown, a broad white bar across the wings. The head is adorned with a large semicircular crest of narrow straight silky feathers, always carried erect. The G. is in the highest esteem for the table, and might probably be domesticated with great advantage in tropical countries; but attempts which have been made to introduce it into the poultry yards of Holland have completely failed, owing to the climate.

GOURD (*Cucurbita*), a genus of plants of the natural order *Cucurbitaceæ*, nearly allied to the cucumber; having male and female flowers on the same plant, the flowers large and yellow. The species are annual plants of very rapid growth; their leaves and stems rough; their leaves broad and lobed; their stems often very long and trailing; natives of warm climates, although the native region of the kinds chiefly cultivated is very uncertain, and they have probably been greatly modified by long cultivation, so that perhaps all of them may be forms of one original species, a native of some of the warmer parts of Asia. The COMMON G. or PUMPKIN (*C. pepo*), with smooth globose or pear-shaped fruit, varying from the size of a large apple to fifty or seventy pounds in weight, is much cultivated both in gardens and fields in almost all parts of the world of which the climate is warm enough for it; and the fruit is not only a very important article of human food, but is also used along with the superabundant shoots for feeding cattle. In many countries, pumpkins are a principal part of the ordinary food of the poorer classes, and are much used even by the wealthy; they are not eaten raw, but dressed in a great variety of ways—as in pies, with apples, sugar, spice, &c., or sliced and fried with oil or butter, or made into soups, &c. Pumpkins are much cultivated in North America. In England, they are also cultivated, but not to a great extent, and never as food for cattle. It is not unusual for English cottagers to plant them on dung-hills, and to train the shoots along the neighboring grass.—The VEGETABLE MARROW (*C. ovifera* or *C. succada*) appears to be a mere variety of the pumpkin. It was introduced into Europe from Persia since the beginning of the 19th c., but is now more generally cultivated in Britain than any other kind of G., being one of the most hardy, and its fruit of excellent quality and useful for culinary purposes at almost every stage of its growth. When full grown the fruit is elliptic, very smooth, generally about nine inches long, and four inches in diameter; but these dimensions are occasionally much exceeded.—One of the most valuable gourds for culinary purposes is the GREAT G. (*C. maxima*); of which the Spanish G. is a green-fruited variety; and the Great Yellow G., the largest of all, has yellow fruit, with firm flesh of a deep yellow color. It is sometimes fully 200 lbs. in weight, and eight feet in circumference. The form of the fruit is a somewhat flattened globe; when

Digitized by Google

boiled, it is a very pleasant and wholesome article of food. It is much cultivated in the south of Europe.—The SQUASH (*C. melopepo*) differs from all these in generally forming a bush, instead of sending out long trailing shoots; also in the extremely flattened fruit, the outline of which is generally irregular, and its whole form often so like some kinds of cap, that in Germany one variety is commonly known as the "Elector's Hat," and the name "Turk's Cap" is bestowed on another. The Squash is regarded as one of the best gourds, and is much cultivated in some parts of Europe and in North America.—The WARTED G. (*C. verrucosa*), which has a very hard-skinned fruit covered with large warts, and the MUSK G. (*C. moschata*), distinguished by its musky smell, are less hardy than the kinds already named; as is also the ORANGE G. (*C. aurantia*) sometimes cultivated on account of its beautiful orange-like fruit, which, however, although sometimes edible and wholesome, is not unfrequently very unfit for use, on account of colocynth developed in it. This is apt to be the case in some degree with other gourds also, but the bitter taste at once reveals the danger. The same remark is applicable to the young shoots and leaves, which, when perfectly free from bitterness, are an excellent substitute for spinach. In Scotland, even the most hardy gourds are generally reared on a hot-bed and planted out. In England, it has been suggested that railway-banks might be made productive of a great quantity of human food by planting them with gourds. Ripe gourds may be kept for a long time in a cool well-ventilated place, nor are they injured by cutting off portions for use as required. The name G. is often extended to many other *Cucurbitaceæ*.

GOUT (Fr. *goutte*, from Lat. *gutta*, a drop), a medieval term of uncertain date, derived from the humoral pathology (see RHEUMATISM), indicating a well-known form of disease, which occurs for the most part in persons of more or less luxurious habits, and past the middle period of life. The acute attack of gout begins most commonly by a painful swelling of the ball of the great toe or of the instep, sometimes of the ankle or knee; much more rarely, it attacks both lower limbs at once; and more rarely still, it seizes first upon some other part of the body, the foot being either not attacked at all, or becoming involved at a later period. In the great majority of cases, the foot is not only the first part attacked, but the principal seat of the disease throughout; according to Scudamore, indeed, this is the order of events in not much less than four-fifths of the cases. In exceptional instances, the ankle, knee, hand, elbow, &c., are attacked at first; now and then, the disease smoulders in the system in the form of disorders of the digestive or nervous functions, or oppression of the circulation for some considerable time before it takes the form of "regular" gout—that is, of an acute attack, or fit, of gout in the foot. The name podagra (Gr. *pod*, foot, and *agra*, seizure) indicates the leading character of the disease as apprehended by all antiquity; and the very numerous references to the disorder so called, not only in the medical writings of Hippocrates, Galen, Aretæus, Cælius Aurelianus, and the latter Greek physicians, but in such purely literary works as those of Lucian, Seneca, Ovid, and Pliny, shew not only the frequency, but the notoriety of the disease. The allusions, indeed, are of a kind which give ample proof that the essential characters of gout have not been changed by the lapse of centuries; it is caricatured by Lucian in his burlesque of "Tragopodagra" in language quite applicable to the disease as now observed; while the connection of it with the advance of luxury in Rome is recognised by Seneca ("Epist." 95) in the remark that in his day even the women had become gouty, thus setting at naught the authority of physicians, which had asserted the little liability of women to gout. Pliny likewise (book 26, chap. 10) remarks upon the increase of gout, even within his own time, not to go back to that of their fathers and grandfathers; he is of opinion, further, that the disease must have been imported; for if it had been native in Italy, it would surely have had a Latin name. Ovid and Lucian represent gout as mostly incurable by medicine; from this view of it, Pliny dissents. The list of quack remedies given by Lucian is one of the most curious relics of antiquity.

In the present day, gout is observed to prevail wherever there is an upper class having abundant means of self-indulgence, and living without regard to the primeval law of humanity, "in the sweat of thy face shalt thou eat bread." The directness, however, with which gout can be traced, in particular cases, to its predisposing causes is very various; and in many instances, a well-marked hereditary tendency

Digitized by Google

to the disease may be observed, which even a very active and temperate life can scarcely overcome; while, on the other hand, the most gross forms of excess may be practised for a whole lifetime without incurring the gouty penalty. It is difficult to explain these variations; but they leave unaffected the general principle, that gout is a disease especially of the wealthy, and most of all of those who have little physical exertion, and give great scope to the bodily appetites. The prevention, and cure, accordingly, have been at all times recognised as being mainly founded on temperance, combined with the cultivation of active and regular habits as to exercise. Many amusing stories are told having this moral, and shewing how gout has been cured by the opportune occurrence of calamities which have created the necessity for labor, and removed the means of self-indulgence. With a few special exceptions, indeed, it may be said that the laboring class, and especially those that labor in the open air, are almost, if not altogether free from this disease. Those, again, that labor much with the mind, not being subject either to great privations, or to the restraint of unusually abstemious habits of life, are remarkably subject to gout; the more so if their bodily and mental constitution has been originally robust, and fitted by nature for a degree of activity which the artificial necessities of fashion or of occupation have kept within too narrow limits. Hence, the well-known saying of Sydenham, that gout is almost the only disease of which it can be said that it "destroys more rich men than poor, more wise men than simple." And in this manner accordingly (he adds), there have lived and died "great kings, princes, generals, admirals, philosophers, and others like these not a few." Gout is, therefore, the counterpoise in the scales of fortune to many worldly advantages; the poor and needy have it not, but suffer from their own peculiar calamities; the favorites of fortune are exempt from many privations, but this very exemption paves the way for the gout; whereby even in this world Dives suffers as well as Lazarus, and sometimes, it may be, learns the lesson of his suffering. Such is the sense, though not the exact words, in which, nearly two hundred years ago, Sydenham expressed the convictions of a lifetime on this subject.

Sydenham's treatise on gout is interesting not only as containing the well-considered views of a master in the medical art, but also as the faithful description of the disease by one of the victims of it. His account of the paroxysm of regular gout may be given here with some abbreviation. After some weeks of previous indigestion, attended with flatulent swelling and a feeling of weight, rising to a climax in spasms of the thighs, the patient goes to bed free from pain, and having had rather an unnaturally strong appetite the day before. In the middle of the night, he is awakened by a pain in the great toe, or sometimes in the heel, the ankle, or the calf of the leg. The pain resembles that of a dislocated bone, and is accompanied by a sense as if water not perfectly cold were poured over the affected limb; to this succeeds chilliness, with shivering, and a trace of feverishness, these last symptoms diminishing as the pain increases. From hour to hour, until the next evening, the patient suffers every variety of torture in every separate joint of the affected limb; the pain being of a tearing, or crushing, or gnawing character, the tenderness such that even the weight of the bed-clothes, or the shaking of the room from a person's walking about in it, is unbearable. The next night is one of tossing and turning, the uneasy limb being constantly moved about to find a better position; till towards morning the victim feels sudden relief, and falls over into a sleep, from which he wakes refreshed, to find the limb swollen; the venous distention usually present in the early stage having been succeeded by a more general form of swelling, often with itching between the toes, and a peeling-off of the cuticle. This individual attack may be repeated many times, in the course of what is termed "a fit of the gout," which commonly extends over a period of weeks, or even months, before the patient is completely relieved; or the attacks may occur in both limbs, or in several other parts of the body in succession, the real termination of the "fit" being at last indicated by an apparently complete restoration of health, and even, in some cases, by a period of improved condition and capacity for exertion, as compared with the state of the patient before the attack.

Such are the principal features of the "regular gout." In this form, it might almost be called a local disease; although the connection of the attacks with deranged digestion, or with a variety of other minor ailments too complex to be described here, and the obvious relief obtained through the "fit" from the symptoms of con-

Digitized by Google

stitutional suffering, point to a cause of the disease operating over a larger range of functions than those included in the ordinary local manifestations at this period. Regular gout, accordingly, forms only part of a nosological picture, in which the so-called regular, atonic, metastatic, or retrocedent forms have to be included before it can be said to be at all complete. These, indeed, form almost all the darker shadows of the picture; for regular gout, though a very painful disorder, can hardly be said to be dangerous to life, or even to the limb affected, at least until after many attacks.

It is the tendency, however, of gout, when recurring often, to fall into irregular forms, and herein lies its danger. One source of local aggravation is, indeed, soon apparent, and it leads rapidly to other evils. The joints which have been repeatedly the seat of the regular paroxysm, become, more or less permanently, crippled and distorted. A white, friable, chalk-like material is gradually deposited around the cartilages and ligaments, and sometimes in the cellular tissue and under the skin. Sometimes this material is discharged externally by ulceration, and then usually with relief. At other times, it accumulates into irregular masses, or "nodosities," which entirely destroy, or at least greatly impair, the movement of the limb. The patient is laid up more or less permanently in his arm-chair; and exercise, the great natural specific remedy of the gouty, is denied by the very conditions of the diseased state itself.

Then follow aggravations of all the constitutional sufferings; the more so, perhaps, in proportion as the local attacks in the foot become obscurely marked. Indigestion continues, or becomes constant, assuming the form chiefly of acidity after meals; the liver becomes tumid, the abdomen corpulent, the bowels disposed to costiveness; the kidney discharges a vitiated secretion, and not unfrequently there is a tendency to gravel and Calculus (q. v.); the heart is affected with palpitations, or fainting-fits occur, sometimes with spasmodic attacks of pain; the arteries become the seat of calcareous deposits, and the veins are varicose in the limbs and in the neighborhood of the lower bowel (see PILES); the temper is singularly irritable, and often morose; then, sooner or later, the appetite fails, or is only kept up by very stimulating and unwholesome diet, with an excess of wine or of alcoholic liquors; in the end, the body emaciates, the energy of all the functions becomes enfeebled, and the patient falls a prey to diarrhœa, or to some slight attack of incidental disease. Sometimes the end is sudden, as by apoplexy or structural disease of the heart; sometimes, on the other hand, it occurs in the midst of one of those violent spasms which have popularly acquired the name of "gout in the stomach;" the true character of these attacks, however, being by no means well understood.

The sketch here given of the leading external phenomena of gout is very incomplete, as every popular description, to be at all intelligible, must necessarily be. But the reader will not fail to see in it the type of a disease occurring under a number of remarkably varied forms, and lurking in the constitution, at times, under the most strangely anomalous disguises, or even under the general aspect of robust or rude health. It has been an object, accordingly, with physicians to trace out the gouty predisposition under the name of a habit of body, or *diathesis*, cognisable previously to any of the local manifestations. At this point, however, the ideas of authorities usually become hazy, and their descriptions correspondingly ill defined or contradictory. The anomalous forms of the disease itself are also exceedingly difficult to describe accurately, and must on this account be left out of the present summary of the characters of the more usual aspects of gout, as it presents itself to physician and patient. The causes of the disease have been sufficiently indicated above.

One fact in regard to gout has relation to its intimate chemical and structural pathology, not less than to its outward characters; and forms, in fact, the pathological connection of a great number of its phenomena. The concretions found in the joints in all cases of well-marked and highly developed gout have nearly a uniform composition, into which the urate of soda (see URIC ACID) enters as a considerable proportion. Uric acid has long been known as one of the constant organic elements of the urine, through which it seems to be habitually expelled from the system. In certain circumstances, uric acid is deposited also in the form of urinary gravel or Calculus (q. v.); and it is this particular kind of gravel to which the gouty are especially subject, as we have indicated above. A conjunction of facts so striking as these could not but arrest the attention of pathologists; and it is long

Digitized by Google

since Sir Henry Holland and others threw out the hypothesis, that uric acid was to be regarded as the very *materies morbi* of gout, of which ancients and moderns had been so long in search. It would be out of place to enter on the discussion of this subject here; but it must be indicated as a fact of recent discovery, that uric acid in a certain excess has been shewn by Dr Garrod to be characteristic of the blood of the gouty, although a minute amount of this substance is probably present even in perfect health. The most recent speculations, accordingly, tend to connect the gouty predisposition either with an excessive formation, or a checked excretion, of this important nitrogenous organic acid, the product, as physiology teaches, of the vital disintegration of the flesh and of the food, after these have subserved the daily wants of the system. At this point, the inquiry rests for the present.

The *cure* of gout, in the highest sense of the word, demands the careful consideration of all its predisposing causes in the individual, and the strict regulation of the whole life and habits accordingly, from the earliest possible period. It is the difficulty of accomplishing this which makes gout a disease proverbially intractable; for the regular attacks of the disease seldom occur till pretty late in life, long after the habits have been fully formed which are most adverse to the cure. Rigid temperance in eating and drinking, with daily exercise proportionate to the strength and condition of the individual, in reality constitute the only radical cure of gout. the lesson of ages of experience as read to the gouty by the light of science. But the lesson is not learned, or only learned when too late. It should never be forgotten that a man of gouty family, or individually much exposed to the causes of the disease, can only hope to escape it in his old age by habits of life formed at an early period, and by a careful avoidance of most of the common dissipations of youth. That the disease may be warded off in this way, there is ample evidence; and it is not less certain that there is no other way of living secure from gout. The treatment of the fit, in so far as it does not resolve itself into the celebrated prescription of "patience and flannel," must be a subject of medical prescription. The well-known virtues of Colchicum (q. v.) are perhaps somewhat overrated by the public; and its dangers are not less striking than its virtues. It is certain, however, that in cautious medical hands colchicum is a remedy of great value in the gouty paroxysm; and of equal value, perhaps, are certain natural mineral waters, as those of Vichy and Carlsbad. Alkalies and their salts, especially potash and lithia waters, as prepared artificially, with minute doses of iodine and bromine, have likewise been much recommended for the cure of gouty deposits. For the distinctions of gout and rheumatism, and the presumed relation between them in some cases, see RHEUMATISM.

GOUT-WEED, or Bishop-weed (*Ægopodium podagraria*), a perennial umbelliferous plant, with coarse twice ternate leaves, ovate unequally serrate leaflets, stems from one to three feet high, and compound umbels; now a very common weed in gardens and waste ground in Britain, although believed to have been originally introduced by the monks from the continent of Europe, on account of the virtue ascribed to it of allaying the pain of gout and piles. It is a troublesome weed, very difficult of eradication. Its medicinal virtue is now discredited. Its smell is not agreeable, but its young leaves are used in Sweden in early spring as a pot herb. Another English name is Herb Gerard.

GO'VAN, a thriving and picturesque burgh of Scotland, in the county of Lanark, is pleasantly situated two miles west of Glasgow, with which it is connected by an elegant line of villas on the left bank of the Clyde. The prosperity of G. is chiefly dependent upon Glasgow, into which indeed it has become almost absorbed. It now contains several ship-building yards, which are carried on by Glasgow firms. There are also at G. a dye work and a factory for throwing silk. Pop. (1871) 19,200. In the 16th c. this ancient village was considered one of the largest in Scotland, and even down to the middle of the 17th c. it received the name of "Meikle Govane."

GO'VERNMENT, in its political signification, may be considered as including the power by which communities are ruled, and the means by which, and the form and manner in which this power is exercised. In treating of the subject, we shall first indicate those characteristics that seem essential to the existence of government altogether, and then proceed to mention the various forms which its machinery has assumed or is capable of assuming.

Digitized by Google

1. It is of the essence of every government that it shall represent the supreme power or sovereiguty of the state, and that it shall thus be capable of subjecting every other will in the community, whether it be that of an individual, or of a body of individuals, to its own. There is and can be no constitutional or fundamental law, not self-imposed, which is binding on a government in this, its highest sense. Whatever be the restraints which humanity, Christianity, or prudence may impose upon governments as on individuals, it is implied in the idea of a government that it should be politically responsible to no human power, at least for its internal arrangements, or in the language of politics, that it should be autonomous. The governments of states which are members of a confederation—as, for example, the states of the American republic, or the Swiss cantons—do not, it is true, possess this independent character. But in so far as they fall short of it, they are deficient in the characteristics of a government in the absolute sense, just as the states are states, not in the highest, but only in a subsidiary sense. The sovereign power with which government is thus armed may be an expression either of the general will of the community itself, as in free states, or of the will of a conqueror, and of the army which supports him, as in subject states. In the former case, the power of government over the individual citizen is as absolute as in the latter; but there is this very important difference between them, that in the former case he himself voluntarily contributes a portion of the absolute power to which he submits, whereas in the latter it is entirely independent of his volition. In the power which government possesses of controlling every other will, is implied the power of protecting every separate will from being needlessly or wrongfully controlled by any other will, or number of wills, the will of the government always excepted. With a view to the exercise of this latter power, government possesses a right, which politically is also unlimited—the right, namely, of inquiry into the relations between citizen and citizen. It is of its essence that its scrutiny should be as irresistible as the execution of its decrees. 2. Every government, whatever be its form, seeks the realisation of what we have described as its necessary character, by the exercise of three distinct functions, which are known at its legislative, judicial, and executive functions. The first, or legislative function of government, consists in expressing its sovereign will with reference to a particular matter, irrespective altogether of the effect which it may have on the interests of individuals; the second, or judicial, consists in applying the general rule, thus enunciated, to individual cases in which disputes as to its application have arisen; whilst the third, or executive function, consists in carrying into effect the determinations of the sovereign will, whether these determinations be expressed in the exercise of its legislative or its judicial functions.

In large communities, which are at the same time free—that is to say, in which the general will of the people is sovereign—the performance of the legislative functions of government almost necessarily implies the existence of a general council, parliament, or as it is often called, a legislature; whilst the performance of its judicial functions implies the existence of Judges and courts of justice, and of its executive that of a police and an army. But all of these, like the existence of councils of ministers, or servants of the sovereign will—governments in the narrower sense—and the rules by which their appointment, resignation, &c., are regulated, are practical necessities of government in certain circumstances, not theoretical necessities of government in the abstract.

The forms in which communities have sought to realise the idea of government, as thus explained, have been divided, from very early times, into three classes: 1st, monarchy, or that form in which the sovereignty of the state is placed in the hands of a single individual; 2d, aristocracy, or that in which it is confided to a select class, supposed to be possessed of peculiar aptitude for its exercise; and 3d, democracy, or that in which it is retained by the community itself, and exercised either directly, as in the small republics of ancient Greece, or indirectly, by means of representative institutions, as in the constitutional states of modern times. Each of these forms of political organisation, if called into existence by an expression of the general will of the community, maintained by its consent, and employed for its benefit, is said to be a legitimate government (Aristot. "Politic." lib. iii. c. 5)—that is to say, a government which vindicates the interests of the collective body of the people without needlessly encroaching on individual freedom of action.

Digitized by Google

But each of these legitimate forms was said by the ancient publicists (Aristot. *ut sup.* and III. 4, 7) to have a particular degenerate form to which it was prone. Monarchy tended in the direction of tyranny, or a government for the exclusive benefit of the single ruler; aristocracy to oligarchy, or a government for the exclusive benefit of the ruling class; and democracy to ochlocracy, or mob-government—a government in which the majority, who were necessarily the rudest and most ignorant portion of the community, exercised a tyranny over the more refined and cultivated few. Through these various forms, in the order in which we have enumerated them, each legitimate form being followed by its corresponding degenerate or perverted form, government was supposed to run in a perpetual cycle; the last form, ochlocracy, being followed by anarchy, or no government at all, which formed a species of interregnum so abhorrent to the social and political instincts of mankind as to induce them speedily to revert to monarchy, at the expense of subjecting themselves to a repetition of the misfortunes which they had already experienced. As a refuge from these evils, the so-called mixed government, or government which should combine the elements of order and permanence of two, at least, if not of all the three pure forms of government, whilst rejecting their tendencies to derangement and degeneracy, is supposed to have been devised. A union of aristocracy and democracy was the form in which Aristotle conceived the mixed government, and spoke of it under the title of the *politeia*. But the tripartite government was not unknown to speculators of even an earlier date. Plato had shadowed it forth in his laws, and Aristotle himself tells us that it had been treated of by other writers ("Politic." II. c. 8). Who these writers really were has been a subject of much speculation, but there is reason to believe that their works contained mere hints of the principle, and the first writer with whom we are acquainted to whose mind its practical importance was fully present is Polybius, who, with Cicero, by whom he was very closely followed in "the Republic," holds it to have been realised in the Roman constitution. The most famous example of the mixed government, however, is supposed to be exhibited in that balance of powers which has been so often said to form the essence of the English constitution. But in addition to the fact that these are not separate powers, but only separate organs of the one power or sovereignty which in free states is of necessity centered in the general will (see CONSTITUTION), it is extremely doubtful whether any period could be pointed out, either in our own history or in the history of any other nation, in which the sovereignty did not find expression obviously either through the one, the few, or the many; or whether such a period, if it did exist, was not a mere period of struggle and transition.

The question as to how far forms of government are a matter of choice on the part of a free people, or are dictated to them by influences which are beyond their volition, has been discussed in a very interesting manner by Mr Mill in his important work on "Representative Government." The conclusion at which he arrives is, that "men did not wake on a summer morning and find them sprung up; neither do they resemble trees, which, once planted, 'are aye growing' while men 'are sleeping;' but that 'in every stage of their existence they are made what they are by human voluntary agency'" (p. 4). This absolute power of human choice, however, is limited by three conditions which Mr Mill states thus: "The people for whom the government is intended must be willing to accept it, or at least not so unwilling as to oppose an insurmountable obstacle to its establishment; they must be willing and able to do what is necessary to keep it standing; and they must be willing and able to do what it requires of them to enable it to fulfil its purposes. . . . The failure of any of these conditions renders a form of government, whatever favorable promise it may otherwise hold out, unsuitable to the particular case" (p. 5). But there are still more important conditions, not here enumerated by Mr Mill, but one of which at least is fully recognised in the sequel of his work, which, if not complied with, render forms of government unsuitable not only to one case, or stage of social development, but to all cases and all stages of development. These conditions may be broadly stated as falling under a single category—viz., that forms of government must conform to the constitution of human nature, and recognise those arrangements of Providence which are beyond the reach of human control. This condition seems so obvious, that one would suppose it could scarcely be overlooked in fixing on a particular form of government, and yet there is none

Digitized by Google

which has been overlooked more frequently. The most prominent example—to which, in recent years, much importance has been attached by Mr J. S. Mill and all speculative politicians of note—is that in which a form of government is constructed on the assumption that "all men are equal," the fact of nature being the very opposite. Such a form of government, being founded on a false assumption, can be made to work only by the direct results of its action being counteracted by indirect means, as has been the case in all the so-called pure democracies that have had any permanent existence. The state in these cases is governed not in accordance with, but in spite of the form of government.

The famous discussions as to what is absolutely and in itself the best form of government, which has occupied so large a portion of human time and ingenuity, is one which we must here dismiss with the observation, that it rests on another question which has not been less keenly and perhaps scarcely less futilely discussed. The second question is, What is the end of government? for it is clear that could the end-in-itself (the *telos-teleion*) be discovered, we might limit the discussion as to the best form of government to an inquiry into the means which led most directly to the attainment of this end. Now there are, and have always been, two classes of speculators, who assign what appear to be different, and what by many are believed to be irreconcilable ends or objects to government, and indeed to human effort, separate as well as aggregate. By the one, the end of government is said to be "the greatest happiness of the greatest number," or the greatest amount of human happiness absolutely considered; by the other class, it is said to be the realisation of the idea of humanity—that is to say of the divine conception of human nature, through the instrumentality of society. The manner in which the first or Utilitarian creed has recently been expounded by its most important adherents, has had the effect of shewing that the two ends are in reality coincident. If happiness be so defined as to render it identical with moral, intellectual, and physical perfection, the advocate of the ideal end acknowledges that its attainment would involve, of necessity, the realisation of his own aspirations.

A difference of opinion as to the objects of government scarcely more real, though attended with far more fatal consequences than that which has divided speculative politicians, has ranged those who have dealt with government as a practical art in two opposite schools. By the one school, its object is said to be order; by the other, liberty; and each of these objects has been supposed to be attainable only to an extent proportioned to that to which the other was sacrificed. A truer insight into the laws of society has led a more enlightened school than either entirely to reverse this latter opinion; and—whilst holding the two objects referred to, to be in truth the proximate objects of all government—to perceive that they are not only reconcilable, but that each is attainable only in and through the other, and that the perfection with which either is realised in any particular instance will be, not in inverse, but in direct proportion to that to which the other is so. Order, so far from being the opposite of liberty, is thus the principle by which conflicting claims to liberty are reconciled. The principle which is really opposed to liberty is licence, in virtue of which the sphere of the liberty of one individual is endeavored to be carried into that of another. To the extent to which this takes place, the liberty of both is sacrificed, for the territory in dispute is free to neither of the claimants; whereas order, by preserving the boundary between them, assigns to each the portion which is his due, and prevents the waste of liberty which is necessarily involved in the gratification of licence, and the consequent existence of anarchy. The reasons which have led men to believe that the union between the principles of order and liberty which it is thus their mutual interest to effect, can, in large states, be effected by means of representative institutions better than by any other political expedient that has yet been devised, will be explained under REPRESENTATIVE GOVERNMENT. See also CONSTITUTION, MONARCHY, DEMOCRACY, LIBERTY, EQUALITY, and FRATERNITY.

GOWER, John, the date of whose birth is unknown (probably about 1320), is supposed, by his latest biographer, to have belonged to the county of Kent. His history is enveloped in almost total obscurity, but he seems to have been one of the most accomplished gentlemen of his time, and to have been in possession of considerable landed property. He was a personal friend of Chaucer's, who addresses him as a "moral Gower" in dedicating to him his "Troilus and Cressida"—an epithet

Digitized by Google

which has indissolubly linked itself to his name. He did not long survive his great contemporary, having died in the autumn of 1408. G. was a voluminous writer, and produced the "Speculum Meditantis" (a poetical discourse on the duties of married life). It consisted of ten books, written in French verse, but is supposed to have perished; the "Vox Clamantis," in Latin (of which there are manuscript copies in the Cottonian and Bodleian libraries); and the "Confessio Amantis," by which he is best known, in English. This latter work, extending to the portentous length of 30,000 verses, was first printed by Berthelet in 1532. An excellent edition of the works of G. was published in 1857, under the editorial care of Dr Reinhold Pauli, with a memoir and critical dissertation.

G. is almost uniformly heavy and prosaic. Writing much in French, his English poem is full of Norman-French words, and in his native tongue he never attained Chaucer's ease and mastery. Apart from literary merit or demerit, his poem is interesting to the scholar and the antiquary, because therein the elements which form our modern English are found side by side, or but indifferently fused together.

GOWRIE, Earse of. See PERTHSHIRE and CARSE.

GOWRIE CONSPIRACY, one of the most singular events in the history of Scotland, took place in August 1600. On the 5th of that month, as King James VI., then residing at Falkland Palace, in Fife, was going out to hunt, Alexander Ruthven, brother of the Earl of Gowrie, whose father had been executed for treason in 1584, came to his majesty, and informed him that, on the previous evening, he had seized a person of a suspicious appearance, and evidently disguised, with a pot full of foreign gold hid under his cloak, and had confined him in his brother's house at Perth. Conceiving him to be an agent of the pope or the king of Spain, the king agreed to examine the man himself, and, without waiting to change his horse, set out for Perth, attended only by the Duke of Lennox, the Earl of Mar, and about 20 others. Soon after his arrival, while his retinue were at dinner, Ruthven conducted the king up a winding staircase and through several apartments, the doors of which he locked behind him, and brought him at last to a small study, where stood a man in armor, with a sword and dagger by his side. Snatching the dagger from the man's girdle, Ruthven held it to the king's breast, and said: "Who murdered my father? Is not thy conscience burdened by his innocent blood? Thou art now my prisoner, and must be content to follow our will, and to be used as we list. Seek not to escape; utter but a cry, make but a motion to open the window, and this dagger is in thy heart." The king expostulated with Ruthven, who so far relented that he went to consult his brother, leaving the king in charge of the man in armor. In the meantime, one of Gowrie's servants hastily entered the apartment where the king's retinue were, and announced that the king had just ridden off towards Falkland. All hurried into the street, and the earl with the utmost eagerness, called for their horses. On Alexander Ruthven's return to the king, he declared that there was now no remedy, but that he must die, and proceeded to bind his hands with a garter. The king grappled with him, and a fierce struggle ensued. Dragging Ruthven towards a window looking into the street, which the man in armor had opened, the king cried aloud for help. His attendants knew his voice and hastened to his assistance. Lenox and Mar, with the greater number of the royal train, ran up the principal staircase but found all the doors shut. Sir John Ramsay, of the Dalhousie family, one of the royal pages, ascending by a back stair entered the study, the door of which was open, and seizing Ruthven, stabbed him twice with his dagger and thrust him down the stair, where he was killed by Sir Thomas Erskine and Sir Hugh Herries. On the death of his brother, Gowrie rushed into the room with a drawn sword in each hand, followed by seven retainers well armed, and was instantly attacked. Pierced through the heart by Sir John Ramsay, he fell dead without uttering a word. The inhabitants of Perth, by whom Gowrie, who was their provost, was much beloved, hearing of his fate ran to arms, and surrounding the house threatened revenge. The king addressed them from a window and admitted the magistrates, to whom he fully related all the circumstances, on which they dispersed and he returned to Falkland. Three of the earl's servants were executed at Perth. The man in armor, Andrew Henderson, the earl's steward, was pardoned. All who were examined were totally ignorant of the motives which had prompted the brothers Ruthven to such a deed, and they still remain in some degree of mystery, although recent discoveries have

Digitized by Google

led to a pretty general belief that the object of the conspirators was to possess themselves of the king's person, to convey him by water to Fast Castle, and either to give him up to England, or to administer the government in his name in the interest of that country and of the Presbyterian leaders at home. Most of the documents relating to the plot are printed.

GOYA Y LUCIENTES, Francisco, the most distinguished painter of the new Spanish school, was born at Fuente de Todos, in Aragon, 31st March 1746, and received his first education in art in the academy at San Luis, Saragossa. On his return from a visit to Rome, the talent and speed with which he executed some paintings for the royal tapestry manufactory gained the approbation of the celebrated Mengs, who superintended that work. His scenes from the common life of the Spanish people excited special admiration; but all the productions of his easel during this early period, to which belong the altar-piece and the crucifix at the entrance to the choir of the church of San Francisco al Grande in Madrid, are marked by simplicity of composition, charming truthfulness, and a natural and effective chiaro-oscuro. In 1780, he was elected member of the academy of San Fernando. From this time, the influence of Velasquez and Rembrandt is observable in his paintings. Among the most celebrated of these is his portrait of Charles IV., for which he was made court-painter. In general, his portraits were executed with great felicity and ease. In 1824, he went to Paris for his health, and continued to reside in France till his death, which took place at Bordeaux, 16th April 1828. Besides his works in oil-color, G. is celebrated for his essays in fresco-painting, etching, lithography, and in almost every department of his art.

GOYA'NNA, a city of Brazil, in the province of Pernambuco, is situated on a river of the same name, 35 miles north-west of Olinda. It has numerous factories and an active trade. Pop. upwards of 10,000.

GOYA'Z, a city of Brazil, is situated on the river Vermelho, in lat. 16° 21' s., long. 50° 35' w., nearly in the middle of the empire, being the capital of the central province, which bears its name. The city contains about 3500 inhabitants; and the province, with an area of 290,000 square miles, has, according to the government estimates in 1872, a population of only 180,000 (besides 15,000 Indians), mostly aborigines. The chief productions are cotton, timber, and cattle.

GO'ZO, or Gozzo (called by the Romans *Gaulos*), an island in the Mediterranean, belonging to Britain, is about 10 miles in length, and about 5 miles in breadth; has an area of 36 sq. m., and a pop. of 17,000. Its surface is agreeably diversified, and it has many fertile valleys. It appears to have been formerly connected with Malta, from which it is now separated by a channel four miles in width. On this account, and from its natural productions, it is a spot of the highest interest to the naturalist, while the cyclopean walls of the "Giant's Tower" and Roman monuments of a later period excite the attention of the antiquary. The island abounds in game, and is much frequented by sportsmen. It produces large quantities of grain and cotton, and is celebrated for cattle and for a breed of large asses. From the circumstance of its having two harbors, it is likewise of importance in a commercial and nautical point of view. The chief town is Rabato, situated near the centre of the island. The British governor resides in the Castel del Gozzo.

GOZZOLI, Benozzi, a famous fresco-painter, was born at Florence about the beginning of the 15th c., and studied under Fra Angelico, whose excellence as a painter of sacred subjects he fully equalled, if not surpassed. A glow of rejoicing life seems infused into all G.'s productions. His chief works bearing traces of his master's influence are frescoes in the churches of Orvieto and Rome; his own style being visible in the paintings he executed by command of Pietro de' Medici, in a chapel of the Medici, now Riccordi Palace, at Florence. The great work, however, on which G.'s fame rests, is the immense frescoes executed on the north wall of the famous cemetery, or Campo Santo of Pisa. This wonderful series of paintings, not inaptly termed by Vasari *una terribilissima opera* ("a terrific work"), was undertaken by the artist at the age of sixty, and accomplished in sixteen years. The scenes, which are all scriptural, are 24 in number, and are still in excellent preservation. G. died in 1485.

GRAAF, Regnier de, a celebrated Dutch physician, was born at Schoonhove in 1641, and died at Delft in 1673. He studied at the university of Leyden under

Digitized by Google

Dubois (De le Boé), who is better known under his Latinised name of Sylvius; and on the death of the latter, in 1672, would have been unanimously elected to the vacant chair, if his religion (he was a Catholic) had not proved an insuperable obstacle to his appointment. In 1664, when only twenty-three years of age, he published his "Disputatio Medica de Natura et Usu Succi Pancreatici," which although containing several errors—as, for instance, that the pancreatic juice is acid, and that many diseases, and especially intermittent fevers, are due to a morbid condition of this fluid—gained him a great reputation. After a short residence in France, where he took his doctor's degree at Angers in 1665, he returned to Holland, and settled at Delft, where his success in practice gained him much envy. He rendered great service to anatomy in being the inventor of those injections of the blood-vessels which Swammerdam and Ruysch brought to a state of comparative excellence, and which are at the present day the basis of our sound knowledge of most of the tissues of the body. He published several dissertations on the organs of generation in both sexes, which involved him in a prolonged and angry controversy with Swammerdam. According to Haller, his death was occasioned by an attack of jaundice, brought on by the excitement of this controversy, but we do not know Haller's authority for this assertion. All his works were collected in one octavo volume, and published under the title of "Opera Omnia" in 1677, and they were republished in 1678 and in 1705.

GRAAFF-REI'NET, the chief town of the division of its own name, is one of the most important and prosperous towns in Cape Colony. The number of inhabitants is about 3800. During the ten years immediately preceding 1857, it had risen from an inland village to be a great centre of commerce, having its public library, its college, its agricultural society, its banks, and its newspaper. It owes its advancement partly to its position on the high-road between Port Elizabeth and the northern boundary. It is situated on the Sunday, which enters Algoa Bay, near Port Elizabeth.

GRAAFIAN VESICLES. See OVARY.

GRAAL, Gral, Gral, or Gréal (derived probably from the old French, perhaps Celtic, *gréal*, Provençal, *grazal*, mediæval Latin, *gradalis*), signifies a kind of dish. In the legends and poetry of the middle ages, we find accounts of the Holy Graal—San Gréal—a miraculous chalice made of a single precious stone, sometimes said to be an emerald, which possessed the power of preserving chastity, prolonging life, and other wonderful properties. This chalice was believed to have been first brought from heaven by angels, and was the one from which Christ drank at the Last Supper. It was preserved by Joseph of Arimathea, and in it were caught the last dfope of the blood of Christ as he was taken from the cross. This holy chalice, thus trebly sanctified, was guarded by angels, and then by the Templiers, a society of knights, chosen for their chastity and devotion, who watched over it in a temple-like castle on the inaccessible mountain Montsalvage. The legend, as it grew, appears to have combined Arabian, Jewish, and Christian elements, and it became the favorite subject with the poets and romancers of the middle ages. The eight centuries of warfare between the Christians and Moors in Spain, and the foundation of the order of Knight Templars, aided in its development. The stories and poems of Arthur and the Round Table were connected with this legend. About 1170, Chrétien of Troyes, and after him other trou badours, sang of the search for the holy graal by the Knights of the Round Table, in which they met with many extraordinary adventures. Some have supposed that the story of the connection of the miraculous chalice with the Last Supper and the blood of Christ arose from a wrong division of the words *san gréal*, holy vessel, which were written *sang réal*, royal blood, blood of the Lord; but although the coincidence is curious, there is no good reason to suppose that a pun could have been the foundation of a superstition which spread over Europe. The legend of the graal was introduced into German poetry in the 18 c. by Wolfram von Eschenbach, who took Guiot's tales of Parcival and Titurel as the foundation of his poem, but filled it with deep allegorical meanings. It is more elaborately treated by the author of Titurel the Younger; and much curious information on the subject may be found in Lang's "Die Sage vom heiligen G." (1862), Cassel's "Der G. u. sein Name" (1865), Droysen's "Der Tempel des h. G." (1872), and Zarncke's "Der Graltempel" (1876).

GRABS, vessels of from 150 to 300 tons, employed on the Malabar coast. They are broad armed ships, with two or three masts, and unsuited for very heavy weather.

GRA'CCHUS is the name of a Roman family, of the gens Sempronia, which contributed several famous citizens to the state. First we have Tiberius Sempronius, who was consul in 238 B.C., and conducted some warlike operations in Corsica and Sardinia. Another Tib. Sempronius distinguished himself in the second Punic war, and for his success in opposing Hannibal, was honored with the consulship in 215 B.C., and again in 213 B.C. In those days of despondency, he did much to revive the spirit of the senate and people; with the allies, and 8000 *volones*, or volunteer slaves (who afterwards gained their liberty as a reward for their bravery), he withstood the Carthaginians in South Italy, defeated Hanno, and checkmated Hannibal himself; but after many victories, he at length lost his life, either in battle with Mago, or, according to others, by treachery. Hannibal honored him with a splendid funeral. Passing by some Gracchi of minor note, as the augur of 203 B.C., the tribune of 189 B.C., and others, we come to Tiberius Sempronius, the father of those two reformers and friends of the people whose fame has overshadowed all the others. He was born about 210 B.C., and for many years occupied a foremost position in the state. He was successively tribune, ædile, prætor, consul (twice), and censor, and distinguished himself in several wars. He introduced some important constitutional changes, and was often employed on foreign embassies, in which his judgment and conciliatory spirit were of great service to the state. He married Cornelia, the youngest daughter of P. Scipio Africanus, by whom he had twelve children. Nine of these died in youth; a daughter, Cornelia, married Scipio Africanus the younger. The history of his two sons follows:

1. Tiberius Sempronius Gracchus was born about 168 B.C., and was educated with great care by his excellent mother (his father having died while he was yet very young). He first saw military service under his brother-in-law, Scipio Africanus the younger, whom he accompanied to Africa. He was present at the capture of Carthage, and is said to have been the first of the Romans to scale the walls. In 137 B.C., he acted as quæstor to the army of the consul Mancinus in Spain, where the remembrance of his father's good faith and clemency was so fresh after forty years' interval, that the Numantines would treat with no other Roman but the son of their former benefactor. He was thus enabled to save from utter destruction an army of 20,000 Romans, who had been defeated, and were at the mercy of the Numantines. But the peace was considered by the aristocratic party at Rome as disgraceful to the national honor, and was repudiated, Mancinus being stripped naked, and sent back to the Numantines, that the treaty might thus be rendered void. Disgust and disappointment at this result are said by some, though without good reason, to have determined G. to espouse the cause of the people against the nobles; but a much more feasible ground for his conduct is to be found in the oppressed state of the commons at the time. Being elected tribune, he endeavored to reimpose the Agrarian Law of Licinius Stolo, and after violent opposition on the part of the aristocratic party, who had bribed his colleague M. Octavius Cæcina, he succeeded in passing a bill to that effect. (For a detailed account of the measure, see Agrarian Law.) Tiberius G., his brother Caius, and his father-in-law Ap. Claudius, were appointed triumvirs to enforce its provisions. Meantime, Attalus, king of Pergamus, died, and bequeathed all his wealth to the Roman people. G. therefore proposed that this should be divided among the poor, to enable them to procure agricultural implements, and to stock their newly acquired farms. It is said that he also intended to extend the franchise, and to receive Italian allies as Roman citizens. He also diminished the time which citizens were required to serve in the army. But fortune turned against the good tribune. He was accused of having violated the sacred character of the tribuneship by the deposition of Cæcina, and the fickle people in large numbers deserted their benefactor. At the next election for the tribuneship, his enemies used all their efforts to oust him; and a violent scuffle having arisen between the opposing factions, G. was slain, along with upwards of 300 others. His surviving friends were imprisoned, exiled, or put to death.

Caius Sempronius Gracchus, who was nine years younger than his brother, was possessed of much greater natural powers, and of more comprehensive views. His brother's death, which occurred while he was serving in Spain under Scipio

Digitized by Google

Africanus, deterred him for some years from entering into public life, and the nobles seeing his great abilities and fearing his influence with the people, endeavored to keep him as long as possible on foreign service in Sardinia and elsewhere. But at length he unexpectedly returned to Rome, being urged by his brother's shade, as was said, to enter on his great mission. Goaded by the persecution and groundless accusations of his enemies, he stood for the tribuneship, and was elected in 123 B.C. After bringing forward some measures to take vengeance on his brother's murderers, he set himself to carry out the agrarian law, which though not repealed, had by the machinations of the nobles been kept in abeyance. The two great aims of his legislation—viz., to improve the condition of the poor and to curtail the power of the senate and nobles—were now prosecuted with the utmost vigor and with unflinching steadiness of purpose. To develop the resources of Italy and at the same time to employ the poor, he made new roads throughout all parts of the country, repaired old ones, and erected milestones. By his zeal and by his unwearied industry in personally carrying out his own measures, even to superintending the execution of the public works, and by his affability and kindly good nature, he gained the esteem and approbation of all men with whom he came in contact. With the equites and the poorer classes, he was in special favor. But he at length fell, as his brother had done, by the intrigues of the nobles. One of his colleagues, M. Livius Drusus, was bribed by the opposite faction, and soon succeeded in undermining the influence of Caius by far surpassing him in the liberality of his public measures, and by his benefits to the commons. G. having stood for the tribuneship a third time, was rejected. Ultimately, by a series of moves, the history of which is too long for our space, violence was employed against Caius and his party—a fearful struggle took place in the streets of Rome, in which 3000 men are said to have perished. Many others were imprisoned and afterwards executed. Caius held aloof from the fight, but was at length compelled to seek safety in flight. He escaped to the grove of the Furies with a single slave, who first slew his master and then himself. The people saw when too late the folly of which they had been guilty in abandoning their best friend in the hour of need, and endeavored to atone for their crime by erecting statues to the brothers G., by declaring sacred the spots where their blood had been shed, and by offering sacrifices to them as to deities. Caius left a son, whose after fate is unknown.

GRACE is an expression frequently used in Scripture and in theological discussion. Its distinctive meaning is the idea of *free and unmerited* favor. According to Aristotle, this is the proper meaning of *charis* (Gr. grace), even when applied to man. It is a benefit springing out of the liberality and frechcartedness of the giver, and bestowed without any hope or expectation of reward. Applied to God in the New Testament and in theology, it denotes the free outcoming of his love to man; and when man, on the other hand, is said to be in a state of *grace*, it implies that he is in the enjoyment of this divine love and favor. St Paul draws a sharp contrast (Rom. xi.) between *charis* and *erga* (Gr. works), as mutually excluding one another. "And if by grace, then is it no more of works; otherwise grace is no more grace. But if it be of works, then is it no more grace; otherwise work is no more work."

Theologians have distinguished grace into *common* or *general*, and *special or particular*. *Common* grace is supposed to denote the love which God has to all His creatures, and the light of nature and of conscience which they all enjoy. *Special* grace is the love which God has for His elect people, and by which He saves them from their sins. This *special* or *saving* grace is sometimes also divided in various ways, and spoken of as electing, justifying, sanctifying grace: also in respect to man, as *imputed* or *inherent* grace—the grace, that is to say, of Christ's righteousness imputed or reckoned to the account of those that believe on Him, and the grace of holy and pious dispositions wrought in the heart by the spirit of God. Grace is also spoken of as *efficacious* and *irresistible*, and the relation in which the elect or believing people stand to God is represented as a *covenant of grace*, in contrast with the primitive relation which Adam bore to his Maker before the fall, which is called a *covenant of works*.

All these theological distinctions have arisen in the course of extended argument and discussion on divine truth. They are not to be found—at least in their more technical sense—in the New Testament. The *charis* of St Paul is not a logical

Digitized by Google

distinction, but a spiritual fact. It is the loving aspect of God towards the sinner—towards all sinners, whereby all who confess their sins have free access into His favor, and received the "adoption of sons." The technical distinctions of theology, however, are not without their value when rightly apprehended and interpreted. They mark the course of past controversy—they give precision to theological thought—and when not allowed to deface the simpler proportions of divine truth, they may teach needful and important lessons.

GRACE, Days of. See BILL.

GRACES, the goddesses of grace, favor, and gentleness, the sources of all grace and beauty, appear in Homer in indefinite numbers as the attendants of Cytherea (Venus), whom it is their office to bathe and anoint. Hesiod and most other poets mention three G.—Aglaia, Thalia, and Euphrosyne, the daughters of Zeus and Eurynome. Their worship is said to have been first introduced into Greece at Orchomenos, in Bœotia, by Eteocles. The Lacedemonians and Athenians originally recognised only two Graces, called, by the former, Phænna and Kleta; by the latter, Hegemone and Auxo. In the early ages, the G. were represented in elegant drapery; at a later period, slightly draped, or entirely nude. They appear holding each other by the hand, or locked in each other's embrace.

GRACIO'SA, one of the Azores Islands (q. v.), and the seventh of that group in population and importance.

GRADIENT. A tortoise walking is said, in Heraldry, to be gradient.

GRADIENT, a term used chiefly in connection with railways, to signify a departure of the line from a perfect level.

GRA'DUAL, in the Liturgy of the Roman and other Western churches, means that portion of the mass which intervenes between the epistle and gospel, and consists of a few verses of the Holy Scriptures, generally taken from the Psalms. It was originally called the "Responsum," or "Cantus Responsorius;" but, probably for the sake of distinguishing it from other portions of the service called by the same name, its present appellation has been substituted. The name "gradual" is derived from the place at which this response was chanted, and which was either the ambo, or chanting pulpit, which is approached by "steps" (*gradus*) or the "steps" themselves, whether of the ambo or of the altar. Originally, as we find from St Augustine, the gradual response consisted of an entire psalm, and in the mass of the first Sunday of Lent the entire of the 91st (90th in the Vulgate) psalm is chanted. In the Ambrosian Liturgy, the gradual is partly from the Old and partly from the New Testament. The gradual, in the Roman liturgy, is always followed by the "alleluia," except in penitential time, when a slow and mournful chant, called the "Tract," is substituted.

GRADUAL PSALMS, or "Psalms of the Steps," or "Songs of Degrees," a name given both by the Hebrews and in the Christian service-books to the fifteen psalms, 120—134 (119—133 in the Vulgate). The origin of this name is uncertain. The rabbins trace it to a fabulous incident connected with the building of the second temple; others explain it as an allusion to the fifteen steps by which (Ezekiel xl. 22—26) the temple was reached; others, again, regard these psalms as containing a prophetic allusion to the return from captivity, which, in the language of the Jews, was "a going up," the 134th psalm being the full outburst of exultation at the accomplishment of that great object of hope and longing. These psalms, in the Romish Church, form part of the office of each Wednesday during the Lent.

GRADUALE, the name given to the music of the above described portion of the Roman Liturgy. It is performed during mass after the epistle is read. It is said to have been used from the earliest times to allow the officiating priest time, during its performance, to take his place on the steps of the reading-desk, or on the steps of the gospel side of the altar. The music is according to the character of the words, and may be either an aria, duet, or chorus. The composition must not be long, as the priest has little ceremony to go through during its performance. The best specimens of the graduale are Haydn's "Insanæ et Vanæ Curæ;" "Salve Regina;" or Mozart's "Misericordias Domini;" "Sancta Maria;" "De Profundis," &c.

GRADUA'TION, the art of dividing mathematical, astronomical, and other in-

Digitized by Google

struments. The simplest problem in graduation is the dividing of a straight line, such as an ordinary scale or rule. This is commonly done by copying from a standard scale, for which purpose a dividing square and a suitable knife for cutting the divisions are used. The dividing square is a hard steel straight-edge, with a shoulder at right angles like a carpenter's square. This is made to slide along the standard scale, and halt at each required division, when a corresponding one is cut upon the rule, &c., by using the steel straight-edge as a guide to the knife. The *original graduation* of a straight line into equal divisions, as in making a first standard scale, &c., is performed either on the principle of *bisection* or *stepping*. In bisecting, the points of a beam-compass (see COMPASS) are adjusted to nearly half the length of the line to be divided; one point is then placed at one end of the line, and a faint arc struck towards the middle; this is repeated at the other end; the small distance between these arcs is then carefully bisected with the aid of a fine pointer and magnifier, which gives an accurate half of the line. The half thus obtained is again bisected in like manner, and these quarters bisected again, and so on until the required subdivision is attained. Stepping is performed with delicately pointed spring-dividers, which are set at once as nearly as possible to the opening of the small division required; then the points are made to step on, leaving at each step a very fine dot; and when it is found that the last dot either falls short of or overpasses the end of the line, the opening is adjusted accordingly, until perfect accuracy is obtained. Thus, if a line were divided into a thousand parts, and each division were 1-1000th too long or too short, the error would amount to a whole division at the end of a thousand steps. The method of bisection is practically the most accurate, and has been adopted by Graham, Bird, Ramsden, Troughton, and other eminent artists in original graduation. Curved lines are divided on this principle. The chord of an arc of 60° is equal to the radius; therefore, the opening of the compasses required for striking the circle gives this arc at once to start with. An arc 90°, or a quadrant, is obtained by bisecting 60°, and adding the half. By continual bisection of 60°, the finer graduations are produced. The amount of care, patience, skill, and delicacy of touch required in the original graduation of important astronomical instruments, is such, that not above one or two men in a generation have been found competent to the task, and these have become almost as famous as the astronomers who have successfully used the instruments. It would be out of place here to point out in detail the minute precautions and methods of correction that are adopted in this most delicate manipulation; but, as an example, we may mention the fact, that Graham, when dividing the mural quadrant for the Greenwich Observatory, measured his larger chords from a scale made for the purpose; but before laying these down on the quadrant, he left the scale, beam-compasses, and quadrant to stand for a whole night, in order to acquire exactly the same temperature, and that neglect of this precaution would have involved a notable amount of error. The necessity of such extreme accuracy will be understood when we consider the application that is made of these divisions. When, for example, the mariner determines his latitude by taking the meridian altitude of the sun, the graduated arc of the limb of the sextant or quadrant he uses represents, practically, the curved surface of the globe, and the error is magnified just to the same extent as the radius of the earth exceeds that of the divided arc of the instrument. Supposing this arc to be part of a circle of 60 inches' circumference, each degree will occupy 1-6th of an inch. An error of 1-100th of an inch in the division would thus mislead the mariner to an extent of more than four statute miles as regards his position on the waters. But such a ship's quadrant is but a coarse and rude instrument compared with astronomical instruments for measuring celestial angular distances by means of a divided arc; in these, an error of a thousandth part of an inch would be regarded as one of serious magnitude.

The methods of *original graduation* above described are not practically adopted except for the largest and most important astronomical or geodetical instruments. Ordinary instruments are graduated by dividing plates or engines which copy and adapt a set of already existing divisions. The dividing-plate which is used for common purposes, such as dividing compass rings, &c., is a divided circle with a steel straight edge, made movable on the axis or arbor of the plate in such a manner that its edge during every part of its revolution shall fall in the exact line from

Digitized by Google

centre to circumference. The ring, protractor, or other instrument to be divided, is clamped upon the plate with its centre exactly coinciding with that of the plate, and the straight-edge is moved round, and made to halt at the required divisions on the circumference of the dividing-plate, and by using the steel straight-edge as a guide, corresponding divisions are marked off upon the concentric arc of the instrument to be divided. *The dividing-engine* is a very complex machine, requiring the greatest accuracy and care in its construction; so much so, that the possession of a good one affords the means of obtaining a very good income, with a moderate amount of labor in using it. Such was the case with the instrument of Mr Parsons of London, who for many years divided a large proportion of the best theodolites, sextants, &c., that were made in this country. Among the most celebrated dividing-engines may be mentioned those of Ramsden, Troughton, Simms, and Ross. A detailed account of the construction of these would far exceed our limits. Their principal parts consist of a large circle divided with extreme care by original graduation. This wheel is racked on its edge with teeth as equal and accurate as the divisions; a very carefully constructed endless screw works in these teeth, and is moved through any given number of revolutions, or any measured fraction of a revolution, by means of a treadle or other suitable power, thus making the requisite steps for each division; another part of the machine cutting a fine line at the moment of the halt of each step.

These divisions are cut upon an arc of silver, gold, or platinum, which is soldered or inlaid upon the limb of the instrument, the precious metals being used, on account of the oxidation to which common metals are liable.

GRÆCIA, Magna. See MAGNA GRÆCIA.

GRAF, the German equivalent for Count (q. v.), *Comte*, Comes, and for our Earl (q. v.). The etymology of the word is disputed, but the most probable conjecture seems to be that it springs from the same root with the modern German *raffen* and the Anglo-Saxon *reafan*, to snatch or carry off hastily; and also with our words *reve*, *greve*, and the last syllable of *sheriff*. If this view be correct, the graf, in all probability, was originally a fiscal officer, whose duty it was to collect the revenue of a district. The title first appears in the *lex salica* (compiled in the 5th c.), under the Latinised form of *Grafio*; at a later period, the office is often designated by the Latin equivalent of *Comes*. Charlemagne divided his whole kingdom into Graf-districts (*Grafenyaue*) or counties, each of which was presided over by a graf. The people were in the habit of appointing a representative called the *Centgraf* to attend to their interests with the graf, and probably, if necessary, to appeal from his discisions to the central government. Then there was the *Stall-graf* or stable-graf; the *Comes Stabuli*, or constable of later times; the *Pfalz-graf* (*Comes Palatii*), who presided in the domestic court of the monarch, which as such was the highest court in the realm; the *Send-graf*, who was sent as an extraordinary deputy of the king to control the ordinary *gau-grafen*; and lastly, the *Mark-graf*, or marquis, on whom the important duty of defending the border-lands devolved. When feudal offices became hereditary, and the power of the princes of the empire, secular and ecclesiastical, developed itself, the graf gradually ceased to be an officer possessed of real power, and became merely a titled noble. In Germany, in modern times, there are two classes of grafs; those who are representatives of the old grafel families, who held sovereign jurisdiction immediately under the crown (*landesHoheit*), and who still belong to the higher nobility, their chief taking the title *Erlaucht* (Illustrious); and those who form the highest class of the lower nobility. The former is a very small, the latter, an extremely numerous class of persons.

GRA'FENBERG, a little village in Austrian Silesia, in an extension of the town of Freiwaldau towards the north, and is celebrated as the spot where the water-cure (see HYDROPATHY) was introduced about the year 1828 by Priesznitz. The village is situated at an elevation of 1900 feet above the level of the Baltic Sea; the climate is inclement, and the vegetation scanty. It extends from the valley, half way up the Gräfenberge. The lodgings for visitors are partly in the buildings connected with the baths, partly scattered on the declivity of the hill, or in Freiwaldau.

GRAFFI'TI (Ital. *graffito*, a scratching), a class of ancient inscriptions to which attention has recently been called, and of which several collections have been made,

Digitized by Google

or are in progress. The graffito is a rude scribbling or scratching with a stylus, or other sharp instrument, on the plaster of a wall, a pillar, or a door-post. Such scribblings are pretty commonly found on the substructions of Roman ruins, as in the Golden House of Nero, the palace of the Cæsars and the Palatine, and in still greater numbers in Pompeii and in the Roman catacombs. Their literary value, of course, is very slight; but as illustrating the character and habits of a certain class of the ancient Romans, and what may be called the "street-life" of the classic period, they are deserving of study. A small selection of Pompeian graffiti was published in 1837 by Dr Wordsworth; but the most complete, or, at all events, the most popular collection, is that of Padre Garrucci, a Neapolitan Jesuit, which was published in Paris in 1856. Greek graffiti occasionally are found upon Roman ruins, but they are commonly in Latin, and in a few instances at Pompeii, in the ancient Oscan. A few specimens may not be uninteresting.

Some of them are idle scribblings, such as we may suppose some loiterer to indite at the present day; thus, some lounger at the door of a wine-shop at Pompeii amuses himself by scratching on the door-post the tavern-keeper's name—*Taberna Appii* ("Appius's Tavern." In other cases, we meet with some scrap of rude pleasantry or scandal, such as not unfrequently defaces the walls of our own towns or villages; thus, *Auge amat Arabienum* ("Auge is in love with Arabienus.") Many rude sketches also are found upon the walls, some of them evidently caricatures, others seriously meant, and grotesque from the extreme rudeness. A great many of the subjects of those sketches are gladiatorial.

By far the largest proportion of the graffiti are from Pompeii, but many have also been discovered at Rome, and some of them are of a most interesting character. One discovered by Father Garrucci in 1856, in a subterranean chamber of the palace of the Cæsars, possesses a strange and truly awful interest, as a memorial of the rude early conflicts of paganism with the rising Christian creed. It is no other than a pagan caricature of the Christian worship of our Lord on the cross, and contains a Greek inscription descriptive of one Alexamenus as engaged in worshipping God. The chamber in which it was found appears to have been a waiting-room for slaves and others of inferior grade.

The graffiti of the catacombs are almost all sepulchral, and are full of interest as illustrating early Christian life and doctrine. See for the whole subject the "Edinburgh Review," vol. cx. pp. 411—437.

GRÄFRATH, a town of Rhenish Prussia, in the government of Düsseldorf, and 12 miles east-by-south from Düsseldorf, on the Itter. It has manufactures of cotton goods, silk ribbons, and iron-ware; and has recently much increased in manufacturing industry, wealth, and population. Pop. (1871) 5420.

GRAFTING, the uniting of a young shoot (*scion*) of one kind of plant to a stem (*stock*) of another kind, so that the scion may receive nourishment from the stock. Grafting has been practised from ancient times, as may be seen from passages in the New Testament, and in Virgil and other Latin classics; although it cannot be certainly traced to a more remote antiquity; and its introduction among the Chinese is ascribed to Roman Catholic missionaries. It is a most important part of the art of gardening, and is practised for various purposes, but chiefly for the perpetuation and propagation of the finest varieties of fruit-trees, which could not be accomplished by seed, and is accomplished by grafting more rapidly and easily than by layers or cuttings. Besides this, however, grafting is of great use in hastening and increasing the fruitfulness of fruit-trees; the circulation of the sap being impeded at the junction of the stock and scion—as by a deep wound, removal of bark, or the like—more particularly when there is a considerable difference between the stock and scion; and repeated grafting (technically, *working*) is often resorted to by gardeners to obtain flowers and fruit much sooner than would naturally be the case. Grafting is also employed to turn to account the vigor of a root and stem of which the branches are exhausted or otherwise unproductive, and large crops of fruit may often be thus obtained in a garden, much sooner than by any other means.

In grafting, it is particularly to be attended to that the *Alburnum* (q.v.) of the scion is brought into contact with that of the stock. The hard wood of the one never unites with that of the other, remaining separate and marking the place of the operation even in the oldest trees. For scions or grafts, pieces of about six to eight

Digitized by Google

inches long are generally taken from the shoots of the previous summer, with several buds, but portions of shoots of two years old are sometimes successfully employed. The time for grafting is in spring, as soon as the sap begins to appear. The scion should, if possible, be taken from a healthy and fruitful tree, but scions from the extremities of lateral branches are more likely to become speedily fruitful than those from the uppermost branches, where growth is most vigorous. The scion should be kept for a few days before grafting, so that the stock may rather exceed it, not only in vigor, but in the progress of its spring growth; and for this purpose may be placed in the ground, in a rather dry soil, sheltered from the direct rays of the sun. Scions may be kept for some time, and easily carried to a distance, by sticking their lower end into a potato. The end should always be freshly cut off when the scion is to be used. There are various modes of grafting. *Cleft-grafting* is very commonly practised when the stock is very considerably thicker than the scion. The stock being cut over, is cleft down, and the graft, cut into the shape of a wedge at its lower end by a sharp thin knife, is inserted into the cleft. This mode of grafting is particularly applicable to branches of large trees, when the introduction of a new variety of fruit, or increased fruitfulness, is sought.—*Crown-grafting* is used for still thicker stocks, which are cut across, and then cleft down by two clefts crossing one another at right angles, two scions being inserted close to the bark in each cleft; or no cleft at all is made, and any desired number of scions obliquely cut away on one side are simply inserted between the bark and wood of the stock, the operation in this case being deferred till the bark readily parts from the wood. In this kind of grafting, a longitudinal slit in the bark of the stock, opposite to each graft, is advantageous.—*Tongue-grafting* is the mode most commonly practised for young trees in nurseries. For this, it is necessary that the stock and the scion should be of not very different thickness. A slit or a very narrow angular incision is made in the centre of the stock downwards, and a similar one in the scion upwards, both having been first cut obliquely, at corresponding angles, and the tongue thus made in the scion being inserted into the incision in the stock, they are fastened very closely and thoroughly together.—In *Saddle-grafting*, the end of the stock is cut into the form of a wedge, and the scion is affixed to it, the base of the scion having been cut or slit up for the purpose.—*Shoulder-grafting* used chiefly for ornamental trees, is performed by cutting obliquely, and then cutting across a small part at top of the stock, so as to form a shoulder, the scion being cut to fit it.—*Peg-grafting*, not now much in use, is accomplished by making the end of the scion into a peg, and boring the top of the stock to receive it.

Whichever of these modes of grafting is adopted, the graft must be fastened in its place by tying, for which purpose a strand of bast-matting is commonly used. The access of air is further prevented by means of clay, which has been worked up with a little chopped hay, horse or cow dung, and water, and which is applied to the place of junction so as to form a ball, tapering both upwards and downwards. In France, a composition of 28 parts black pitch, 28 Burgundy pitch, 16 yellow wax, 14 tallow, and 14 sifted ashes, is generally used instead of clay. Gutta-percha, applied in a soft state, has also been used, or even blotting-paper held fast by stripes of sticking-plaster. The progress of the buds shews the union of the graft and stock, but it is not generally safe to remove the clay in less than three months; and the ligatures, although then loosened, are allowed to remain for some time longer. From some kinds of fruit-trees, fruit is often obtained in the second year after grafting.

Budding (q. v.) is in principle the same as grafting; and *Flute-grafting* is a kind of budding in which a ring of bark is used instead of a single bud, and a stock of similar thickness having been cut over, a ring of bark is removed, and the foreign one substituted. This is commonly performed in spring, when the bark parts readily, and is one of the surest modes of grafting.—*Inarching* (q. v.), or *grafting by approach*, in which the scion is not cut off from its parent stem until it is united to the new stock, is practised chiefly in the case of some valuable shrubs kept in pots, in which success by the ordinary methods is very doubtful.

An effect is produced by the stock on the scion which it nourishes analogous to that of a change of soil; much of the vigor of a strong healthy stock is also communicated to a scion taken even from an aged tree. There is, moreover, in some degree, an influence on the elaborated sap descending from the scion on the stock

Digitized by Google

which supports it. An important part of the practical skill of the gardener or nurseryman consists in the selection of the proper kinds of stocks for different species and varieties of fruit-trees. The stock and scion, however, must not be of species extremely dissimilar. No credit is due to the statements of ancient authors about vines grafted on fig-trees, apples on planes, &c., the semblance of which can only have been brought about by some delusive artifice; for all attempts at grafting fail except among plants of the same genus, or at least of the same natural family.

Herbaceous plants with firm stems, as dahlias, are sometimes grafted. Some kinds of plants, of small size, in pots, are placed in moist hothouses or hotbeds, under bell-glasses, whilst the junction of the scion and stock is going on, which in these circumstances takes place very surely and very expeditiously. But an accumulation of too much moisture under the bell-glass must be guarded against.

GRAGNA'NO, a town of 8000 inhabitants, in the province of Naples, two miles south-east of Castellamare, is situated on the flank of Mount Gaurano, from which it is said to have derived its name. The origin of this town dates from the great eruption of Vesuvius in 79 A.D., when the inhabitants of Stabia, in dread of the vicinity of the volcano, fled from their dwellings, and sought refuge on the mountain of Gaurano. G. lies in a beautifully picturesque neighborhood, which produces excellent wines, and has good macaroni manufactories.

GRAHAM, Family of. See MONTROSE.

GRAHAM, Sir James Robert George, the Right Honorable, of Netherby, Cumberland, statesman, eldest son of Sir James, the first baronet, by Lady C. Stewart, eldest daughter of the seventh Earl of Galloway, was born June 1, 1792. The Grahams of Netherby are a junior branch of the Grahams of Esk, Viscounts of Preston, descended from the Earls of Strathearne and Menteith. G. was educated at Westminster School, whence he proceeded to Queen's College, Cambridge. He afterwards became private secretary to Lord Montgomerie, the British minister in Sicily, during the most critical period of the war, and the entire management of the mission devolved upon him at a most important moment, in consequence of the illness of his chief. On the arrival of Lord W. Bentinck he was continued in his post, and he afterwards accepted a military situation attached to the person of Lord William, who was commander-in-chief in the Mediterranean. He was sent in this capacity to Murat, with whom at Naples he negotiated the armistice which separated that general from Napoleon. In 1818 he was returned for Hull on Whig principles, but at the next election in 1820 lost his seat, and some years elapsed before he re-entered parliament. In 1824 he succeeded to the baronetcy on the death of his father. In 1826 he was returned for Carlisle as a Whig and a warm supporter of Catholic emancipation. He displayed so much ability in opposition, that Earl Grey offered him in 1830 the post of First Lord of the Admiralty, with a seat in the cabinet. He was also one of the committee of the cabinet appointed to discuss and settle the provisions of the first Reform Bill. He was at this time very popular with the extreme liberal party, and was supposed to be, of all the members of the Grey cabinet, most favorable to radical changes. In 1834 he seceded from the government with Mr Stanley, on the appropriation clause of the Irish Church Temporalities Act. He refused to join the Peel administration in that year, but gradually in opposition approximated to the politics of that statesman; and in 1841 became Secretary of State for the Home Department in the government of Sir Robert Peel, who on one occasion declared that G. was the ablest administrator and the best man of business he had ever known. In 1844, he issued a warrant for opening the letters of Mazzini, and caused the information thus obtained to be communicated to the Austrian minister, an act by which the ministry, and G. in particular, incurred great obloquy. He also encountered great displeasure north of the Tweed by his high-handed method of dealing with the Scottish Church during the troubles which ended, contrary to his anticipation, in the Disruption, and the formation of the Free Church. He gave Peel a warm support in carrying the Corn Law Repeal Bill, and resigned office with his chief as soon as that great measure was carried. On the death of Peel in 1850, he became leader of the Peelite party in the Lower House, and led the opposition to the Ecclesiastical Titles Bill. In December 1852 he took office in the Coalition Ministry of the Earl of Aberdeen, and

Digitized by Google

accepted his old office of First Lord of the Admiralty. This was a post much below his talents and pretensions, but he held it until February 1855. G. refused to take office either in the first or second administration of Lord Palmerston, but he gave that minister a general support. He died from disease of the heart, October 25, 1861. When the House of Commons again met, it felt that it had lost one who stood in the first rank of statesmen. His commanding stature, fine personal presence, his calm and impressive delivery, his ripe and gentle wisdom, poured forth in a stream of quiet, yet winning and persuasive eloquence, made him the Nestor of the House of Commons. Yet his changes of opinion, from the Whiggism of his youth to the vehement Conservatism of his manhood, and the Radicalism of his old age, exposed him to incessant and well-founded charges of political inconsistency.

GRAHAM, John, Viscount Dundee, was the eldest son of Sir William Graham of Claverhouse, head of a branch of the noble family of Montrose, in Forfarshire. He was born in 1648, entered St Andrews university in 1665, served in the French army from 1668 till 1672, next entered the Dutch service as cornet in the Prince of Orange's horse guards, and is reported (but on no good authority) to have saved the life of the prince at the battle of Seneffe in 1674. Returning to Scotland, he obtained (February 1678) an appointment as lieutenant in a troop of horse commanded by his cousin, the third Marquis of Montrose. At this time, the government of Charles II. was engaged in its insane attempt to force Episcopacy upon the people of Scotland. A system of fines and military coercion had been carried on for years against all Nonconformists; conventicles and field-preachings were prohibited, penalties were inflicted on all who even harbored the recusants, and the nation lay at the mercy of informers. Maddened by oppression, and fired by a fierce zeal for the Covenant, the people flew to arms; but their efforts were irregular and detached, and each successive failure only aggravated their sufferings. Many were executed, the jails were filled with captives, and those who fled were outlawed, and their property seized. In this miserable service, G. now engaged. He encountered an armed body of Covenanters at Drumclog, June 1, 1679, but was defeated, about forty of his troopers being slain, and himself forced to flee from the field. Three weeks afterwards (June 22), he commanded the cavalry at Bothwell Bridge, where the royal forces, under the Duke of Monmouth, achieved an easy victory over the Covenanters. In this battle, three or four were killed while defending the bridge, but in the pursuit, 400 were cut down (chiefly by G.'s dragoons), and 1200 surrendered unconditionally, to be afterwards treated with atrocious inhumanity. These affairs at Drumclog and Bothwell are the only contests that can even by courtesy be called battles in which G. was engaged in Scotland previous to the abdication of James II. They gave no scope for valor, and displayed no generalship. In his other duties—pursuing, detecting, and hunting down unyielding Covenanters—G. evinced the utmost zeal. He rose to the rank of major-general, was sworn a privy councillor, had a gift from the crown of the estate of Dudhope, and was made constable of Dundee. In 1688, on the eve of the Revolution, he was raised to the peerage by James II. as Viscount Dundee and Lord Graham of Claverhouse. When the bigotry of James had driven him from the throne, Dundee remained faithful to the interests of the fallen monarch. He was joined by the Jacobite Highland clans and by auxiliaries from Ireland, and raised the standard of rebellion against the government of William and Mary. After various movements in the north, he advanced upon Blair in Athol, and General Mackay, commanding the government forces, hastened to meet him. The two armies confronted each other at the Pass of Killiecrankie, July 27, 1689. Mackay's force was about 4000 men; Dundee's, 2500 foot, with one troop of horse. A few minutes decided the contest. After both armies had exchanged fire, the Highlanders rushed on with their swords, and the enemy instantly scattered and gave way. Mackay lost by death and capture 2000 men; the victors, 900. Dundee fell by a musket-shot while waving on one of his battalions to advance. He was carried off the field to Urrard House, or Blair Castle, and there expired. In the Bodleian Library, Oxford, is preserved the letter-book of Nairne, private secretary to James II., and in this book is the copy of a letter purporting to be written by Dundee after he had received his death-wound, giving James a short account of the victory. The letter was first published in Macpherson's "Original Papers," 1775, and has been treated as a forgery; but Nairne could have had no con-

Digitized by Google

ceivable motive for forging such a document, which remained unprinted above eighty-years.

The character and services of Dundee have been greatly exaggerated and blackened by party spirit. With the Jacobites, he was the brave and handsome cavalier, the last of the great Scots and gallant Grahams. With the Covenanters, he was "bloody Claverse," the most cruel and rapacious of all the mercenary soldiers of that age. He was neither the best nor the worst of his class. As a military commander, he had no opportunities for display. He was the hero of only one important battle, and in that his skill was shewn chiefly in his choice of position. As a persecutor, he did not, like Dalyell, introduce the thumb-screw, nor, like Grierson of Lagg, drown helpless women at stakes on the seasands. "In any service I have been in," he said, "I never inquired further in the laws than the orders of my superior officers;" and in Scotland he had very bad superior officers—low-minded, cruel, relentless taskmasters. It was fortunate for his reputation that he died after a great victory, fighting for an exiled and deserted monarch. This last enterprise has given a certain romantic interest to his name and memory.

GRAHAM, Thomas, a celebrated chemist, was born in Glasgow in the year 1805. Having studied at Glasgow and Edinburgh, he became, in 1830, Professor of Chemistry at the Andersonian University, and continued in that office till 1837, when he succeeded Dr Turner in the chemical chair of University College, London. In 1855, he was appointed Master of the Mint, and resigned his professorship. From the year 1831, in which his memoir, "On the Formation of Alcoates, Definite Compounds of Salts and Alcohol," appeared in the "Transactions of the Royal Society of Edinburgh," to the time of his death, he was constantly publishing important contributions to chemistry. Amongst the most important of his memoirs we may mention the following: "On the Law of Diffusion of Gases" ("Tr. R. Soc. Edin." 1834); "Researches on the Arseniates, Phosphates, and Modifications of Phosphoric Acid" ("Phil. Tr." 1833); "On the Motion of Gases, their Effusion and Transpiration" ("Ibid," 1846 and 1849); "On the Diffusion of Liquids" ("Ibid," 1850 and 1851); "On Osmatic Force" ("Ibid." 1854); "Liquid Diffusion Applied to Analysis," and "On Liquid Transpiration in Relation to Chemical Composition" ("Ibid." 1861). In addition to these memoirs, he brought out an excellent treatise on Chemistry, which has passed through more than one edition. G. was one of the founders and first President of the Chemical and Cavendish Societies, was a Fellow of the Royal Society, and was more than once appointed one of its vice-presidents. He was likewise frequently placed by government on important scientific commissions. He died 16th September 1869.

GRAHAME, James, a Scottish poet, son of a legal practitioner, was born in Glasgow, April 22, 1765, and was educated at the university of that city. He removed to Edinburgh in 1784, where he commenced the study of law under the tuition of a relative, and was admitted a member of the Society of Writers to the Signet in 1791, and in 1795, of the Faculty of Advocates. Finding the legal profession unsuited to his tastes, and having a sufficiency of worldly means, he withdrew from professional practice and devoted himself to the cultivation of his muse. He had long regarded the life and duties of a country clergyman with a wistful eye, and an opportunity offering, he took orders in the Church of England, being ordained by the Bishop of Norwich on Trinity Sunday, the 28th May, 1809. He was successively curate of Shipton in Gloucestershire, and of Sedgefield in the county of Durham. Ill-health compelled him to abandon his sacred duties, and he returned to Scotland; spending a few days in Edinburgh, he proceeded to Glasgow, and died at his brother's residence, near that city, on the 14th September, 1811, in the forty-seventh year of his age.

G. has left behind several poetical works, the chief of which are—"Mary, Queen of Scots," a dramatic poem; "The Sabbath;" "The Birds of Scotland;" and "The British Georgics." It is on "The Sabbath" that his fame rests. He was a retiring, amiable, and affectionate man, and possessed a deep love for nature, and those passages in his poems are the best that give utterance to that love. There was nothing bold or mounting in his genius, but he had a plenteous command of musical verse and rural imagery.

GRAHAME'S or Hotham's Island. A mass of dust, sand, and scoriæ thrown

Digitized by Google

out of a submarine volcano in the Mediterranean, and which remained for some time above the surface of the water, received these names. It made its appearance about thirty miles off the coast of Sicily, opposite to Sciacca, in July 1831. In the beginning of August, when the action of the volcano had ceased, it had a circumference of about a mile and a quarter, the highest point was estimated at 170 feet above the sea, and the inner diameter of the crater about 400 yards. As soon as the eruption ceased, the action of the waves began to reduce the island, and before many months transpired, the whole mass of scoriæ and sand disappeared, being scattered as a stratum of volcanic cinder in that portion of the bed of the Mediterranean.

GRAHAM'S LAND, an island of the Antarctic Ocean, discovered by Biscoe in February 1832, lies in lat. 64° 45′ s., and long. 68° 51′ w., being nearly on the meridian of the east extremity of Tierra del Fuego, and within a comparatively short distance of the polar circle. The position, as above defined, is precisely that of Mount William, the highest spot seen. In front, towards the north, are a number of islets, called Biscoe's Range. No living thing, excepting a few birds, appears to exist.

GRAHAM'S TOWN, the capital of the eastern province of the Cape Colony, stands near the centre of the maritime division of Albany. It is about 25 miles from the sea, in lat. 33° 19′ s., and long. 26° 31′ e.; and it contains about 8000 inhabitants, chiefly English. G. T. is the see of two bishops—one of the Church of England, and another of the Church of Rome—and possesses a cathedral. It has also several Wesleyan ministers, besides the pastors of the Dutch Reformed Church. Among the other institutions of the place are its banks, insurance offices, a botanic garden, a public library, a general hospital, large barracks, and two newspapers.

GRAIN (Lat. *granum*, any small hard seed or particle), a term often used as equivalent to *corn*, denoting the seeds of the *Cerealia*.

GRAIN COAST. See GUINEA.

GRAINES D'AVIGNON. See FRENCH BERRIES.

GRAINING (*Leuciscus Lancastriensis*), a fish of the family *Cyprinidæ*, of the same genus with the Dace (q. v.), which it much resembles. It was first pointed out as a different species by Pennant, who found it in the Mersey. It occurs in a few English streams, and in some of the lakes of Switzerland. It is rather more slender than the dace. In its habits and food it resembles the trout, rises readily at the artificial fly, and affords good sport to the angler.

GRAINS OF PARADISE, or Melegnetta Pepper, an aromatic and extremely hot and pungent seed, imported from Guinea. It is the produce of *Amomum Melegnetta*, or *A. Grana Paradisi*, a plant of the natural order *Scitamineæ* or *Zingiberaceæ*, with lanceolate leaves, one-flowered scapes (leafless stems), about three feet high, and ovate or elliptic-oblong capsules containing many seeds. By the natives of Africa, these seeds are used as a spice or condiment to season their food; in Europe, they are chiefly employed as a medicine in veterinary practice, and fraudulently to increase the pungency of fermented and spirituous liquors. By 56 Geo. III. c. 58, brewers and dealers in beer in England are prohibited, under a heavy penalty, from even having grains of paradise in their possession. This drug is much used to give apparent strength to bad gin. The name Melegnetta Pepper, or Guinea Pepper (q. v.), is also given to other pungent seeds from the west of Africa.

GRAKLE, the common name of many birds of the Starling family (*Sturnidæ*), all tropical or sub-tropical. They have very much the habits of starlings, and some of them even excel starlings in their imitative powers, and particularly in the imitation of human speech. This is remarkably the case with Mina Birds (q.v.) of the East Indies, which may be regarded as grakles. Numerous species inhabit Africa. Some of them are birds of splendid plumage. The PARADISE G. (*Gracula gryllivora*) of India has acquired a peculiar celebrity as a destroyer of locusts and caterpillars. It is about the size of a blackbird. Buffon tells us, that in order to stop the devastations of locusts in the island of Bourbon, this bird was introduced from India by the government. The grakles, however, beginning to examine the newly-sown fields, excited the alarm of the planters, and were exterminated: but it was

Digitized by Google

found necessary, after a few years, again to introduce them, and they are now very numerous, although they do not confine themselves to insect food, but in default of it are ready to betake themselves to seeds and fruits. They sometimes enter pigeon-houses and feed on the eggs, or even on the newly-hatched young. When tamed, they become very pert and familiar, and exhibit a great aptitude for imitating the voices of animals. A G. of this species, kept in a farmyard, has been known to imitate most of its ordinary sounds, as those of dogs, sheep, pigs, and poultry.—Some of the grakles are known as summer birds of passage in the northern parts of America.

GRA'LLÆ, or Grallato'res (Lat. stilt-walkers), an order of birds, generally characterised by very long legs, the *tarsus* (shank) in particular being much elongated, and by the nakedness of the lower part of the tibia, adapting them for wading in water without wetting their feathers. They have also generally long necks and long bills. The form of the bill, however, is various; and in its size, strength, and hardness, it is adapted to the kind of food; some, as snipes, which feed chiefly on worms and other soft animals, having a very soft weak bill, whilst others, which feed on larger and stronger animals, have the bill proportionately large and strong. The form of the body is generally slender. The greater number of the G. are inhabitants of the sea-coast or of marshy districts. Many are birds of passage. Even those which are not aquatic are generally driven from the districts which they frequent either by frost or drought. Cuvier divided this order into *Brevipennes* (q. v.), (Ostrich, Cassowary, Emu, &c.); *Pressirostres* (Bustards, Plovers, Lapwings, &c.); *Cultrirostres* (Cranes, Herons, Storks, Adjutants, Spoonbills, &c.); *Longirostres* (Snipes, Curlews, Godwits, Sandpipers, &c); and *Macrodactyli* (Rails, Crakes, Coots, &c.). The *Brevipennes* are constituted by some into a distinct order, *Cursores*, and differ very widely in many respects from the true Grallæ.

GRAM. See CHICK PEA.

GRAMI'NEÆ. See GRASSES.

GRAMMAR, in its usual sense, and as applied to a particular language, investigates and systematises the facts of that language, as exhibited in the most approved writers and speakers; the main divisions or heads being: (1) the way in which the sounds or spoken words are represented by letters (Orthography); (2) the division of words into classes, or "parts of speech," the changes or inflections they undergo, their derivation and composition (Etymology); and (3) the way in which they are joined together to form sentences (Syntax). A book embodying the results of such investigations, with a view to enable learners to understand a language, and to use it properly, is a grammar of that language.

Languages were not originally constructed according to rules of grammar previously laid down; but grammar rules were deduced from languages already in existence. In the days of Plato, perhaps the greatest master of language that ever wrote, the division of words into classes or parts of speech had not yet been made. Plato himself, according to Max Müller, took the first step in formal grammar by making the distinction of noun and verb, or rather of subject and predicate; for it was a distinction in the ideas or elements of a proposition he was making, rather than in the words themselves. Aristotle and the Stoic philosophers made further advances in the analysis of language, but they attended little to the forms of words, their object being logical rather than grammatical (see GENITIVE). It was the Alexandrian scholars, engaged in preparing critical editions of Homer and the other Greek classics, who first analysed, classified, and named the phenomena of language as language; and it was one Dionysius Thrax, who had been trained in the Alexandrian school, and became a teacher of Greek (*Grammaticus*, from Gr. *gramma*, a letter; and those who taught boys their Roman letters were called *Literatores*) at Rome, that published the first practical systematic Greek grammar for the use of his Roman pupils (about 80 B. C.). This work, which still exists, though much interpolated, became the basis of all subsequent grammars, both Greek and Latin; and when grammars of the modern European tongues came to be written, they naturally followed the classical models. The chief matters treated of in grammar are considered under such heads as ADJECTIVE, CONJUNCTION, DECLENSION, &c.

In quite recent times, the study of language has advanced beyond this empirical stage, in which its object was confined to the explaining and teaching individual

Digitized by Google

languages; and, under the name of "Comparative Grammar," has brought to light the resemblances and differences of the various languages of the world, so as to classify them, after the manner of natural history, into families and minor groups, according to their greater or less affinities. Still higher questions, entering into the origin and growth of speech, and seeking to give a scientific account of its phenomena, now occupy the more advanced students of this subject. See LANGUAGE, INFLECTION.,

GRAMMAR SCHOOLS received their name at a time when the English language was not written, and when all knowledge of the principles of language could be obtained only through a study of the grammar of the ancient tongues, particularly Latin. The idea which lay at the basis of these institutions still pervades them, and the ancient languages are the principal subjects of instruction. History, geography, and modern languages have of late years been admitted into the curriculum of the great majority of these schools; but these subjects still hold a subordinate place, and distinction in Latin and Greek gives pre-eminence, and is the great object of ambition both to masters and pupils. Nor can in be otherwise so long as the universities recognise the ancient tongues as the only sound basis of a liberal education. For a further notice of the grammar schools of Great Britain, see PUBLIC SCHOOLS, NATIONAL EDUCATION.

GRAMME is the standard unit of French measures of weight, and is the weight of a cubic centimètre of distilled water at 0° Centigrade (corresponding to 32° Fah.); the other weights have received names correspondiug to the number of grammes they contain, or the number of times they are contained in a gramme: in the former case, the Greek numerals deca, hecto, kilo, myria, expressing weights of 10 grammes, 100 grammes, 1000 grammes, 10,000 grammes; in the latter case, the Roman numerals deci, centi, are prefixed, to express tenths, hundredths of a gramme. Starting from the relation between the English yard and the French mètre, we are enabled to compare the units of weight, and it is found that a gramme = 15·4324S grains Troy, from which the equivalents in English measure for the other weights can easily be found: thus—

	Grains Troy.		Lbs. Avoirdupois.	
Centigramme —	·1543234	—	·0000220462	
Decigramme —	1·543234	—	·000220462	
GRAMME —	15·43234	—	·00220462	
Decagramme —	154·3234	—	·0220462	
Hectogramme —	1543·234	—	·220462	
Kilogramme —	15432·34	—	2·20462	
Myriagramme —	154323·4	—	22·0462	= ·19684 cwt.
Quintal (q. v.) —	1543234	—	220·462	= 1·9684 "

GRAMMONT, a small town of Belgium, in the province of East Flanders, is situated on both banks of the Dender, 20 miles south-south-east of Ghent. It has manufactures of lace, fine linen, damask and woollen fabrics, and tobacco; and carries on cotton-spinning, dyeing, bleaching, tanning, distilling, and brewing. Pop. (1870) about 9000.

GRAMMONT, or Gramont, Philibert, Count of, a celebrated French courtier, son of Anthony, Duke of Grammont, was born about 1621. While still very young, he served as a volunteer under Condé and Turenne, and distinguished himself by the most chivalric bravery. At the court of Louis XIV., with this reputation added to his youth, noble birth, a handsome person, fine talents and accomplishments, a lively wit, and strangely good-fortune at play, at which he won such amounts as to support even his extravagant expenditures, it is no wonder that he became a favorite. He was distinguished for his gallantries, and even had the audacity to aspire to be the rival of the king in the affections of one of his favorites. This caused him to be banished from France; and he found a pleasant refuge and congenial society in the gay and licentious court of Charles II. of England. Here, after many adventures, he engaged to marry Eliza Hamilton, sister of Anthony, Count Hamilton, but slipped out of London without fulfilling his promise. Two of the lady's brothers set off in pursuit of the forgetful Frenchman, and coming up with him at Dover, asked him "if he had not forgotten something." "Oh, to be sure," replied G., "I have forgotten to marry your sister;" and returned to London to complete his en-

Digitized by Google

gagement. He then went to France, where his wife became one of the ladies of the court of Maria Theresa of Austria. By this marriage he had two daughters, one of whom was married to Henry Howard, Marquis of Stratford, and the other became Abbess of Pousay, in Lorraine. He died in 1707. See "Memoirs of the Comte de Grammont" by his brother-in-law, Anthony, Count Hamilton (edited by Sir Walter Scott in 1811; reprinted in Bohn's "extra volumes").

GRA'MPIANS, the name of the principal mountain system in Scotland. The system runs from north-east to south-west, forming the well known high grounds of Aberdeenshire, Kincardineshire, Forfarshire, and Perthshire. The average elevation of the summits of this main range is from 2000 to 3000 feet, and the highest elevation reached is that of Ben Nevis (4406 feet) at its western extremity. An outlying branch of the G. extends northward from near the head of the valley of the Dee, and comprises among its chief summits Ben Muicdhui (4295 feet) and Cairngorm (4083 feet). Southward of the western extremity of the G. are situated numerous groups and chains of greater or less extent. Among these the chief summits are Ben Cruachan (3633 feet), Ben Lomond (3192 feet), Ben More (3843 feet), Ben Lawers (3984 feet), and Schiehallion (3547 feet).

GRAMPIANS, mountains in Australia, run north and south in the west part of Victoria, stretching in s. lat. from 36° 52′ to 37° 38′, and in e. long. from 142° 25′ to 142° 47′. From their eastern slope flow the Glenelg and its affluents. The loftiest peak of the range, Mount William, is 4500 feet high above the sea.

GRAMPUS (probably from the French, *Grand poisson*, great fish), a cetaceous animal, common in the arctic seas, as on the coasts of Greenland and Spitzbergen, not unfrequent in the Atlantic, and well known on the British coasts. It is one of the *Delphinidæ*, or Dolphin family, and is commonly referred by naturalists to the same genus with the porpoise, under the names *Phocæna Orca*, *P. Grampus*, and *P. gladiator*, although a new genus, *Grampus*, has also been proposed for it. It is the largest of the *Delphinidæ*, often more than twenty feet in length; its form spindle-shaped, but thicker in proportion than the porpoise, from which it also differs in the much greater height of its dorsal fin, in the upper jaw projecting a little over the lower, and in the smaller number of teeth, which are about eleven on each side in each jaw. The tail is powerful; in a specimen twenty-one feet long, it was found to be seven feet broad. The G. is generally seen in small herds. It is very voracious, and pursues salmon up the mouths of rivers as far as the tide reaches. Marvellous stories are told of attacks which it makes on the whale, and of its tearing out and devouring the whale's tongue, but even the least improbable require confirmation. The G. possesses great strength and activity.

GRAN (Mag. *Esztergam*), a town of Hungary, is finely situated on an elevation on the right bank of the Danube, 25 miles north-west of Pesth. It is a royal free-town, is the see of the primate of Hungary, has a large cathedral, and is rich in fine buildings. Pop. (1869) 8780. G., which is one of the oldest towns of Hungary, was the residence of the Hungarian prince. Gejza; and here his son, St Stephen, the first king of Hungary, was born in 979, and converted to Christianity in 1000. It was formerly fortified, and has undergone assaults and sieges almost without number.

GRAN SASSO D'ITALIA ("Great Rock of Italy"), also called MONTE CORNO, from the resemblance to a horn which it presents on the east, is the highest summit of the Apennines, having an elevation of 10,206 feet. It is situated on the borders of the Abruzzi, between Teramo and Aquila. It owes its name partly to its height, and partly to its being formed of a single mass of calcareous earth from its middle to its summit. It is seen to great advantage from the side of Teramo, where it is broken into tremendous precipices. The summit is covered with perpetual snow. Wolves, bears, and chamois abound on the mountain—the last of these animals being found in no other part of the Apennines. The general character of the scenery is more Alpine than Apennine, and in wild grandeur and variety, it is not surpassed by any landscape in Italy. To the painter, geologist, and botanist it affords a rich field for their respective pursuits. See "Itinerary" of F. Caldane.

GRANA'DA, an ancient kingdom, and one of the old provinces in the south of Spain, was bounded on the w. by Andalusia, on the e. by Murcia, and on the s. and

Digitized by Google

s.e. by the Mediterranean. Its greatest length from north-east to south-west was about 210 miles, and its greatest breadth about 80 miles. It is now divided into the three modern provinces of Granada, Almeria, and Malaga, the united areas of which amount to 11,063 square miles, and the united population, in 1870, to 1,351,909. The surface of this ancient province is mountainous and picturesque in a high degree. The mountain-ranges—the chief of which are the Sierra Nevada, the Sierra de Ronda, and the Alpujarras—as a general rule, run parallel with the coast. The principal rivers are the Almanzora, Almeria, Jenil, Guadalhorce, and Guadiaro, all of which, save the Jenil, an affluent of the Guadalquiver, flow into the Mediterranean. The province of G. is, on the whole, fruitful and highly cultivated. The mountains are rich in silver, copper, lead, and iron; and many of the inhabitants are engaged in mining and smelting. Saline and mineral springs abound. In the time of the Romans, G. was a portion of the province of Bætica; but after the Arab invasion it formed an independent Moorish kingdom. For a time it was exceedingly wealthy. From the year 1248 the Moorish kings of G. were obliged to recognise the supremacy of the kings of Castile. A quarrel, however, which arose between the vassal king of G. and Ferdinand and Isabella in the 15th c., resulted in a war of eleven years' duration, the consequence of which was the complete conquest of G. by the Spaniards in 1492, and the total destruction of Moorish authority in Spain. The modern province of G. has an area of 5080 sq. m.; pop. (1870) 485,346.

GRANA'DA (Spanish, *Granata*, Arab. *Garnathah*, said to be a corruption of *Karnáttah*, the ancient fortress of Phœnician origin), a famous city of Spain, formerly capital of the kingdom of Granada, and now chief town of the modern province of the same name, is built on a northern branch of the Sierra Nevada, at an elevation of 2445 feet above sea-level, in lat. 37° 15′ n., long. 3° 45′ w., and is about 140 miles east-south-east of Seville. It stands on the right bank of the Jenil, overlooking the fertile and extensive *Vega* or plain of G., and is watered also by the Darro, a rapid mountain-stream, which joins the Jenil about a mile below the town. Though now sadly decayed, it is still one of the greatest towns of Spain, is the seat of an archbishop, and has a university, attended, it is said, by about 800 students. One of the two hills on which the town is mainly built is surmounted by the Alhambra (q. v.); the other hill is occupied by the suburb called the Albayzin, the oldest part of the town, and now inhabited almost entirely by gipsies. The city of G. proper, namely, that portion of it that contains the Alhambra, is surrounded by high but ruinous walls, and by strong towers. The streets are narrow, crooked, and uneven; the houses, which for the most part are well built, are heavy and gloomy in outward appearance, having the flat roofs and projecting balconies of the Moorish style of architecture; the interiors, however, are convenient and suitable to the climate. G. has several charming public squares. The cathedral, a splendid structure, profusely decorated with jaspers and colored marbles, and having a high-altar placed under a dome, supported by 22 pillars, contains the monuments of Ferdinand and Isabella, and of Philip I. and his consort Juana. The industry and trade of the town are quite inconsiderable. Pop. 62,000.

The modern city of G. was founded by the Moors in the 8th c., and for some time remained subject to the califs of Cordova; but in 1235 it became capital of the kingdom of Granada, and rapidly rose to distinction as a wealthy trading city and as the seat of arts and architecture. Under the Moors, it attained the highest pitch of its prosperity. Toward the close of the 15th c., it is said to have had 400,000 inhabitants, and to have been surrounded by a wall fortified with 1030 towers. The *Vega* of G., in front of the city, was celebrated for two hundred years as the scene of contest between the Moors and the chivalry of Christendom—a contest which was brought to a termination only by the capture and complete subjection of G. by Ferdinand and Isabella in 1492, after a siege of twelve months.

GRANADA, a city of Nicaragua in a department of its own name, stands on the northwest side of Lake Nicaragua. It was founded by Hernandez de Cordova in 1522. The number of its inhabitants, including the suburbs and municipality of Jalatava, is about 15,000. Prior to 1854, it was the thriving seat of many commercial establishments. It suffered greatly, however, from the civil war that broke out in the republic during that year, and was under siege from May 1854 to February 1855; but was bravely and successfully defended by Don Fruto Chamorro, the

Digitized by Google

leader of the conservative party. In 1856, Chamorro having in the meantime died, G. was surprised and taken by the democrats, but was retaken and almost wholly destroyed in the following year. After the conclusion of peace, efforts were made toward the restoration of the city. It has not yet, however, regained its former prosperity and importance.

GRANDI'LLA, the edible fruit of certain species of Passion-flower (q. v.) The name, originally bestowed by Spanish settlers in the West Indies and warm parts of America, is a diminutive of *granada*, a pomegranate. The Common G. (*Passiflora quadrangularis*) is extensively diffused over these regions, and much cultivated. The plant is a luxuriant and very ornamental climber, often employed to form arbors and covered walks; it has large, beautiful, and fragrant flowers; oblong fruit, often six inches in diameter, of an agreeable fragrance, and a sweet and slightly acid pulp, very gratefully cooling. It is often eaten with wine and sugar.—The Apple-fruited G., or Sweet Calabash (*P. maliformis*), is plentiful in the woods of Jamaica, where it forms a principal part of the food of wild swine. It is, however, a very agreeable fruit, about two inches in diameter, its pulp gelatinous, the rind so hard as to be sometimes made into snuff-boxes and toys. The Laurel-leaved G. (*P. laurifolia*), sometimes called water-lemon in the West Indies, is a fruit about the size of a hen's egg; the plant has red and violet fragrant flowers, and very long tendrils. The fruit has a whitish pulp, so watery, that it is usually sucked through a hole in the rind; it has a delicious flavor, and a slight acidity. It is much cultivated.—Several kinds of G. are occasionally cultivated in hothouses in Britain. In the south of Europe, they grow in the open air.

GRANARY WEEVIL, another name of the CORN WEEVIL (q. v.).

GRANBY, John Manners, Marquis of, an English general, the eldest son of the third Duke of Rutland, was born January 2, 1721. Educated at Eton and Cambridge, he was at an early age elected M.P. for Grantham. In the rebellion of 1745, he raised a regiment of infantry, and accompanied the Duke of Cumberland into Scotland. Appointed colonel of the Horse Guards in 1755, in February 1759, he received the rank of lieutenant-general, and soon after was sent to Germany, as second in command, under Lord George Sackville, of the British troops, co-operating with the king of Prussia. After the battle of Minden, for his conduct in which he received the thanks of Prince Ferdinand of Brunswick, to the disparagement of his superior officer, who resigned, and was afterwards cashiered, he was appointed commander-in-chief of the British troops, and held that post during the remainder of the Seven Years' War. He particularly distinguished himself at the battles of Warburg in 1760, of Kirchdenkern in 1761, and of Græbenstein and Homburg in 1762. In 1760, during his absence with the army, he was appointed a member of the privy council. After the peace of 1763, he was constituted master-general of the ordnance, and in 1766 commander-in-chief of the army. He died October 20, 1770, in his 50th year. Though very popular in his time, as evidenced by the frequency with which his portrait was used as a sign to public-houses, he was the subject of some of the most terrible invectives of Junius; and his military qualities appear to have been much overrated by his contemporaries.

GRAND, in Music, is a word synonymous with great—such as grand sonata, grand symphony, overture, or chorus, signifying that the composition is full, and not simple or easy.

GRAND CAPE, in English Law, the name of the writ whereby in an action of dower, on the failure of the defendant to appear to answer to the summons, a third part of his lands are attached to await the decision of the court. The writ contains an order for the defendant to appear on a day specified. If the defendant do not appear on the return of the writ of grand cape, judgment is given in favor of the widow, who is thereupon entitled to take possession of the lands in satisfaction of her dower.

GRAND-COMBE, La, a town of France, in the Dep. of Gard, 35 miles northwest of Nimes, with which it is connected by railway. Near it are some very important collieries, which supply the French steam-navy at Toulon. In the town are oil-mills and glass-works. Pop. (1872) 4790.

GRAND COUTUMIER OF NORMANDY is a collection of the ancient laws

Digitized by Google

of Normandy, and is said to have been compiled in the third year of Henry III. It contains the laws and customs which were in use in England during the reigns of Henry II., Richard I., and John, and such also as were in force in Normandy after the separation of that duchy from England. It is therefore a collection of the laws of Normandy as they stood subsequent to the union with England. The customs of Normandy were to a great extent adopted in England after the Conquest; and the laws of this country, particularly during the reigns of the Norman sovereigns, present a great similarity to those of Normandy. Sir M. Hale, jealous for the honor of England, contends that this similarity arose from the introduction of English customs into Normandy. In the rules of descent, of writs, of process, and of trial, the laws of England and Normandy were at first almost identical. It appears from the Grand Coutumier, that though the verdict of twelve men was always required on a trial by jury, yet in case of a difference of opinion among the original jurors, the minority were set aside and fresh jurors chosen, until twelve men could be found to agree in a verdict. By the custom of Normandy, where a married woman died possessed of land, her husband was entitled to hold the lands, but only while he remained a widower. By the courtesy of England, on the other hand, the widower held the lands for his life. Lands held by Knights' Service (q. v.) and Grand Serjeanty (q. v.) descended, according to Norman custom, to the eldest son; but lands held on an inferior tenure were divided among the sons. And where a man had cohabited before marriage with the woman who afterwards became his wife, a son born before marriage inherited the land to the exclusion of children born in wedlock. See Hale's "History of the Common Law." The islands of Guernsey, Jersey, Alderney, and Sark were originally part of the duchy of Normandy, and were united to the crown of England by the first princes of the Norman line. Though still attached to England they are governed by the old feudal laws, or coutumier of Normandy. They have their own independent courts; and a writ from the courts at Westminster does not run in these islands. A royal commission under the great seal of course has force, but the commissioners must judge according to the law of the islands. All causes are originally determined by their own officers, the bailiffs and jurats of the island, who administer a code of laws based upon the Grand Coutumier. From their decision, an appeal lies to the privy council. Acts of the British parliament are not in force in these islands unless they are specially named.

GRAND DAYS were those days in every term solemnly kept in the Inns of Court and Chancery—viz. in Easter term, Ascension-day; in Trinity term, St John the Baptist's Day; in Michaelmas term, All Saints' Day (and of late, All Souls' Day); and in Hilary term, the festival of the Purification of our Lady, commonly called Candlemas Day; and these are *dies non juridici*, no days in court.—*Cowel*. On these days were formerly held the Revels for which the Inns of Court were famous. The last revel held in the Inner Temple was on Candlemas Day, 1733, on the occasion of Mr Talbot's elevation to the woolsack. At this feast fourteen students of the Inn waited at the bencher's table. After dinner a play was performed by actors who came full dressed from the Haymarket in chairs, and it is said, refused to receive payment for the honor of the occasion. After dinner judges, serjeants and benchers formed a ring round the stove in the centre of the hall, and *danced or rather walked about the coal fire, according to the old ceremony, three times*, and all the time the *ancient song* was sung by one Toby Aston, dressed in a bar-gown. The Prince of Wales, Frederick, father of George III., witnessed this part of the ceremony *incog*. The room was then prepared for dancing, which was kept up with the pleasing interlude of a splendid supper, until morning. See Pearce's "Inns of Court and Chancery." Grand days continue to be observed, but they have no longer the solemn character formerly attached to them. Nor are they held on the same days as formerly, for by the alteration in the law terms made by 11 Geo. IV. and 1 Will. IV. c. 70, those days no longer fall within the term. Grand days are now fixed at the pleasure of the benchers. On these days an entertainment is given in hall to the judges who had formerly been members of the Inn, and on this occasion an additional bottle of wine is supplied to every mess of four men among the barristers and students. On circuits also the circuit bar appoints a special day for the grand day, on which after dinner the various matters of social interest affecting the circuit are discussed and settled.

GRAND HAVEN, a small but rapidly increasing town in the state of Michigan, U.S., is situated on the eastern shore of Lake Michigan, at the mouth of Grand River, and forms the western terminus of the Detroit and Milwaukee railroad, which has here a most extensive depôt and a pier 3000 feet long extending into the lake. It has a spacious and excellent harbor, with a depth of from 30 to 50 feet. It exports timber, fish, leather, gypsum, stucco lime, and flour. The exports have already, in some years, exceeded one million dollars in value. Pop. (1870) 3700.

GRAND JURY is the assembly of good and sufficient men, summoned by order of the sheriff to attend every sessions of the peace and every commission of oyer and terminer and general jail delivery in England, for the purpose of inquiring into the charges for offences, and of returning to the court their delivery thereon. The institution of the grand jury dates back to the earliest period of English history, having been in use among the Saxons. By a law of Ethelred it is enacted, "Exeant seniores duodecim thani, et præfectus cum eis, et jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocentem accusare, nec aliquem noxium celare."—Wilkins, "Leges Aug. Sax." 117. From this enactment, it appears that the number of the grand jury was originally twelve; but we learn from Bracton that, in the time of Henry III., it was the practice to return four knights for every hundred, who elected twelve other knights, or else twelve *liberos et legales homines*, to take part with them in the inquest. Towards the latter part of the reign of Edward III., in addition to the inquest for the hundred, the sheriff was required to return a panel of knights for the whole county. This jury was called *le graunde inquest*, and made inquiry for the county, while the jury for the hundred inquired for its own district only. After the establishment of the *graunde inquest*, the practice of summoning a jury of the hundred gradually went out of use; but until 6 Geo. IV. c. 50, it was deemed necessary that some of the grand jury should be summoned for every hundred. In the present day, the grand jury must consist of not less than twelve, or more than twenty-three members. A grand jury is summoned for every assize, and for the quarter-sessions in counties and burghs. It is not necessary that grand jurors should be freeholders; they may be leaseholders or ratepayers, but often are gentlemen of wealth. The qualification of grand jurors is fixed by 6 Geo. IV. c. 50, and is the same as that of the petit jury. See JURY TRIAL. Town-councillors of a burgh are exempt from serving on juries within the burgh. An Irish peer, who is a member of parliament, is liable to serve on the grand jury at assizes. An alien cannot serve on the grand jury unless he has been naturalised. In Middlesex, two grand juries were summoned every term, and sworn before the senior judge of the Queen's Bench, but this is discontinued unless on special occasions. After having the oath administered, and receiving a charge from the judge, they retire to their room, and the various indictments, which are called bills, are laid before them. The duty of the grand jury is simply to inquire whether there is sufficient *prima facie* evidence to require a trial. For this purpose, they may require the same evidence, written and parol, as may be necessary to support the indictment at the trial. But in the practice, having ascertained that the crown has a sufficient *prima facie* case, they return a true bill, the prisoner's evidence being reserved for the trial. Witnesses are sworn on their examination before the grand jury by an officer appointed by the court. When the jury have come to a conclusion, the clerk indorses on the indictment *a true bill* in case the jury, or a majority of twelve, are satisfied that the case is sufficiently strong. In case they are not satisfied, the indictment is indorsed *not a true bill*. The foreman, accompanied by one or more of the jurors, then carries the indictments into court, and presents them to the clerk, who states to the court the nature of the charge and the indorsement of the jury. A bill having been thrown out by the grand jury, it cannot be preferred to the same grand jury during the same assizes or sessions. The grand jury usually serve for the whole session to which they are summoned; but in an emergency, as where a serious crime has been committed, and the prisoner brought in after the jury has been discharged, it is competent to swear a new jury. It frequently happens at assizes that, an offence having been committed before the grand jury have been discharged, a bill is immediately sent before them, on which they make their return; so that the case is disposed of in a few days, or even a few hours, after commission of the offence.

Although the grand jury has been often complained of as a somewhat superfluous

Digitized by Google

step in the prosecution of offences, and as no longer required, yet it provides an additional safeguard to the liberty of the subject in all cases. It has, however, been proposed to abolish it when the case has been already before a magistrate, who has like duties to perform.

In Scotland there is no grand jury; the duty of investigating and bringing to trial in that country being assigned to a public prosecutor. See ADVOCATE, LORD.

GRAND MASTER (Lat. *magnus magister*; Ger. *Hochmeister*), the title of the head of the military orders, the Hospitallers, the Templars, and the Teutonic knights; see these articles. The title originally borne by the superior of the Hospitallers was simply "master" (*magister*); but in 1268 Hugh de Rival took that by which they are since known—grand master, *magnus magister*. In the Teutonic order, the title "master," with different modifications, was applied to the several superiors of the order in the various countries. Thus, the superior of Germany was styled *Teutsch-meister*, "German master." The superior of Livonia was called *Heer-meister*, "military master." In all these orders the office of grand master was held for life. The name was also used in the Dominican order.

GRAND PE'NSIONARY. Formerly the syndic of each of the important towns of Holland was termed a Pensionary, and the state-secretary for the province of Holland, a grand Pensionary. Until the time of Olden Barneveldt (q. v.), the Grand Pensioner was also advocate-general for the same province. He had no vote in the assembly of the states, and could only bring forward the subjects of discussion. He, however, collected the votes, wrote the decrees, read the letters addressed to the states, conducted negotiations with foreign ambassadors and ministers, and took charge of the revenues of the province, of its rights and privileges, and whatever else pertained to its welfare. He was a perpetual member of the states-general of the United Netherlands, and thus, as first magistrate of the first of the United Provinces, he acquired immense influence over all Holland, and may be considered premier of the Dutch parliament. The Grand Pensionary held his office for five years, but was in most cases re-elected. The office was abolished in 1795, after the conquest of Holland by the French revolutionists.

GRAND RAPIDS, a prosperous manufacturing city, in the state of Michigan, United States, is situated in a pleasant and healthy district on both banks of the Grand River, about 33 miles from Lake Michigan, and 60 miles north-west of Lansing. The river is here about 900 feet wide, and descends 18 feet in the course of one mile, producing abundant water-power. The town is handsomely built, commands a fine view, and is one of the most important trading and manufacturing cities in the state. The vicinity is rich in salt and gypsum, and in limestone, pine-lumber, and other building materials. Pop. (1880) 32,016. The city was first settled in 1833, and incorporated in 1850.

GRAND RIVER, a river of North America, rises and flows throughout its entire course, within the state of Michigan, and falls into the lake of that name at the town of Grand Haven (q. v.). Its source is in the south-east of the state, in two branches which unite near the town of Jackson. G. R. is navigable for large steamers to the rapids, which are 40 miles from the mouth of the river, and for smaller boats for 50 miles further; its whole course is 270 miles.

GRAND SE'RJEANTY (*magna serjeantia*, or *magnum servitium*, great service) was the most honorable of the ancient feudal tenures. According to Lyttleton, tenure by grand serjeanty is where a man holds his lands or tenements of our sovereign lord the king by such services as he ought to do in his proper person to the king, as to carry the banner of the king, or his lance, or to lead his army, or to be his marshal, or to carry his sword before him at his coronation, or his carver, or his butler, or to be one of his chamberlains of the receipt of his exchequer, or to do other like services. This tenure must have been held of the king. Where lands were held of a subject, on condition of performance of services identical with those which were rendered to the king, the tenure was not grand serjeanty, but knight's service. Thus, lands on the Scottish border held of the king by cornage—i. e., on condition of winding a horn to give notice when the Scots had crossed the border—were held in grand serjeanty; but lands held of a subject for the same service were

Digitized by Google

held in knight's service. Tenants holding by grand serjeanty were free from escuage, which usually appertained to knight's service, and in general could only be called upon to perform their services *infra quatuor maria*, within the kingdom. The services in grand serjeanty were to be performed by the tenant in person, where he was to do so. The office of attendance on the sovereign's person was esteemed so honorable, that no one below the dignity of a knight could perform it. Hence, where lands held by grand serjeanty were in the possession of a citizen, he was permitted to perform his service by deputy. This tenure by grand serjeanty was by 12 Charles II. c. 24, in common with other military tenures, reduced to common Socage (q. v.), except so far as regards the honorary services, which continue to be observed to this day. Thus, the Duke of Wellington holds of the crown his estate of Strathfieldsaye on condition of presenting to the sovereign a flag bearing the national colors on each succeeding anniversary of the battle of Waterloo. The manor of Woodstock, with the demesne, in which is situated Blenheim Park, is held by the Duke of Marlborough by grand serjeanty, on condition of presenting to the Queen and her heirs, at the castle of Windsor, a standard of France, on the 13th August yearly, being the anniversary of the day on which the battle of Hochstädt was fought, near the village of Blenheim, on the banks of the Danube. The tenure of grand serjeantry was observed throughout the continent of Europe. "The free-born Franks," says Mr Hallam, "Middle ages," "saw nothing menial in the titles of cupbearer, steward, marshal, or master of the horse, which are still borne by the noblest families in every country in Europe, and by sovereign princes in the empire. The Count of Anjou, under Louis VI., claimed the office of great seneschal of France—i. e., to carry dishes to the king's table on state-days. Thus, the feudal notions of grand serjeanty prepared the way for the restoration of royal supremacy, as the military tenures had impaired it."

In Scotland, grand serjeanty was not known as a separate tenure—that is to say, lands held on condition of honorary services rendered to the sovereign were not attended with any privileges other than those attaching to lands held in a similar manner of a subject superior. In that country, a tenure by honorary service was known as a BLANCH HOLDING.

GRANDEE'S (Span. *grandes*), the name by which the most highly privileged class of the nobility of the kingdom of Castile has been known since the 13th century. To this class belonged the whole of that very powerful portion of the nobility who, from their wealth, were called the *Ricos Hombres* by pre-eminence; and to whom, moreover, the crown had granted the right of bearing a banner, and of gathering mercenaries around it on their own account. The members of the royal family were as such included amongst the grandees. The honors of the grandees were hereditary; they held lands from the crown on the tenure of military service, being bound to produce a certain number of lances, each lance being represented by a knight with four or five men-at-arms. The grandees were exempted from taxation, and could not be summoned before any civil or criminal judge without a special warrant from the king. They were entitled to leave the kingdom, and even to enter the service of a foreign prince at war with Castile without incurring the penalties of treason. Besides these privileges, which were common to them with the rest of the higher nobility, the grandees possessed several which were peculiar to themselves, or which they shared only with the so-called "Titulados"—the counts and dukes. Of these must especially be mentioned the right in all public transactions of being covered in the presence of the king. The king addressed a grandee as *mi primo*, "my cousin-german;" whereas any other member of the higher nobility he called only *mi pariente*, "my relative." In the national assemblies, the grandees sat immediately after the prelates and before the titled nobility (titulados). They had free entrance into the palace, and into the private chambers of the monarch; and on the occasion of religious solemnities, they had their place in the chapel royal next to the altar. Their wives shared their dignities, the queen rising from her seat to greet them. Under Ferdinand and Isabella, Cardinal Ximenes succeeded in breaking the power of the feudal nobility so completely, that by the end of the 15th c. the privileges both of the grandees and of the rest of the higher nobility were almost wholly abolished. Ferdinand's successor, Charles V., who considered it still necessary to bind to his party some of the nobles, and to reward others for the important services which they had rendered him, contrived out

Digitized by Google

of an independent feudal nobility to construct a dependent court nobility. Gradually three classes of grandees arose out of this merely nominal nobility. It was the privilege of the first class to be commanded by the monarch to be covered before they had begun to address him; the second class received this command as soon as they had finished their address, and heard the king's reply with covered head; but to the third class it was addressed only after they had already listened uncovered to the royal reply. All grandees had the title *excellency*, and sentries were bound to present arms to them. By the revolution and under the government of Joseph Bonaparte, the dignities and privileges of the grandees were entirely abolished; but they were partially restored at the subsequent restoration, though no very important privileges were bestowed on them. According to the constitution of 1875, grandees are members of the Senate or Upper House in their own right.

GRA'NDFATHER. A grandfather is not liable at common law in England to maintain grandchildren; but if they are destitute, and are relieved by the parish, the parish may, under the statute 43 Eliz. c. 2, call upon him, if able, to contribute to their support. In Scotland, the liability exists at common law, and is enforceable without the aid of a statute if the father, who is primarily liable, is unable to maintain the children.

GRANDVILLE, Jean Ignace Isidore Gérard, a French artist and caricaturist, was born at Nancy, 3d September 1803. In the year 1828, he published the first of a series of humorous sketches, entitled "Les Métamorphoses du Jour," which were highly thought of; and soon afterwards another series, entitled "Les Animaux Parlants." After the July revolution, G., with Decamps and Daumier, became the moving spirit of the "Caricatures," perfect collections of which are now in great request. His "Convoi de la Liberté," his "Basse Cour," "Mat de Cocagne," &c., as pictures of the politics and manners of the times, are of great and lasting value. When the law of September put an end to political caricature, G. used his pencil to satirise the less important follies and vices of mankind. He also contributed illustrations to new and splendid editions of the "Fables" of Lafontaine and Florian, the "Adventures of Robinson Crusoe," "Gulliver's Travels," Abel Hugo's "Vie de Napoleon," Raybaud's "Jérôme Paturot," &c. G. is remarkable for depth and delicacy of observation and criticism, for his ingenious turn of thought, and accuracy in portraiture. His drawing is correct, his anatomy accurate, his foreshortening carefully studied; the whole is occasionally hard and cold, the idea complicated, but always united with rare delicacy of allusion and affluence of symbolical details. G. died in 1847.

GRANE, Gran, or Quade, a town and seaport of Arabia, is situated on a bay of the same name at the north-western extremity of the Gulf of Persia, in lat. 29° 26' n., long. about 48° e. Its trade is of some importance. Pop. estimated at about 8000.

GRANI'CUS, the ancient name of a small river in the north-west of Asia Minor, flowing from the northern side of Mount Ida to the Propontis, and now known as the Kodsha-su. The G. is celebrated as the scene of the first victory gained by Alexander the Great over the Persians after he crossed the Hellespont, 334 B.C.

GRANIER DE CASSAGNAC, Bernard Adolphe, a name well known among Parisian journalists, and not unknown in the Palais de Justice, was born at Averon-Bergelle (dep. Gers), in 1808. He was educated at the college of Toulouse, and contributed for a short time to the southern press, but soon quitted the provinces for Paris, where Victor Hugo introduced him to the "Journal des Débats," and "Revue de Paris." Here his vehement style did not give satisfaction, and he was engaged by M. Girardin to write literary criticisms for "La Presse." In 1840, he sailed for the Antilles, in hopes of political advancement, ingratiated himself with the planters, although he narrowly escaped being murdered by the blacks, married a Creole lady, Mademoiselle Beauvallon, and returned to Paris as deputy for Guadelope. Not being able to arrange a satisfactory engagement with "La Presse," he founded the "Globe," ultra-Orleanist, and violent to such a degree that the opposition journals agreed to ignore it (*la conspiration du silence*, as it was called). The "Globe" failed; and in 1845 G. de C. started "L'Epoque," also violent, and also a failure. It was merged in the "Presse," not, however, before its editor had been

Digitized by Google

openly accused in the Chamber of Deputies of selling his influence with the government. Shortly before the Revolution, he was employed by M. Guizot to set up a ministerial paper at Rome. In 1848, he returned to France, and after a while reappeared in Paris, as an ardent supporter of the Prince President, and a bitter foe to his old patrons, the House of Orleans. He edited the "Pouvoir" (1850), and wrote for the "Constitutionnel" with an excess of zeal and a pretence of exclusive information which led to an *avertissement*. In 1852, he was elected as the government candidate for Mirande (Gers), for which he was re-elected in 1857 and 1863. In the Chamber, he spoke in favor of the Army Dotation Bill, advocated direct taxation on all descriptions of funded property, additional protection for the interests of literature, and the formation of a local railway in his department. On the 23d of May 1857, he was made Grand Officer of the Legion of Honor, and in the same year founded "Le Réveil," a weekly religious organ, which died the next year. He afterwards became principal editor of the semi-official "Pays," and in 1863 was manager of the "Nation." In 1870, on the fall of the empire, he retired to Brussels; in 1876 he was elected a member of the National Assembly. The appearances of G. de C. before the courts of justice have been numerous. In 1842, he was tried for a duel with M. Lacrosse, of whose father he had written disrespectfully, and whom he lamed for life. In 1845, he prosecuted M. Hilbey for libel in his pamphlet on the "Venality of the Press." In 1847, he was mixed up in the duel in which his brother-in-law, Beauvallon, killed Dujarrier of "La Presse," and about which strange things were said. He was also sued by Delasalle for a debt which he declared he had paid. M. Delasalle gained his cause. In 1855, his publisher proceeded against him for non-delivery of a MS. on the Eastern War. The duel between Paul de C. of the "Pays" and a writer in the "Soleil" (in which G. de C. seconded his son), and the unseemly quarrel between the Cassagnacs and M. Vermoul of the "Courrier Français," were matters of great notoriety. His most important works are: "A Voyage to the Antilles" (1844); "The Queen of the Prairies," a romance (1845); "The Causes of the French Revolution of 1789" (1850); "The History of the Directory," a reprint from the "Constitutionnel" (1851—1856); "The Fall of Louis Philippe" (1857); "The Girondins and the Massacres of September" (1860), &c. All his writings are remarkable for vigor of style, but the thorough-going partisanship of the author greatly impairs their historical value.

GRA'NITE, a well known igneous rock, composed of the three minerals, quartz, felspar, and mica, united in a confused crystallisation; that is, without a regular arrangement of the crystals. The felspar is the most abundant ingredient, and the proportion of quartz is greater than that of mica. The name has been given to it on account of its granular structure.

Granite differs from greenstone and the later igneous rocks, in the large quantity of quartz that enters into its composition. In the trappean and other igneous rocks, the silica or silicic acid is only sufficient for union with the bases to form felspar and hornblende, the constituents of these rocks, none remained free to crystallise as pure quartz; while in granite, so great is the excess of silex, that in its pure state, as quartz, it forms a considerable bulk of the rock. Granite is always a compact rock, it never passes into or alternates with tuffs or breccias. This peculiarity, associated with the crystalline structure of the rock, and the absence of cellular cavities, such as are produced in trappean and volcanic rocks by the expansion of the contained gases, have led to the belief that granite has been formed at considerable depths in the earth, and has crystallised slowly under great pressure either from superimposed strata or deep seas. On this account the granitic rocks have been called "Plutonic rocks;" and Lyell has applied to them the term "hypogene," from *upo*, under, and *ginomai*, to be born. It was formerly supposed that all granitic rocks were formed before the deposition of any of the sedimentary strata, and hence they were named "Primitive rocks." But it having been found that granite is associated with formations of various ages, and that even since the beginning of the Tertiary epoch its intrusion among the Eocene strata of Central Europe has raised the Alps more than 10,000 feet above the level of the sea, this name has been entirely dropped. Although granite is not absent from the Secondary and Tertiary strata, it is more frequently associated with the Palæozoic formations; indeed, it appears to be the fundamental rock of the earth's crust. Wherever we reach the base of the stratified rocks, we find them resting upon granite; and whatever the

Digitized by Google

age of the strata thus lying on this igneous rock, we have no reason to suppose that below the granite there occur beds of older date; for although granite penetrates the stratified rocks, it has not been noticed to spread over them like greenstone, so that wherever it presents itself in a large mass, it is believed that no other rock is beneath it. Some granites, however, occur interstratified with undoubted sedimentary rocks, and it is argued that as the transition from these sedimentary rocks to the crystalline granite can be traced by gradual stages through mica schist and gneiss, the granite is only the final stage of these metamorphic changes. Many of the granites of Scotland are accordingly believed to be older palæozoic sediments greatly altered. It is not maintained that all granites have such an origin, but no lithological character has yet been observed whereby the igneous granite can be distinguished from that produced by metamorphic action.

Large extents of the earth's surface are covered with granites; occasionally it is the superficial rock in flat undulating plains, but it most frequently makes its appearance in mountainous regions. It seems probable that sometimes igneous granite has been raised from below as a solid indurated rock; it has however generally been in a fluid condition, as is evidenced by the number of veins which are protruded from it into the adjacent rocks.

The varieties of granite depend upon the number and quantity of its mineral constituents, and upon the state of aggregation of these materials. Ordinary granite is composed of felspar, mica, and quartz. The felspar may be either the flesh-colored potash variety, orthoclase, or the pure white soda variety, albite, or both potash and soda may enter into its composition. The mica varies in color from a pure silvery white, through the more common brown, into black. The quartz is generally white, seldom dark-gray or brown. The predominance of one or other of the ingredients, or of a particular variety, gives the peculiar color to the mass, which is generally either red, gray, or white. The red is produced from the predominance of orthoclase; the white, of albite; and the intervening gray from the mica, or sometimes from the quartz. The felspar forms generally a half, and sometimes even more of the bulk of the rock; the mica in one variety, and the quartz in another, are so minute as to be scarcely visible. Sometimes the felspar separates into large and distinct crystals forming a porphyritic granite. The substitution of hornblende for mica produces that variety called Syenite (q. v.); and if talc takes the place of the mica, the rock is called Protogene (q. v.). When the ingredients exist in a compact and finely granular condition, the compound is known as Eurite. Sometimes, especially in veins, felspar and dark quarts are arranged so as to produce an imperfect laminar structure, which, when broken at right angles to the laminæ, presents numerous broken and angular lines that have a faint resemblance to Hebrew characters, whence it is called Graphic Granite.

Granite is largely used as a building material in bridges and engineering-works, and also in public buildings and dwellings. The difficulty of working it makes it expensive, but this is counterbalanced by its great durability. It cannot be cut, like the majority of building-stones, with saws, but is worked first with large hammers, and then with pointed chisels. The success with which the Egyptians operated upon this refractory stone is very extraordinary. They worked and polished it in a way which we cannot excel, if, indeed, we can come up to it, with all the appliances of modern science; and not content with polishing, they covered some of the blocks with the most delicate and sharply cut hieroglyphics!

The granites best known for ornamental purposes are the gray Aberdeen granite and the reddish colored Peterhead granite. Of this last-mentioned variety, handsome polished columns for public halls have been constructed.

The soil produced by the weathering of granitic rocks should be fertile, as their chemical composition contains the necessary elements. The great hardness of the rock, and its resistance to atmospheric influences, prevent a soil of any thickness being formed; and even where it exists, at least in our temperate regions, it is generally so high and exposed, that it is unfavorable to vegetation; in warmer climates, such soils are frequently very fertile.

GRANMICHE'LÉ, a town of Sicily, in the province of Catania, and 30 miles south-west from Catania, on a mountain ridge, at an elevation of 1768 feet above the sea. Beautiful marbles are produced in the neighborhood. The town was founded in the end of the 17th c. by the Branciforte family, and peopled with the inhabitants

Digitized by Google

of the neighboring town of Occhialà, which was destroyed by the earthquake of 1693. Pop. 10,058.

GRANT, in English law, the conveyance of real property by deed. Originally, the term grant was confined to the conveyance of incorporeal hereditaments and estates in reversion; according to the maxim that incorporeal property lay in grant, and corporeal property in livery, it being impossible to give actual sasine of that which had no tangible existence, or was not in the possession of the granter. In order to complete the conveyance of a reversion or remainder by grant, it was necessary that the tenant of the particular estate should acknowledge the grantee by attornment. The necessity for attornment was abolished 4 and 5 Anne, c. 16, s. 9. By 8 and 9 Vict. c. 106, it is enacted that estates, corporeal as well as incorporeal, may be conveyed by grant.

GRANT, Francis, Lord Cullen, a Scottish judge and political writer, was the son of Archibald Grant of Bellinton, a cadet of the family of Grant of Grant, chief of the clan of that name. He was born about the year 1660, was educated first at Aberdeen, and afterwards at Leyden, adopted the profession of the law, and distinguished himself by his loyal zeal for the successive governments of William III., Queen Anne, and George I. He wrote in favor of the Union, on the Observance of the Sabbath, on the law of Patronage in the Church, essays on Law, Religion, and Education, and Reflections on the Rebellion of 1715. For seventeen years, he filled the position of a judge with great ability and integrity. He died at Edinburgh in 1726.

GRANT, Patrick Lord Elchies, a Scottish judge, was born in 1690. He collected the Decisions of the Court of Session from 1733 to 1757, and wrote annotations on Lord Stair's Institutes. He was celebrated as an acute and learned lawyer. He died in 1763—His Son John Grant, became one of the Barons of Exchequer in Scotland.

GRANT, James, of Corrimony, in Inverness-shire, born in 1743, died in 1835, was author of "Essays on the Origin of Society," 1785, and "Thoughts on the Origin and Descent of the Gael," 1814. The latter is a learned and ingenious work, imbued with Celtic feeling and enthusiasm.

GRANT, Mrs, of Carron, author of the popular song of "Roy's Wife of Aldivalloch," was born near Aberlour, in Banffshire, about the year 1745. She was twice married—first to her cousin, Mr Grant of Carron, near Elchies, on the river Spey; and secondly, to Dr Murray, a physician in Bath. She died at Bath about 1814.

GRANT, Sir William, an eminent lawyer, was descended from the Grants of Baldornie, and was born at Elchies, in Strathspey, in 1754. He was some time Attorney-General in Canada, then M.P. for Shaftesbury, and subsequently for Banffshire; was sixteen years Master of the Rolls, from which he retired in 1817, and died in 1832. Lord Brougham describes him as the greatest magistrate that ever adorned the English bench; and Charles James Fox declared that he was the only man in the House of Commons whom he had any diffidence in replying to. This arose from the fact, that Grant was a most logical debater and close reasoner.

GRANT, Mrs Anne, a miscellaneous writer, whose works were among the first to draw public attention to the romantic scenery and peculiar manners of the Scottish Highlands, was born in Glasgow, in 1755. She was the daughter of a British officer named M'Vicar, who became barrack-master of Fort Augustus. She married the Rev James Grant, chaplain of the fort, and subsequently of Laggan. Left a widow in destitute circumstances, Mrs. G. published by subscription, a volume of "Poems" (1803), which were well received; in 1806, "Letters from the Mountains"—a highly popular work; in 1808, "Memoirs of an American Lady;" in 1811, "Essays on the Superstitions of the Highlanders of Scotland;" In 1825, Mrs G. received from government a pension of £100 a year. She died in 1838.

GRANT Charles, Lord Glenelg, was born in India, at Kidderpore, presidency of Bengal, 1779. He was of a Highland family, the Grants of Shewglie. His grandfather (who was slain at the battle of Culloden) married one of the Macbeans of Kinchyle; and his father was born in Aldourie House, on the banks of Loch Ness, also the birthplace of Sir James Mackintosh. The father of Lord Glenelg (also Charles

Digitized by Google

Grant) went early to India, became one of the most distinguished directors of the East India Company, represented for many years the county of Inverness in parliament, and was, along with Wilberforce, Thornton, Zachary Macaulay, and others, a leading member of the Clapham sect, described by Sir James Stephen in his "Ecclesiastical Essays." He died in 1823, aged 77. Charles, his eldest son, was carefully educated, and distinguished himself at Magdalene College, Cambridge, where he took his degree of M.A. in 1804. In 1805, he published a poem on the "Restoration of Learning in the East," which had carried the university prize awarded by Dr Claudius Buchanan. He was called to the bar in 1807, but never practised. In 1811, he was elected M.P. for the Inverness district of burghs; and afterwards succeeding his father in the county representation, he continued in the House of Commons for a period of 25 years, at the expiry of which he was raised to the peerage by letters-patent bearing date May 8, 1835. G. held for five years the office of a Lord of the Treasury; and in 1819, succeeded to the important appointment of Secretary for Ireland, which he continued to fill for about two years. He was the first Secretary for Ireland that sought to carry out conciliatory measures. He endeavored to suppress the Orange demonstrations, to secure the impartial administration of justice, and to devise a system of national education adapted for Catholics as well as Protestants. Nearly all that has since been done was proposed by this enlightened statesman, and the future historians of Ireland will point to him as one of the genuine though ill-requited benefactors of that country. From 1823 to 1827, G. was Vice-president of the Board of Trade; from 1830 to 1834, President of the Board of Control; and from November 1834 to February 1839, Secretary of State for the Colonies. After this period, G. withdrew in a great measure from public affairs, but supported the Liberal party by his vote. He died at Cannes, in France, in 1866. Lord Brougham pronounced G. to be "the purest statesman he had ever known." He was an eloquent speaker, though partly from diffidence, and partly from indolence, he spoke but seldom. Some of his dispatches as Colonial Secretary, on the rights of the natives in the colonies, on repressing idolatry, and abolishing slavery throughout the British possessions in South Africa, are models of elevated and just thought, and of fine impressive English.

GRANT, Sir Robert, governor of Bombay, brother of Lord Glenelg, was born in 1785. In 1801, the brothers took their degree of B.A. together in Cambridge, Charles being third, and Robert fourth wrangler, with the additional distinction of Charles being first, and Robert second medalist. The latter was called to the bar at Lincoln's Inn in 1807, sat for some time in the House of Commons as member for Inverness, and afterwards for Norwich and for Finsbury. In 1834, he was knighted, and appointed governor of Bombay. He died at Dapoorie in 1838. He was author of two treatises on Indian Affairs, and of several hymns and short poetical pieces, greatly admired, which were collected and published by Lord Glenelg in 1839.

GRANT, Sir Francis, fourth son of Francis Grant of Kilgraston in Perthsire, was born in Edinburgh, 1803. He received his education at Harrow and at the university of Edinburgh, and was, it is said, originally intended for the Scottish bar, but soon abandoned all thoughts of legal honors, to follow his natural genius for painting. He studied drawing under Somerville, a local artist of some repute, and was enabled, by the kindness of Lord Elgin, to form his taste in that nobleman's gallery. A noble portrait by Velasquez is said to have exercised an especial influence over the young painter's future art-career. His first picture was exhibited in 1834, when he at once took rank among the best portrait-painters of the day, and was regarded as a worthy successor of the Courtly Lawrence. His most famous works are those in which he has combined the likenesses of distinguished characters with scenes of English sport. The "Meet of H.M. Stag-hounds," painted in 1837 for Lord Chesterfield, and containing no less than 46 portraits, the "Melton Hunt," executed for the Duke of Wellington; and the "Cottesmore," for Sir R. Sutton, are the best known in this class. Among his other paintings, may be mentioned the equestrian portraits of the Queen and Prince Consort for Christ's Hospital; the picture of the beautiful Marchioness of Waterford; and those of Lords Palmerston, Russell, Gough, Macaulay, Hardinge, &c. In 1842, Mr. G. was elected Associate, and in 1851, Academician. In 1855, he received one of the three gold metals awarded to British artists at the Paris Exhibition (for his "Meet of H.M. Stag-hounds"),

Digitized by Google

and was also elected Member of the Belgian Academy. In 1866, the President's chair in the Royal Academy having become vacant, through the death of Sir C. Eastlake, and neither Sir E. Landseer nor Maclise being desirous of the post, Mr G. was elected in February by 23 votes out of 29, and soon after received, according to ancient precedent, the honor of knighthood. In 1870, he received the degree of D.C.L. from Oxford. Sir Francis has been twice married. His first wife was a Miss Farquharson of Invercauld; his second, Isabella, daughter of Mr and Lady Elizabeth Norman, by whom he has a numerous family.

GRANT, Ulysses Simpson, eighteenth president of the United States, was born at Point Pleasant, Clermont County, Ohio, April 27, 1822; graduated at the military academy of West Point in 1843, and served under General Taylor in the war with Mexico, 1846, up to the capture of Monterey. His regiment was then transferred to the expedition under General Scott, and he took part in every action from Vera Cruz to Mexico, and was brevetted first-lieutenant and captain for meritorious conduct at Molino del Rey and Chapultapec. In 1852, he served in Oregon; but, in 1854, resigned his commission, and settled at St Louis, Missouri, whence, in 1859, he moved to Galena, Illinois, and engaged in the leather trade. At the beginning of the War of Secession in 1861, he volunteered his services, and was appointed colonel of an Illinois regiment. In August he was appointed brigadier-general, commanding the important post of Cairo, occupied Paducah, and led an expedition on the Mississippi. In February 1862, he distinguished himself in the capture of Fort Donelson, on the Tennessee River, and was made major-general. On the 6th of April following, after a preliminary defeat, he won a great battle over the Confederates at Pittsburg Landing, or Shiloh. Succeeding General Halleck in the west, he commanded the land-forces which, in conjunction with the navy, reduced Vicksburg, July 4, 1863, soon followed by the fall of Fort Hudson, and the opening of the Mississippi. He then took command of the army of Tennessee, and defeated General Bragg at Chickamanga, in September of the same year; and was, in 1864, appointed lieutenant-general and commander-in-chief, and personally directed the operations of the great final struggle in Virginia, in which the northern forces, though often repulsed with heavy losses, finally compelled the evacuation of Richmond, April 2, 1865, followed on the 9th by the surrender of the Confederate army under General Lee, and soon after of the entire Confederate forces. Congress, in recognition of his eminent services, passed an act reviving the grade of "General of the Army of the United States," to which G. was immediately appointed. In 1868, he was elected, on the "republican" platform, president of the United States; and having, in 1872, been re-elected over a notable opponent, the late Horace Greeley of the "New York Tribune," he retired in 1877 after his second term of office. In the latter year G. visited Europe, and in England and France received an enthusiastic welcome. Simple, reticent, earnest, and preserving in his character, he owed his military success not so much to strategy as to superior numbers and resources, and hard fighting, in which even a series of victories left his enemy less able to resist. During G.'s presidency a great reduction was made upon the national debt incurred during the civil war. The military government of the southern states in those years cannot be regarded as successful. The most important event connected with relations to foreign states was the settlement of the Alabama question by the "joint high commission" in 1871.

GRA'NTHAM, a municipal and parliamentary borough and market-town of England, in the county of Lincoln, is situated on the left bank of the Witham, 23 miles south-south-west of the city of Lincoln, and about 110 miles north-north-west of London. G. has a free grammar-school, with an income from endowment of £800 a year. The parish church, a beautiful structure of the 13th c., has a fine spire 273 feet high. Here Newton was instructed in classics before entering Cambridge. A canal 30 miles long connects this town with the river Trent. The trade is chiefly in malt, corn, and coal. G. returns two members to the imperial parliament. Pop. of parl. bor. (1871) 13,250.

GRANULA'TIONS, the materials of new texture as first formed in a wound or on an ulcerated surface. See INFLAMMATION, CICATRISATION, WOUNDS, ULCER.

GRANVILLE, a fortified town and seaport of France, in the department of La

Digitized by Google

Manche, is situated on a promontory surrounded by a fort, 23 miles north-east of St Malo. It is a badly built, dirty, and uninteresting town; the extensive new pier, built in a sufficiently strong manner to admit of its being mounted with cannon, and the old parish church of gray granite, built in the flamboyant style, being almost the only noteworthy features. Its harbor, though well-sheltered and capable of accommodating 90 ships, is always dry at low water. The principal trade of G. is in the whale, cod, and oyster fisheries. Pop. (1872) 11,571.

GRAPE-SHOT, called also *tier-shot*, consist of bullets or small iron balls piled round an iron pin, holding together a series of parallel iron plates (each the diameter of the cannon used), between which are the shot, kept in their places by holes in the plates. Small 3¼-inch or 4-inch shells are also quilted together like grape for firing from mortars at short range, as, for example, in clearing the covert-way of a fortress from the third parallel. In either case, the explosion of the charge bursts asunder the binding, and the shot (or shells) begin to scatter directly on leaving the muzzle of the piece. Grape are very formidable against dense masses of troops; but, of course, only at comparatively short ranges. The shot employed differ in weight from 6 oz. to 4 lbs., according to the calibre of the gun from which they are fired.

GRAPE-SUGAR. See SUGAR; and GLUCOSE.

GRA'PHITE. See BLACK LEAD.

GRAPE-HYACINTH (*Muscâri*), a genus of bulbous-rooted plants, of the natural order *Liliaceæ*, nearly allied to the hyacinths, but differing in the globose or subcylindrical perianth, contracted at the mouth and 6-toothed. The species are natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them are frequent in our flower borders. *M. moschatum* has a smell of musk. *M. racemosum* is a somewhat doubtful native of the south of England. The flowers of the grape hyacinths are mostly blue.

GRA'PHIS (Gr. *grapho*, to write), a genus of lichens which gives its name to a tribe, *Graphideæ*, remarkable for the resemblance which the fructification (*apothecia*, or *shields*) assumes to the forms of the letters of oriental alphabets. Hence some of these little plants have received such names as *Scripture-wort*. A peculiar importance has recently been acquired by some of the *Graphidæ*, from their being found only on the bark of particular species of *Cinchona*, so that they guide to the ready identification of some of the most valuable commercial barks.

GRA'PHOTYPE is one among numerous modes invented within the last few years of producing an engraved surface from which printing can be effected by the ordinary press. Line-engraving, mezzotinto engraving, aquatint, and etching present the design or picture in *intaglio* on a metal plate, the lines being cut, and therefore below the surface of the plate; they cannot be printed by ordinary typography, because the ink-roller inks the parts that ought to be left clean, and leaves the lines of the device untouched. Wood-engravings, and stereotypes and electrotypes taken from them, can be printed side by side with type in the same page, and by the same operation; and hence the vast extension of this mode of illustrating books and newspapers. The inventors of *graphotype* are trying to introduce a cheap substitute for engraved wood-blocks. Mr De Witt Clinton Hitchcock, a draughtsman and wood-engraver, having occasion for a little enamel white powder, scraped some from the surface of a visiting-card, and then observed that the ink-lines remained just as distinct and prominent as before, not having been removed by the scraping. This slight accident suggested the new process—sketching the design on a chalky surface, and brushing away the chalk from between the lines. Mr Hitchcock's first experiments were partially successful, and he then received aid from others in establishing a *modus operandi*. In the latest form of the process, after many intermediate experiments, the block is superseded by a zinc plate covered with finely-pounded French chalk, brought to a hard and very fine texture by enormous pressure, with a glossy surface produced by an interposed steel plate. On this white surface, sized and dried, the picture is drawn with camel or sable hair pencils, dipped in an ink made of glue and lampblack. When dry, the white or uninked portions are rubbed down by means of a small fitch-hair brush, and pads covered

Digitized by Google

with silk velvet. The rubbing is continued until the white is sunk sufficiently below the level of the inked picture or design. The plate is then saturated with liquid glass or silicate of soda, which converts the French chalk into a kind of marble. The success with which all the white is rubbed down between the inked lines, depends on a variety of circumstances—the hardness of the white, the evenness of the surface, the completeness of the petrifying action by the silicate, the protecting power of the ink or varnish, the quality of the brushes and rubbing-pads, and the careful management of the rubbing itself. Whether the fine lines of the device can be preserved from breaking up into saw-like irregularities, and whether the numerous requirements and qualities of a wood-engraving can be successfully realised, a long course of trial can alone shew. The matter has been taken up by a company.

GRA'PPLE-PLANT (*Uncaria procumbens*), a procumbent plant of the same genus with the Gambir (q. v.), a native of South Africa. The seed-vessel has many hooked thorns, and clings most tenaciously to any animal—a provision for the distribution of the seed. When it lays hold of the mouth of an ox, Livingstone says, the animal stands and roars with pain and a sense of helplessness.

GRA'PPLING-IRON or Grapnel, a sort of small anchor, having several pointed claws, used generally in making fast boats and other small vessels. A similar instrument of more formidable dimensions is employed during action for grappling the rigging of a hostile ship preparatory to boarding.

GRA'PTOLITES, a group of fossil zoophytes, apparently nearly related to the recent Sertularia. They had simple or branched polypidoms, formed of a horny substance. The cells in which the polype lived were arranged in a single series on one side of the rachis, or in a double serie on both sides; the rachis was generally prolonged beyond the cells at the growing end of the polypidom. Egg capsules have been observed attached to the polypidom, exhibiting a method of reproduction similar to that in the hydroid zoophytes. The generic division of the graptolites has been based on the arrangement of the cells.

Nearly eighty species of graptolites have been described. They are confined to the Silurian strata, and are most abundant in the hard slaty shales, which were the fine mud of the Silurian seas.

GRA'SLITZ, a small town of Bohemia, is situated on the border of Saxony, 20 miles north-north-east of the town of Eger. It has manufactures of cotton goods, paper, looking-glasses, musical and mathematical instruments, and machinery. Pop. (1869) 6549.

GRA'SMERE, the name of a village and lake in Westmoreland, about three miles north-west of Ambleside. The village, which is beautifully situated at the head of the lake, has an ancient church, containing Wordsworth's grave, which is marked by a plain and modestly fashioned slab. The lake is upwards of a mile long, and about half a mile broad, is oval in form, and encloses a small island. It is girdled about by high mountains, and forms one of the most beautiful scenes in England. Pop. (1871) 805.

GRASS (in Law). The grass growing on land belongs to the person entitled to the soil, and at his death goes to the heir, and not to the executor. The period of entry as to grass-farms in Scotland is Whitsunday. Where the cattle of strangers are put into the fields of a tenant in Scotland to graze, the landlord cannot sequestrate the cattle for his rent; whereas, in England, he may distrain the cattle, and pay himself the rent.

GRASS CLOTH, a name often, though erroneously, given to certain beautiful fabrics manufactured in the East from different kinds of fibres, none of which are produced by grasses. One of these fabrics is made from the fibre of *Bœhmeria nivea*, popularly called China-grass; another, also known as *Pina Muslin*, from the fibre of *Bromelia Pinna*. See BŒHMERIA and BROMELIACEÆ.—The kinds of cloth really made from the fibre of grasses are extremely coarse.

GRASS OF PARNA'SSUS (*Parnassia*), a genus of plants, generally regarded as belonging to the natural order *Droseraceæ*, but referred by Lindley to *Hypericaceæ*. The calyx is deeply 5-cleft, there are 5 petals, 5 stamens, and 5 scales fringed with globular-headed threads alternate with the stamens, which are regarded by Lindley

Digitized by Google

as bundles of altered stamens; there are four stigmas, and the fruit is a 1-celled, 4-valved capsule with many seeds. The genus consists of a few small herbaceous plants, with flowers of considerable beauty, growing in wet situations in the colder northern parts of the world. Some of them are found within the arctic circle, and to the snow-line of the Alps, Himalaya, and other mountains. The common Grass of Parnassus (*P. palustris*) is an ornament of bogs and wet places in Britain and other parts of Europe, with heart-shaped eaves, mostly radical and on long foot-stalks, and one sessile leaf on the stem, which is about eight or ten inches high, and bears a solitary yellowish-white flower. It flowers in autumn. It is called *Agrostis ea to Parnasso* by Dioscorides, whence its modern name.

GRA'SS-MOTH (*Crambus*), a genus of small moths, allied to the Clothes-moths, of which the species are numerous, inhabiting pastures, where they are often seen to rise in great numbers when disturbed, and soon to settle again on the blades of grass. Their form, when their wings are closed, is long and narrow, pointed at the head, abruptly cut off at the opposite end. They are often brown and white, sometimes silvery and golden.

GRASS OIL, a fragrant volatile oil obtained from the leaves and stems of certain grasses of the genus *Andropogon* (see LEMON GRASS), natives of India. The kind known as *Grass-oil of Nemaur* is produced at the foot of the Vindhya Hills, and is exported from Bombay. It has been ascribed to the grass called Vittievayr or Cuscus (*A. muricatus*); to another species, which Dr. Royle supposes to be the *Calamus Aromaticus* of the ancients; and to a third, also like these, a very fragrant grass (*A. Iwarancusa*). It is not improbable that it may be obtained from more than one species. It is obtained by distillation; the grass, being cut when it begins to flower, is bound in small bundles, which are thrown into a boiler with water, and the oil, as it distils over, is received in cold water, from which it is afterwards skimmed. It is of a light straw color, has a peculiar rich agreeable color, and is very pungent and stimulating. It is employed in medicine, as a stimulant and diaphoretic, but more frequently as a liniment in chronic rheumatism. Its chief use, however, is in perfumery. It is sometimes called *Ginger-grass Oil*, but is commonly called *Oil of Geranium* by perfumers, and by druggists *Oil of Spikenard*.—Similar to this, but different, and obtained from other species of the same genus, is the oil known as Oil of Lemon Grass.

GRASS TREE (*Xanthorrhœa*), a genus of plants of the natural order *Liliaceæ*, natives of Australia, and constituting a very peculiar feature in the vegetation of that part of the world. They have shrubby stems, with tufts of long wiry foliage at the summit, somewhat resembling small palms; a long cylindrical spike of densely aggregated flowers shooting up from the centre of the tuft of leaves. The base of the inner leaves of some species is eatable, and forms, particularly when roasted, an agreeable article of food. It has a balsamic taste; and all the species abound in a resinous juice, which, on exposure to the air, hardens into a reddish yellow inodorous substance with a shining fracture, soluble in alcohol, and useful as a tonic in dysentery, diarrhœa, and other intestinal maladies; used also by the natives of Australia for uniting the edges of wounds, and with an aluminous earth for caulking their canoes, and as a cement for various purposes. The common grass tree (*X. hastilis*) has a stem about four feet high, but sometimes a foot in diameter. It is of very slow growth, and is supposed to be many centuries old when it has reached such dimensions.—Several species are found in Eastern Australia, where their leaves are used as fodder for all kinds of cattle.

GRASSE, a manufacturing town of France, in the department of Alpes-Maritimes, is situated in the midst of flower-gardens, on the southern slope of a hill, 23 miles east-north-east of Draguignan. The streets are steep, narrow, and crooked, but the houses are well built. The principal buildings are the college, hospital, and ecclesiastical school. G. is second only to Paris in its manufactures of essences and perfumes, made from the roses, orange-flowers, heliotropes, mint, &c., which, from the mildness of the climate, are most successfully grown in the vicinity. It has also manufactures of woollen goods, soap, leather, and olive oil; several silk-spinning factories and tanneries; and a considerable trade in oranges, citrons, wax, and honey. Pop. (1872) 8382.

GRASSES (*Gramineæ* or *Graminaceæ*), a natural order of endogenous plants, containing almost 4000 known species, about one-twentieth of all known phanerogamous plants; whilst the *social* habit of many of them, and the vast number of individual plants within even a limited tract, give them a still greater proportion to the whole phanerogamous vegetation of the earth. They are distributed over all parts of the world; some are characteristic of the warmest tropical regions, and some of the vicinity of perpetual snow; but they abound most of all, and particularly in their social character, clothing the ground with verdure, and forming the chief vegetation of meadows and pastures, in the northern temperate zone. There is no kind of soil which is not suitable to some or other of the grasses; and whilst some are peculiar to dry and sterile soils, others are only found on rich soils with abundant moisture; some grow in marshes, stagnant waters, or slow streams, some only on the sea-coast; none are truly marine. Some grasses are annual, and some perennial; they have fibrous roots; the root-stock often throws out runners; the stems (*culms*) are round, jointed, generally hollow, except at the joints, rarely filled with pith, generally annual, and of humble growth, but sometimes perennial and woody, occasionally—as in bamboos—attaining the height and magnitude of trees. The leaves are long and narrow, alternate, and at the base sheath the culm; the sheath is split on the side opposite to that from which the blade springs; and at the junction of the blade and sheath, there is often a short membranous prolongation of the epidermis of the sheath, called the *ligule*. The flowers are generally hermaphrodite, but sometimes unisexual, and more frequently so in the grasses of tropical than in those of colder climates; they are disposed in *spikelets*, and these again generally in spikes, racemes, or panicles; they have no proper calyx nor corolla, but consist of the parts of fructification enclosed in two series of small bracts, some or all of which are sometimes awned. See AWN. The two outer bracts of each spikelet are called *glumes*. In some grasses, only one glume is properly developed for each spikelet. Within the glumes are the *florets* forming the spikelet, sometimes only one, but often a larger number, each floret having generally two small bracts called *palee* or *gluмellæ*, the immediate covering of the parts of fructification. The glumes were called the calyx by the older botanists, and the palee the corolla, but inaccurately. The stamens are hypogynous, sometimes only one, sometimes six or more, but very generally three, the anthers attached to the filaments by the middle of their back, and easily moved by the slightest breeze. The ovary is simple, one-celled; the styles two or three, sometimes united; the stigmas feathery or hairy. The fruit is a *caryopsis*, the pericarp being incorporated with the seed; the seed consists of a small embryo, lying at the base and on the outside of a large farinaceous albumen, from which arises in great part the extreme importance of this order of plants to man; the farinaceous seeds of some of the grasses being the corn or grain which forms a chief part of human food. The grasses cultivated on this account are noticed in the article CEREALIA and in separate articles. Starch is the principal substance entering into the composition of these farinaceous seeds, and is often extracted from them, either to be used by itself as an article of food, or for other economical purposes, according to the kind. Besides starch, they contain, in greater or less proportions, gluten and other similar substances, on which not a little of their nutritive value depends. The peculiarities of composition of the most important grains are noticed in the article BREAD, or under their separate heads. When, by the process of *malting* (see BEER), great part of the starch of the grain has been converted into sugar, a fermented liquor is made from it, of which BEER or ALE made from barley is the most familiar example; and from this, again, a spirituous liquor—as whisky—is obtained by distillation. Fermented and spirituous liquors are commonly made from different kinds of grain in different parts of the world, particularly barley, maize, rice, and millet.—SUGAR is another important product of grasses, existing in large quantity in the stems of many species, and particularly abounding in the soft internal part of some, as Sugar-cane, Maize, and Shaloo or Sugar-grass (*Sorghum saccharatum*, see DURRA), from which it is extracted for use. The sugar-cane yields far more sugar than all the other plants cultivated on that account in the world. Rum—obtained by fermentation and distillation from sugar—is another well-known product of the sugar-cane, and similar liquors may be obtained from the other sugar-producing grasses.—Besides these uses, grasses are also of great importance as affording pasture and fodder (*hay* and *straw*) for cattle. See FODDER.—The woody stems of the larger grasses are

Digitized by Google

applied to a great variety of economical purposes. See BAMBOO. Those of some of the smaller grasses are much used for thatch, and are also made by plaiting into straw-hats, ladies' bonnets, &c. See STRAW-MANUFACTURES.—The underground runners of some species, as the Marrum Grass and Sea Lyme-grass, make them particularly useful for binding and fixing loose sands.—The stems and leaves of many grasses have fibres of such length and strength that they are twisted into coarse ropes for many purposes in which no great durability is required. Thus, hay and straw ropes are commonly used on every farm in Britain, and different grasses are used in the same way in many parts of the world. Some grasses, as the Moonja (*Saccharum Munja*) of India, are not simply twisted into ropes, but their fibres are first separated by moistening and beating; and the fibres of some, as the Esparto (q. v.) of Spain, are made not only into ropes, but into mats, sacks, and other very coarse fabrics.—The Chinese make paper from the young shoots of bamboo; paper is also made from the straw of rye, wheat, barley, and oats, and might be made from that of many grasses. See PAPER.—The perennial roots and runners of some grasses contain peculiar substances, on account of which they are used medicinally, as those of couch-grass. The stems and leaves of some contain Coumarin (q. v.), and have a very agreeable fragrance when dried, as in the case of the Sweet-scented Vernal Grass (*Anthoxanthum odoratum*) of Britain. A few, chiefly East Indian species, contain other aromatic and fragrant substances in the stem and root, particularly Lemon Grass, Vittievayr, and other species of *Andropogon*, which yield Grass-oil (q. v.).—It has been alleged that the seeds of a few grasses are poisonous, but this in every case requires confirmation, although Darnel (q. v.) in particular has a bad reputation.—The stems, leaves, and glumes of grasses contain a large proportion of silica, particularly the epidermis, so that when large quantities of them are burned, a sort of glass is formed; a fact which requires attention in questions relative to the manures proper for particular crops, and the most profitable alternation of crops in husbandry. The following are the tribes into which botanists have divided the natural order of Grasses, with the names of some of the most important, as examples:

Oryzeæ.	Rice.
Phalareæ.	Maize; Job's Tears (*Coix*); Canary Grass; Foxtail Grass; Soft Grass; Timothy Grass.
Paniceæ.	Millet (of various kinds); Fundi; Guinea Grass.
Stipeæ.	Feather Grass; Esparto.
Agrosteæ.	Bent Grass.
Arundeæ.	Reeds; Marrum Grass; Pampas Grass.
Pappophoreæ.	
Chloreæ.	Cord Grass (*Spartina*); *Cynodon*; *Eleusine.*
Aveneæ.	Oats; Vernal Grass; *Aira.*
Festuceæ.	Fescue; Meadow Grass; Manna Grass; Teff; Cock's-foot Grass; Tussac Grass; Dog's-tail Grass. Sub-tribe *Bambusideæ*—Bamboos.
Hordeæ.	Wheat; Barley; Rye: Spelt; Rye-grass; Lyme Grass.
Rottbœlleæ.	Gama Grass.
Andropogoneæ.	Sugar-cane; Shaloo or Sugar Grass; Dura; Lemon Grass; Vittievayr.

The word *Grass* is probably from the same root as Lat. *cresco*, Eng. *grow*.

Among farmers, the term grasses is extended to include, along with the true grasses, other plants cultivated for fodder and forage, such as clover, &c., and these are distinguished by the term *Artificial Grasses*, whilst the true grasses are called *Natural Grasses.*

GRA'SSHOPPER, the English name of many species of insects, forming a family of the order *Orthoptera*, section *Saltatoria*, called *Gryllidæ* by some (chiefly English) entomologists, and *Locustidæ* by others—those who adopt the former name designating the Crickets (q. v.) *Achetidæ*. Locusts (q. v.), however, do not belong to this family, although very closely allied, but are distinguished from it by greater robustness of frame, shorter legs and shorter antennæ. The antennæ of the grasshoppers are long and threadlike, as in the crickets. The wings of grasshoppers, as of locusts, fold together like the sides of a roof, whilst those of crickets are hori-

Digitized by Google

zontal when at rest. Grasshoppers, like crickets and locusts, have the thighs of the hinder legs very large and adapted for leaping. But grasshoppers do not leap with so great energy as locusts, nor are they capable of so sustained a flight. There are, indeed, some of the family in which the wings are merely rudimental, and the elytræ or wing-covers of small size. Most of them, however, have well-developed wings; and the wing-covers of the males, as in crickets, have a spot at the base of a talc-like appearance, by the rubbing together of which that chirping sound is produced which is probably connected with the sexual instincts of the insects, but which we have learned to associate with the brightest of green pastures and of sunshiny days. Grasshoppers are herbivorous. They are numerous in most parts of the world. The largest British species is the GREAT GREEN G. (*Gryllus viridissimus*, also known as *Locusta viridissima*, and *Acrida viridissima*), about two inches in length, and of a fine green color; a somewhat rare insect in Britain, although not uncommon in some parts of Europe. A green color prevails among the grasshoppers of Britain, and generally of temperate climates, enabling them more readily to elude observation among the herbage in the midst of which they live; but some of the tropical species are richly colored, and some have very large wings, almost like those of lepidopterous insects. The greater number of grasshoppers feed on grass and the leaves of herbaceous plants, but some prefer the leaves of trees.

GRA'SSUM, in the law of Scoland, is a lump sum paid by persons who take a lease of landed property. In the case of entailed estates, the heir in possession is generally prohibited from taking large sums in the form of a grass-um, and letting the property at a lower rent, because it tends to prejudice those who succeed him in the property. In England, the word is not used, but the word premium in some cases, and fine in others, means the same thing. Where a person is entire owner or freeholder, he is entitled to let his land at any rent he pleases, and to stipulate for a grassum as large as he can get.

GRASSWRACK, (*Zostéra*), a genus of plants of the natural order *Naiades*, one of the few genera of phanerogamous plants which grow amongst sea-weeds at the bottom of the sea. The leaves are narrow and grass-like; and the flowers consist merely of stamens and pistils, without any perianth, inserted on the central nerve of one side of a flat thin linear *spadix*, with a leafy *spathe*. The pollen is confervoid.—The common grass-wrack (*Z. marina*) is a perennial plant, which forms green meadows on the sandy bottom of shallow parts of almost all the European seas, and abounds in creeks and salt-water ditches. It is found in great plenty on the British shores. It becomes white by exposure to the air. The rush-like coverings of Italian liquor-flasks are made of it, and is much used for packing glass bottles and other brittle ware. It has been long used in Holland, Gothland, and Iceland for stuffing pillows and mattresses, and this use has of late years very much extended, so that the plant has become an article of commerce, under the name of *Alga marina*, or more commonly, but incorrectly, *Alva marina* (Ger. *Seegrass*).

GRATE, the iron cage which supports the coal for a common fire. Considerable improvements have been made of late years in the construction of common domestic grates. Our forefathers simply added an iron cage to the old form of fireplace built originally for burning a pile of wood. This was a large square-sided recess, with a very wide opening for the chimney. Count Rumford pointed out the disadvantages of this, and the principles upon which they should be remedied. See CHIMNEY. In the modern grate, the filling up of the square cavity recommended by Count Rumford, and also his plan of lowering and narrowing the throat of the chimney, are usually effected by iron plates forming part of the grate. These plates are readily heated, and with equal readiness radiate and reflect the heat into the room, and thereby effect a considerable saving of coal, besides which the grate itself is brought forward level with, or even projecting beyond, the walls of the room, whereby the radiation from the heated coal is utilised to the utmost. One of the most effective as well as elegant forms of grate is that which consists simply of a large square iron plate set nearly flush with the wall, in the middle of which is a hemispherical cavity with bowed bars in front, and a trapped opening into the chimney in the upper part of this cavity. When there is a fair draught, this form of grate gives a

Digitized by Google

good fire, and effects the maximum economy of fuel for an open fireplace (which of course is always somewhat wasteful compared with a stove). The curved surface behind and above the fire radiates and reflects into the room from every part of its surface, and the plate flush with the wall, which is heated by conduction, may be regarded as a part of the room, and thus the main condition of economy is effected, viz., throwing as much as possible of the heat into the room, and allowing as little as possible to go up the chimney. A lining of firebrick or of fireclay, moulded to the form of the back of the grate, is useful in retaining the heat which is necessary for complete combustion of coal; the firebrick, being a bad conductor and an excellent radiator, becomes red-hot on its surface next to the coal, and this heat is not carried away, but is radiated into the fire, and assists in burning the carbon of the smoke. The conditions for securing an effective draught are treated under CHIMNEY.

GRA'TIAN, the collector of the well-known body of canon law which is commonly cited under the title of "Decretum Gratiani." It is singular, however, that although few authorities have been so frequently cited, or have obtained so wide and permanent acceptance as this celebrated collection, hardly anything is known of the collector's own personal history. The sum of our knowledge regarding him is, that he was a native of Chiusa in Tuscany, and that he became, in later life, a Benedictine monk of the monastery of St Felix in Bologna. The date commonly assigned to G.'s collection is 1141 or 1151; its title, however, "Decretum," or "Concordia Discordantium Canon," is believed to be of later origin. How far the collection is the work of G. himself, or how far he was indebted for his materials, and even for their arrangement, to the labors of earlier collectors, it is difficult to determine. The work consists not only of the decrees of councils and popes down to Innocent II. (including the spurious ISIDORIAN DECRETALS, (q. v.), but also of passages from the Scripture, from the Fathers, and even from the Roman law. It is divided into three parts. The first regards the hierarchical constitution of the church, and chiefly relates to doctrinal and moral subjects. It is divided into "distinctions." The second treats of external jurisdiction, under the head of "causes" and "questions." The third regards the inner life of the church—the liturgy and the sacraments. From what has been already said regarding his adoption of the Isidorian decretals, it will be inferred that in point of criticism G.'s authority is of little value, and, in general, it may be added that no authority is given to any document beyond what it intrinsically possesses, from the fact of its being placed in G.'s collection. For the other collectors of the canon law, see CANON LAW. The date of G.'s death is unknown.

GRATIA'NUS, Augustus, eldest son of Valentinian I., by his first wife Severa, was born at Sirmium in Pannonia, on the 19th of April 359 A.D. While he was still *nobilissimus puer* (or heir-apparent), he was created consul, and in 367, was elevated by his father to the rank of Augustus at Ambiani, or Amiens, in Gaul. In the following year, he accompanied his father in his expedition against the Alemanni, in order that he might be accustomed to warfare. On the death of Valentinian, the troops elevated G. to the throne, giving him at the same time as a colleague his half-brother Valentinian II. Gaul, Spain, and Britain fell to G.'s share; and as his brother was only four years old, G. is supposed by many authorities to have been the monarch *de facto* of the rest of the Western Empire, fixing his residence at Treviri (now *Treves*). During the first part of his reign, a fierce warfare was carried on against the tribes who possessed the Danubian provinces and Illyricum; and he was on the point of marching into Thrace, to assist his uncle Valens against the Goths, when he was suddenly called upon to defend his dominions against the Lentienses, a tribe of the Alemanni. After the invaders had been defeated, G. advanced towards the Eastern Empire, but while on the way, he learned that his uncle Valens had been defeated and killed by the Goths near Adrianople (August 378). The sovereignty of the Eastern Empire then devolved upon G., but feeling his inadequacy to the task of ruling the whole empire, he recalled Theodosius (q.v.) from Spain, and appointed him his colleague on the 19th January 379. G. possessed some admirable virtues: he was pious, chaste, and temperate; his understanding was well cultivated, although not strong, and his eloquence attractive. But his character was too yielding and pliant, and he was consequently often led to the commission of gross acts of cruelty

Digitized by Google

and tyranny, utterly foreign to his nature. His persecution of the pagans, and afterwards of heretic Christians, made him a great favorite with orthodox ecclesiastics, but rather alienated the affections of his subjects generally, while his fondness for frivolous amusements, and unworthy associates, excited the contempt of the army, so that when Maximus was proclaimed emperor by the legions in Britain, crowds of the disaffected flocked to his standard. G. was defeated by him near Paris, and afterwards fled to Lyon, where he was overtaken and killed by Andragathius, whom Maximus had sent in pursuit of him, on the 25th August 388.

GRATI'OLA, a genus of plants of the natural order *Scrophularineæ*, having a 5-partite calyx, the upper lip of the corolla bifid, the lower trifid, only two stamens fertile, and the anthers pendulous. *G. officinalis*, sometimes called HEDGE HYSSOP, is found in meadows and on the margins of ponds and river-banks in most parts of Europe, but not in Britain. It has sessile lanceolate serrulated leaves and axillary solitary flowers. It is extremely bitter, acts violently as a purgative, diuretic, and emetic; and in overdoses is an acrid prison. It is administered in cases of worms, jaundice, dropsy, scrofula, mania, and venereal diseases; but requires to be used with caution. It is said to render some of the Swiss meadows useless as pastures. It was formerly so highly esteemed as a medicine, that the name of *Gratia Dei* (Grace of God) was given to it, and for the same reason it is known in France as *Herbe au Pauvre Homme* (Poor Man's Herb). It is said to be the basis of the famous gout medicine called *Eau medicinale.*—*G. Peruviana*, a South American species, has somewhat similar properties. These properties are supposed to depend upon a bitter resinous principle called *Gratioline.*

GRATTAN, the Right Honorable Henry, was born in Dublin 3d July 1746. His father was recorder and M.P. for that city until his death in 1766. The year after that event, having completed his university studies with distinction at Trinity College, Dublin, G. entered as a student of law at the Middle Temple, London, where, however, he neglected the pages of Blackstone, to listen to the living oratory of parliament, and in particular of Lord Chatham. In 1772, he was called to the Irish bar, and in 1775 was returned to the Irish parliament as representative for the borough of Charlemont, for which he sat until 1790, when he was elected as one of the representatives of the city of Dublin, to such an extent had his patriotism and eloquence recommended him to the Irish people. Mainly to him was owing, among other things, the partial abolition of the heavy restrictions on Irish commerce. But his popularity ebbed as it had flowed (and oftener than once) in the hearts and huzzas of his impulsive and therefore inconstant countrymen. In 1797, he declined to come forward for Dublin, and went into temporary but undeserved eclipse. In 1800, he was returned for the borough of Wicklow, to oppose the Union, and that was to fight for the people's idea of the constitution. But the union was effected in spite of him, and in 1805 he was returned to the imperial parliament for the borough of Malton, in Yorkshire. Next year, he was induced to stand for Dublin, and was re-elected. He sat for it in successive parliaments till his death, which happened on 4th June 1820, in London, to which he had gone when in a weak state of health, contrary to the advice of his physician, to advocate, as he had been wont, the cause of Catholic emancipation.

G.'s public and private character was unimpeachable. For the vacillations of his popularity in Ireland, his countrymen had reason to be ashamed, and it is certain that he now holds a proper and exalted place in the esteem of the people, for whom he labored with such sincerity, integrity, and genius. The history of his life is in great measure the history of the Irish constitution, and entirely the history of the parliament of Ireland. His "Life and Times" was published by his son.

As an orator, he stands in the first rank. His style is full of point, rapidity, antithesis, and poetic suggestiveness. His eulogy on Chatham, and his invective against Bonaparte, are not surpassed in British eloquence. Byron declares him to be an orator—

> With all that Demosthenes wanted, endowed,
> And his rival or master, in all he possessed.

His speeches were published by his son and biographer. A statue of G., on College Green, Dublin, was unveiled in 1876.

GRATU'ITOUS DEED, in the Law of Scotland, means a deed granted without any value received. If it is made in favor of a third party, in order to defeat creditors, it is null and void, by stat. 1621 c. 18. There is this peculiarity, also, that when a person is too generous, and contracts voluntarily to give away property at a future period, if he become destitute in the meantime, the court will, at least where the deed was in favor of children or grandchildren, retain sufficient for his own subsistence. This is in imitation of the Roman law as to *beneficium competentiæ*, but the Roman law went further. Such a provision is wholly unknown in England. In England, gratuitous deeds are usually styled Gifts (q. v.) or Voluntary Conveyances (q. v.), according to circumstances.

GRÄTZ, the capital of the crown land of Styria, in Austria, is a picturesque old town, built on both sides of the Mur, and encircled by fine gardens and pleasure-grounds. It is 140 miles south-south-west of Vienna, by the Vienna and Trieste Railway. The civil population amounts (1869) to 80,782. The inner town, which is connected with the suburb on the western side of the river by two chain and two wooden bridges, is surrounded by walls and by a promenade (formerly the glacis) shaded with trees, has narrow and crooked streets, and is not remarkable for cleanliness. It is worthy of notice, however, from the number of old buildings which it contains, as the cathedral of St. Agidi, built in the 14th c.; the ancient castle of the Styrian dukes, which possesses many curious relics of antiquity; the Landhaus, where the nobles of the duchy held their meetings; the university, founded in 1585, with its library containing 70,000 volumes; its museum, &c., the arsenal, and various palaces belonging to the Styrian nobility. G. is well provided with gymnasia and other public educational establishments for the laity, and seminaries for the clergy. As the seat of government for the circle, G. has special courts of law and administration, and is a place of considerable importance. It has important manufactures of steel and iron wares, cotton, linen, and woollen fabrics, leather, paper, saltpetre, &c. From its position on the direct line of railway-communication between Vienna and Trieste, it is favorably situated as an intermediary station for the trade of the Austrian capital and the Adriatic provinces. G. is the residence of a prince-bishop, and has, besides a Protestant church and a synagogue, 23 Catholic churches, some of them very ancient. The country round about G. is singularly beautiful and picturesque.

GRAU'DENZ, an old town and important fortress of Prussia, in the province of West Prussia, stands on the right bank of the Vistula, 60 miles in direct line south of Danzig. A bridge of boats, 2780 feet in length, here crosses the river. G. contains numerous seminaries and educational establishments. It carries on a trade in corn and tobacco, and manufactures of woollens and cottons, &c. The town is fortified by a wall; and about a mile north of it on a hill, and in a position that commands the course of the Vistula, is the bombproof fortress of Graudenz. Pop. (1871) 15,559, including the garrison.

GRAU'WACKE. See GREYWACKE.

GRAVE ROBBING. The offence of taking up dead bodies has often been attempted to be declared felony by act of parliament; but is only a misdemeanor, punishable by fine and imprisonment. If, however, the shroud, coffin, or any property in the nature of a chattel is taken away from the grave, the party may be indicted for felony in stealing these. See ANATOMY (in Law).

GRAVE STONES. The right to grant or refuse permission to erect grave stones, tombs, or monuments in the church or churchyard, in England, is vested in the ordinary, who is generally the bishop. In Scotland, a similar power is vested in the heritors, i. e., the proprietors of the lands in the parish.

GRAVEL, the name given to aggregations of water-worn and rounded fragments of rocks, varying in size from a pea to a hen's egg. When the fragments are smaller, the deposit is sand; when larger, it is called shingle. Beds of gravel occur in formations of every age. While the materials have been a long time in being prepared, and have travelled perhaps a great distance from the mother-rock, gravel deposits have been formed speedily and by the action of a strong current of water. They form very irregular and limited deposits, occurring generally as banks or hummocks in strata of sand. Unless in the most recent deposits, they almost always form a

Digitized by Google

hard rock called conglomerate or puddingstone, the pebbles being compacted together by some infiltered current, which is most frequently iron, lime, or silex. Even so recent as the Glacial period, gravels are sometimes formed into a compact concrete, though these and later deposits are generally loose. Mr Prestwich has divided the Pleistocene gravels into "High Level" and "Low Level Gravels." The high level gravels are the more ancient. They have been deposited subsequently to the formation of the present valleys, but apparently at a time when there was much more water in the valleys than there is now. The low level gravels have been produced by the present rivers.

GRAVEL. See CALCULUS.

GRAVELINES, a small fortified town and seaport of France, in the department of Nord, is situated in a marshy locality at the mouth of the Aa, 12 miles south-west of Dunkerque. Although now a desolate-looking town, with grass growing in its streets, it is of importance in a historical point of view. Here the Count d'Egmont obtained a victory over the French army commanded by the Marechal de Thermes in 1558; a victory which compelled the French to accept the severe conditions of the peace of Cateau-Cambrésis. Ten years later, it was taken by Louis XIV., who had it fortified by Vauban. The inhabitants are employed chiefly in the herring and cod fisheries, and the trade in liqueurs, timber, salt-fish, &c. The harbor has now become useless from neglect. Pop., with garrison (1872), 3818.

GRAVESEND, a market-town, municipal borough, and river-port of England, in the county of Kent, is situated on the right bank of the Thames, 38 miles west-north-west of Canterbury, and 24 miles east-south-east of London by the North Kent Railway. It occupies a somewhat commanding position on the first rising ground after entering the river; and consists of the old town, with narrow, inconvenient, and not too cleanly streets, and of the new town, west of the older portion, with handsome streets, squares, and terraces. G. is not famous for its architecture. In the vicinity are extensive market-gardens, great part of the produce of which is sent to London. Many of the inhabitants are employed in fishing. G. forms the limit of the port of London. Here pilots and custom-house officers are taken on board of vessels going up the river. For centuries, the prosperity of the town has depended on its connection with the metropolis. The salubrious air and beautiful scenery at G. render it a favorite watering-place with Londoners. It carries on some ship-building and a considerable trade in supplying ships' stores. Population of municipal borough (1871), 21,260; of parliamentary borough, 27,493.

G. was originally a *hythe*, or landing-place, and is mentioned as such in Domesday. Around this landing-place a town grew up soon after the Conquest. Here the fleets of the early voyagers, as that of Sebastian Cabot in 1553, and of Martin Frobisher in 1576, used to assemble; and here the lord mayor, aldermen, and city companies were wont to receive all strangers of eminence, and to conduct them up the river in state, forming processions, which, says the historian Froude, were "spectacles scarcely rivalled in gorgeousness by the world-famous weddings of the Adriatic."

GRAVI'NA, a commercial and industrious episcopal town in the south of Italy, in the province of Bari, is situated on a hill above the left bank of a stream of the same name, 37 miles south-west of the town of Bari. It contains about 10,500 inhabitants, and occupies the site of ancient *Blera*, one of the stations on the Via Appia, which passed at Poggio Orsino, about a mile from the town. In 996, it sustained a memorable siege against the Saracens. It was a favorite hunting-place of the Emperor Frederick II. The neighborhood possesses rich pastures, and raises a celebrated breed of horses, in which the inhabitants do a large trade at their annual cattle-fair.

GRAVITA, an Italian term used in music, signifying that it is to be performed with an earnest and dignified expression, while the movement progresses in a slow, marked, and solemn time.

GRAVITATION, Gravity. All bodies, when raised into the air, and left unsupported, fall to the earth in lines perpendicular to it. The force which causes them to do so is termed gravity, and, universal experience shews, acts towards the earth's centre; more strictly, it acts perpendicularly to the surface of still water.

Digitized by Google

But if a body, as a stone, be projected obliquely into the air, it is made to describe a curved path, having a highest point, vertex, or apogee; and when it meets the earth in its descent, its direction is not towards the centre, but inclined to it at the angle of projection. See PROJECTILES. Observing this, and that the body, if not interrupted by the earth's surface, would continue to move in a curve, with its tangent always away from the centre, it is easy to imagine that if not interrupted, it might circulate round the centre as the moon does round the earth. Next, knowing that the force of gravity is exerted at all accessible heights above the earth, the question arises—May it not be exerted as far off as the moon? which we know to be influenced by *some* force which continually deflects her from the tangent to her orbit, and makes her circulate round the earth. See CENTRAL FORCES. Observing now the time of revolution of the moon, and calculating its centrifugal force, which we know must equal the centripetal force, we put the question: Is this force the same as gravity? The answer is, that it is a force 3600 times less energetic. If, then, gravity be the force which really holds the moon to her path, it must be explained why it acts upon her so much more feebly than it would, were she a body on the earth's surface. The explanation is given at once if we suppose gravity to be a force whose energy diminishes with increase of distance, and is inversely as the squares of the distances at which it is exerted; for the distance of the moon from the earth's centre is just about 60 times that of the earth's surface from its centre, and $3600 : 1^2 :: 60 : 1$. We infer that it does so from the fact, that there is nothing inadmissible in such a diminution of energy with increase of distance—that, on the contrary, there are many analogies for it, as in the emanations of light and heat; and in the argument drawn from the necessity of otherwise supposing some other force than gravity to be employed in deflecting the moon, and the force of gravity to cease at some unknown level. On these views, and a generalisation to be afterwards mentioned, Newton is understood to have at first rested his law of universal gravitation: "Every particle of matter in the universe attracts every other particle with a force directly proportioned to the mass of the attracting particle, and inversely to the square of the distance between them"—a law, the truth of which, since it was first broached, has been put beyond all question by the most complete body of predictions, fulfilled to the letter, that can be cited in support of any law of nature.

Before, however, the argument on the extension of terrestrial gravity to the sphere of the moon could have become pregnant with so great a result, much investigation had to take place in other fields; and, in fact, Newton had, previously to conceiving the law, explained the three great Keplerian laws of order obtaining in the solar system by reference to an attractive force residing in the sun. These laws are—1. That the planets revolve round the sun in ellipses, having the sun for a common focus: 2. That every planet moves in such a way that the line drawn from it to the sun sweeps over equal areas in equal times: 3. That the squares of the times occupied by the several planets in their revolutions in their elliptic orbits, are proportional to the cubes of their mean distances from their common focus, the sun. From the law of equal areas, Newton inferred that every planet is retained in its orbit by a force of attraction directed towards the centre of the sun; from the orbits being elliptical, he inferred that in each case this force varies in intensity according to the inverse square of the bodies' distance from the sun; while from the third law he inferred the homogeneity of the central force throughout the solar system. It was then, after being familiar with the notion of terrestrial gravity, and its action, through the researches of Galileo, Huyghens, and Hooke, and with the notion of a central force acting inversely as the square of the distance of its object, through his explanations of the laws of Kepler, that he put to himself the question: Is not the force with which the moon gravitates to the earth the same with gravity?—the force which causes a stone to fall on its surface. A question answered affirmatively on the supposition of gravity, like the sun's attraction, being a force diminishing with increase of distance, and according to the same law. The result was to bring the whole solar system, the planets and the sun, and satellites and their planets—the satellites being observed to obey the same laws of order with reference to their primaries that the latter obeyed in reference to the sun—under the law of gravitation. And the imagination lifted up by the grandeur of the conception, would refuse to limit the operation of that law to our own system, were there no facts to entitle us to extend it beyond. The phenomena of double stars, however,

Digitized by Google

of themselves justify the extension and the statement of the law as we have given it in universal terms. It may be observed, in conclusion, that the Keplerian laws, which may be said to have been the basis of Newton's researches, are, owing to perturbations caused by the mutual action of the planets, &c., only approximately correct; and that these perturbations afford, when examined, a further proof of the truth and universality of the law of gravitation.

For a notice of speculations as to the nature of the law of gravitation, see FORCE; see also FALLING BODIES, PROJECTILES, &c.

GRAVITY, Specific. See SPECIFIC GRAVITY.

GRAY, a small town of France, in the department of Haute-Saône, is situated on the slope of a hill overlooking a beautiful meadow, on the left bank of the Saône, 26 miles west-north-west of Besançon. It is commanded by the remains of an ancient castle, the residence in former times of the Dukes of Burgundy, and has a pleasing appearance from a distance, although its streets are crooked, narrow, and steep. G. is an important entrepôt for goods from the north-eastern districts of France, which are conveyed by the Saône to the south. Its trade is chiefly in corn, flour, timber, wine, iron, and colonial produce. Pop. (1872) 6389.

GRAY, Asa, an eminent American botanist, born at Paris, Oneida County, New York, November 18, 1810. He took his degree of M.D. in 1831, but soon relinquishing the practice of medicine, he devoted himself, under Professor Torrey, to his favorite study of botany. In 1834 he received the appointment of botanist of the United States' Exploring Expedition; but as a long delay took place before it was ready to sail, he resigned his post in 1837. He was afterwards appointed Professor of Botany in the university of Michigan; but before he had entered upon the duties of that office he was elected, in 1842, Fisher Professor of Natural History at Harvard University, Cambridge, Massachusetts. In addition to his prelections at Cambridge, Professor Gray has delivered some courses of lectures at the Lowell Institute, in Boston. He ranks among the leading botanists, not only of America, but of the age. In his numerous writings he has shewn equal ability in communicating elementary knowledge and in elucidating recondite theories. He came forward at a time when the old artificial systems of botany were giving way to the natural system which has taken their place, and he was the first in America, in conjunction with Dr Torrey, who arranged the heterogeneous assemblage of species upon the natural basis of affinity. In 1836 he published his "Elements of Botany," afterwards enlarged into the "Botanical Text-book;" and in 1838 he commenced, with Dr Torrey, the "Flora of North America," to be completed in three large volumes, but still unfinished. In 1848 appeared the "Manual of Botany for the Northern United States," and the first volume of the "Genera Borealia Americana Illustrata," of which another volume has since been issued. Among his remaining works may be mentioned: "Botany of the United States' Pacific Exploring Expedition, under Captain Wilkie" (1854—1858); "How Plants Grow;" "Lessons in Botany;" "Structural and Systematic Botany;" a revised edition of the "Botanical Text-book," with 1900 illustrations; "Flora of the Southern United States;" "School and Field Book of Botany" (1869); and "Botany for Young People" (1869). Professor Gray has also contributed many papers to scientific periodicals and the transactions of learned societies.

GRAY, John Edward, naturalist, born at Walsall in the year 1800, was educated for the medical profession. In 1821, he assisted his father (who was author of "Supplement to the Pharmacopœia," and other works) in the preparation of his "Natural Arrangement of British Plants," in which, for the first time in the English language, the new method was adopted. In 1824, he entered the British Museum as assistant in the Natural History Department, where he found scope for the employment of his extensive knowledge and accuracy of observation, and in 1840 was appointed Keeper of the Zoological Collections. This important post he retained till his death, to the manifest advantage of zoological science, for the British Museum collections are the most complete in the world: a monument of his persevering activity throughout an active life. His success was partly due to his quickness in seizing the peculiar characteristics of animal forms, which rendered him a good classifier. The Royal Bavarian Academy of Sciences at Munich recognised his ser-

Digitized by Google

vices to science by conferring on him the title of Ph.D. Dr G. wrote much on subjects connected with his department. The mere titles of his books and papers make a long list, numbering more than 500. His zoological and natural history catalogues are not mere lists, but are enriched with synonyms and ample notes, whereby study of particular subjects is greatly promoted. Dr G. did not confine his activity to his special department: he assisted in the formation of some of the most prosperous scientific societies of London: and he was a vice-president of the Zoological Society, and took an active part in its management. He, moreover, claimed to have anticipated Sir Rowland Hill in his proposal for a low uniform rate of postage. He, at various times, gave valuable evidence before parliamentary committees, on the management of the British Museum and other subjects; and he served on the juries of the Great Exhibitions of 1851 and 1862. Dr G. died at his residence in the British Museum, in 1875.

Dr G.'s principal works are: "Illustrations of Indian Zoology," 2 vols. folio; "The Knowsley Menagerie," 2 vols. folio; "Spicilegia Zoologica—on Mammalia, Birds, Reptiles, Fishes, Mollusca, Shells;" a "Synopsis of the Contents of the British Museum;" besides Catalogues of the specimens in the Zoological Department, which have greatly facilitated the study of those collections. He also wrote many scientific papers, which have been published in the "Philosophical Transactions" the "Transactions of the Linnæan Society," the "Encyclopædia Metropolitana," "Annals of Natural History," and the "Reports of the British Association;" the whole comprising a mass of facts and principles highly valuable to naturalists.

In 1826, Dr G. married a lady who rendered him important aid in his studies, and is known as authoress of "Figures of Molluscous Animals, for the Use of Students," a work in five volumes. In 1832, he was elected a Fellow of the Royal Society, and afterwards served on the Council. He was a member of some of the principal societies and academies in England and on the continent.—His late brother, GEORGE R. GRAY, who was an officer in the Zoological Department of the British Museum from 1831 till his death in 1872, was the author of many memoirs on zoology, but is best known as author of "The Genera of Birds."

GRAY, Thomas, an English poet, was born in London on the 26th December 1716. His father, Philip Gray, a money-scrivener, was of a disposition so violent, that his wife was obliged to separate from him; and it was mainly through her exertions that her son was placed at Eton, and afterwards at Cambridge. At Eton, he made the acquaintance of Horace Walpole, the son of the prime minister; and when his college education was completed, he accompanied his friend on a tour through France and Italy. After spending a year in the search of the picturesque and in the exploration of picture-galleries, the friends quarrelled, and G. returned to England, and went to Cambridge to take his degree in civil law. At the university, the greater portion of his life was spent, breathing the serene air of noble libraries, and corresponding with friends, as only the men of that day could correspond. In 1756, in consequence of a practical joke, he removed from St Peter's College to Pembroke Hall. He had a just appreciation of the natural beauty of his native country, and rambled in Scotland, Wales, and the English lake counties. He made notes wherever he went, and wrote copious descriptions of what he had seen to his literary friends. He published his "Ode to Eton College" in 1747, and his "Elegy written in a Country Churchyard" two years afterwards. His "Pindaric Odes" appeared in 1757; but however much they might dazzle the imagination with brilliant imagery, and charm the ear with involved and intricate harmony, they did not touch the popular heart like the "Elegy." On the death of Colley Cibber, he was offered, but declined, the post of poet-laureate. Shortly after he was appointed Professor of Modern History. Fastidious in his tastes, fond of books and lettered ease, indisposed to mingle in the great world, but delighting to comment upon it in letters to friends, blessed with the reputation peculiarly dear to a scholar's heart, comparatively rich, his life glided on embittered but by one enemy—gout. Dining one day in the college hall, he was severely attacked, and after suffering a week, he died on the 30th July 1771, aged 55 years. He was buried by the side of his mother at Stoke near Eton.

The poetry of G., with the exception of the "Elegy"—which everybody knows—has never become popular; yet in its own sphere it is very perfect; delicately if not

Digitized by Google

richly imaginative, curiously studded with imagery; exquisitely finished, like miniatures painted on ivory. But his subjects are often remote, and out of the track of ordinary human feelings.

GRAY, in Heraldry, signifies a badger.

GRA'YLING (*Thymallus vulgaris*), a fish of the family *Salmonidæ*, and of a genus distinguished from salmon, trout, &c., by smaller mouth and much smaller teeth, and by the greater size of the dorsal fin. The scales are also much larger. The G. is found in many streams in England, but is, however, very local; and of two rivers in the same neighborhood, one often contains it, and the other does not. A supposition that it was brought to England by the monks, is unsupported by any evidence. It is found in the Eden and the Esk in Cumberland, in the Clyde in Lanarkshire, and in the Orkney Islands. It is plentiful in many parts of Europe, and equally in Switzerland and in Lapland. It inhabits clear streams, with rocky or gravelly bottoms, and "seems to require an alternation of stream and pool." It will live in clean newly made ponds in hard soil, although it does not breed in them, but will not live in those of muddy bottom. Its food consists chiefly of flies and aquatic larvæ, and is taken by angling in the same manner as the trout. It sometimes attains the weight of four or five pounds. The back and sides are silvery gray, marked with numerous longitudinal dusky streaks; the dorsal fin is spotted, the spots arranged in lines across the fin. The abdominal line is almost straight, the dorsal line is considerably elevated. The G. is greatly esteemed for the table, but requires to be cooked when newly caught, when it has an odor which has been compared to that of wild thyme. It spawns in April or May, and is in the best condition when trout are out of season, in October and November.—There are several other species of *Thymallus*, none of which are British. One of them, *T. signifer*, a very beautiful fish, inhabiting the clear affluents of the Mackenzie River, is called *Hewlukpowak*, or the *fish with the winglike fin*, by the Esquimaux. It is said to afford excellent sport to the angler; although the streams in which it is found are visited by few anglers for mere amusement.

This beautiful fish is very local in its distribution, but is abundant in most of the Scandinavian rivers. Angling for grayling is excellent sport. It rises to the same flies as those which are used for trout; it also takes worms, maggots, and other small larvæ and insects. From July till the end of October are the best months for grayling fishing, but in fine open days they afford sport through the winter.

GRAY'S INN, one of the four Inns of Court having the sole power of calling persons to the degree of barrister-at-law. See INNS OF COURT.

GRAZALE'MA, a small town of Spain, in the province of Cadiz, and situated about 60 miles east-north-east of the city of that name in a strong position on a rocky hill approachable only by a narrow and easily defended ledge, between the Sierra de Ronda on the east, and the Cerro de S. Cristoval on the west. It was compared by the French (a whole division of whom were here repulsed by the inhabitants) to a land Gibraltar. A great deal of smuggling, and, it is suspected, robbery, is carried on by the inhabitants. Pop. 5000.

GRAZIO'SO, an Italian term in Music, meaning with graceful expression.

GREASE, a term of general application to all oily or fatty matters, but generally to those having some degree of solidity, as tallow. It is more specially applied to fatty matters which are so deteriorated with dirt or other impurities as to be unfit for candle-making and other manufactures requiring some degree of purity in the material. Grease is largely employed as a lubricant for machinery, and especially for the wheels of carriages. The grease employed for the axles of carriages and carts consists of the most inferior kinds of grease mixed with a little tar.

In commerce, the term Mures' Greuse is now well known. It is the fat of horses which are killed in large numbers at Buenos Ayres and Monte Video; and their products, consisting of hides, grease, bones, and hair, are largely exported to this and other countries. Owing to the practice of slaughtering the mares chiefly, this particular kind of fat has been designated *Mares' Grease*. It is a very oily fat, and so penetrating, that it is difficult to make casks sufficiently tight to prevent leakage. It is used for lubricating machinery, for which it is well adapted.

RAILWAY GREASE is, in reality, a kind of soap, a small portion of soda being

Digitized by Google

mingled with the materials to effect an imperfect saponification. The object is to prevent the too rapid melting of the material, which, without this precaution, would be excessively rapid, owing to the heat caused by the friction of wheels revolving with such rapidity. It is also made of very superior materials, and consists generally of the vegetable fats called cocoa-nut oil and palm-oil; sometimes animal fat is used. This composition is placed in small metal boxes on the axles, with which they communicate by a small hole, so that as the axle heats the surrounding parts, the grease in the boxes melts, and runs through the little orifice on to the axle. See BEAR'S GREASE.

Various kinds of tallow, fat, dripping, and kitchen-stuff receive the general name of grease, as applied to several manufacturing processes; but the name is now more technically given to the lubricating unguent employed for the rolling-stock of railway companies. While oil is the lubricator for the delicate parts of the locomotive, grease is necessary for the axles of the wheels. So vast is the quantity used, that the annual demand amounts to thousands of tons; and, as the quality is very important, most of the great companies make their own—establishing a marked distinction between the two kinds used for locomotives and for wagons.

Locomotive grease usually consists of tallow, oil, carbonate of soda, and water. Much depends on the consistency. If the grease is too thick, the axle-boxes become hot; if too thin, it is used up too quickly. Again, if there is too much alkali, there is a residue left in the boxes; if too little, the grease is too soft and wasteful. The grease is always yellow; but it is made of a thinner consistency for cold weather than for hot. The following are given as the constituents of two kinds that meet with approval, to produce one ton of each kind of grease, allowing a certain percentage for waste:

	WINTER.			SUMMER.		
	cwts.	qrs.	lbs.	cwts.	qrs.	lbs.
Tallow	3	3	0	4	2	0
Palm-oil	2	2	0	2	2	0
Sperm-oil	0	1	7	0	0	27
Alkali	1	0	14	1	0	8
Water	12	3	13	12	0	26

The manufacture is very simple. The tallow and oils are heated to 180° F.; the water and alkali to 200°; both are run off into wooden tubs, where they are well stirred till cold, with special precautions against the admission of any grit or dirt.

Wagon grease is coarser and cheaper in quality. The ingredients are chiefly some kind of resinous oil and caustic lime. When resin was cheap, wagon grease cost about half the price of locomotive grease, and was useful not only for wagon and carriage axles, but also for low-speed goods and mineral locomotives; but during the American war, the price of resin rose and then attempts were made to use residues from paraffin, coal-tar, candle-making, cotton-seed oil, fish-oil, pitch-oil, and other substitutes.

It is said that 3000 tons of grease are made every year in the Tyne district, not exactly as a primary product, but as using up a residue from the distillation of resin.

GREAT BASIN, or Fremont's Basin, a remarkable tract of country in North America, lying in the west of Utah Territory, and bounded on the w. by the Sierra de Nevada, and on the e. by the Wahsatch Mountains. It is said to be 500 miles in extent from east to west, and about 350 from north to south; is girdled round on every side by high mountains, while detached groups cross its whole area; and lies at an elevation of about 5000 feet above sea-level. The Humboldt River Mountains, with an elevation of from 5000 to 7000 feet above the surrounding country, traverse the plateau near its centre. This basin contains many lakes and rivers whose waters never reach the ocean, but are either taken up by evaporation, or are lost in the more arid districts. The G. B. is essentially a desert. Some portions of it are covered by a yielding mass composed of sand, salt, and clay; others by a crust of alkaline and saline substance.

GREAT BEAR LAKE. See BEAR LAKE, GREAT.

GREAT BRITAIN. Under this head are noticed—1. The Island of Great Britain—its geology and geography; 2. The United Kingdom of Great Britain and

Digitized by Google

Ireland—its general statistics, &c. Historical sketches of England and Scotland down to the union of the two kingdoms are given under their respective names; the history of Ireland to its union with Great Britain is also given under its own name, together with its geography.

The ISLAND OF GREAT BRITAIN—so called to distinguish it from Britannia Minor, or Little Britain (see BRETAGNE) in France—lies between lat. 49° 57′ 30″ and 58° 40′ 24″ n., and between long. 1° 46′ e. and 6° 13′ w., and is the largest island in Europe. It is bounded on the n. by the Atlantic, on the e. by the North Sea, on the s. by the English Channel, and on the w. by the Atlantic, the Irish Sea, and St George's Channel. The most northerly point is Dunnet Head, in Caithness; the most southerly, Lizard Point, in Cornwall; the most easterly, Lowestoft Ness, in Suffolk; and the most westerly, Ardnamurchan Point, in Argyleshire. Its greatest length is about 608 miles, and its greatest breadth (from Land's End to the east coast of Kent) about 320 miles; while its surface contains about 89,600 square miles.

Geology.—The geology of G. B. is of peculiar importance. The rocks of the earth's crust having been first systematically studied and expounded here, British geologists have given to the world the names whereby the various strata are known, and British rocks form the typical series of the earth's strata. The whole recognised series of stratified deposits occur in Britain, one or two only being more fully developed elsewhere; and it is only in these singular cases that the foreign equivalents are taken as the types. British geology is no less important from the influence it has had in the development of the country. The mineral wealth, especially the coal and the iron, are the real sinews and muscles of Britain's mighty power. No other country has similar advantages in such an area.

We shall, in this sketch of the distribution of the British rocks, follow the order of the strata, beginning with the lowest and oldest. It may be said that, in general, the mountainous regions of the north and west are formed of the oldest sedimentary rocks, and that as we move south-eastwards, we gradually pass over newer strata, until, in the east of England, we come to the only extensive Pleistocene deposits in the country.

The base rocks of the whole series occur in the Outer Hebrides, in Tiree and Coll, and along the western shores of Sutherland and Ross. The true position of these strata has been only recently determined by Murchison and Geikie, who, noticing that their strike was at right angles to the beds resting above them, discovered that they were older than the superimposed Cambrian rocks. They consider them to be the equivalents of the *Laurentian system*, described by Sir W. Logan in Canada. The predominant rock is crystalline gneiss. A band of limestone occurs on the north-east shores of Loch Marce, but this has hitherto proved unfossiliferous.

Resting on the convoluted edges of this old gneiss on the mainland, and forming the basement rocks in Cumberland, Anglesey, and North Wales, we have the *Cambrian series* of deposits. In Scotland, these rocks are brownish red sandstones and conglomerates; in England and Wales, they are composed of sandstones, gritstones, and slates. A few fossils, chiefly impressions of supposed fucoid plants, annelid tracts, and zoophytes, have been found in the slates.

The *Silurian measures* occupy a large portion of the surface of the country. The typical rocks occur in Wales, extending over the western portion of the principality from Pembroke to Denbigh, and including the northern portions of Pembroke, Caermarthen, and Brecknock, the whole of Radnor and Montgomery, the south-west of Denbigh, and the whole of the counties to the west. The oldest or Lower Silurian beds are next the coast. The series consists of an immense thickness of shales, slates, and sandstones, with intercalated limestones more or less pure. Immense tracts have hitherto proved devoid of fossils; in other districts, the calcareous rocks are almost entirely composed of the remains of marine invertebrate animals, while the shales abound in zoophytes and crustacea. The high lands in the north of Lancashire and south of Westmoreland are Silurian; but it is in Scotland where these strata are most extensively developed; indeed, almost the whole country consists of Silurian strata, with the exception of a large trough in the centre, occupied with newer rocks. A line drawn from Dunbar to Girvan forms the northern limit of these beds in the south of Scotland. Except the lower half of the valley of

Digitized by Google

the Tweed, the whole region from this line to near the base of the Cheviots is Silurian. The rocks are chiefly greywacke, with scattered beds of impure limestone. The chief fossils are graptolites, crustacea, and mollusca. The lead-mines of Wanlockhead and Leadhills are in this district. A line drawn from Stonehaven to Helensburgh would mark the termination of the Silurian strata, which compose the whole of the north of Scotland, with the exception of the newer beds on the north-east coast, and Laurentian and Cambrian series already described. All the series is greatly metamorphosed; the lower strata are converted into quartzose flagstones and quartz rock, the upper into chlorite and mica-slate, and quartzose and gneissose rocks.

The *Old Red Sandstone strata*, consisting of conglomerates, coarse and fine grained sandstones, and dark-colored schists with the characteristic fossils of ganoid and placoid fish, overlie the Silurians in several districts in Scotland. Nearly all Caithness and the seaward portions of Sutherland, Ross, Cromarty, Inverness, Nairn, and Moray, belong to these strata. A broad band, rising on the east coast between Stonehaven and St Andrews, stretches across the country to Helensburgh and Dumbarton on the west. The same strata appear again in Haddington, Berwick, and Roxburgh, in Lanark, and in Ayrshire. An extensive tract of these strata occurs in South Wales and the neighboring English counties, extending from the Silurian district to the Severn and the Bristol Channel, and containing in a large basin the South Wales coal-field. The highly fossiliferous strata of North Devon, and of South Devon and Cornwall, belong to this period. They consist of slates, sandstones, and limestones, and contain numerous corals and shell-fish.

The strata of the *Carboniferous period* may be said to occupy a broad tract extending from the Bristol channel to the base of the Cheviots. They are not continuous between these limits, but are broken up in some places by the appearance on the surface of older strata, while in others they are covered by newer deposits. The various detached coal-fields are—(1) the south Wales, in Glamorgan and Pembroke; (2) the Bristol, and (3) the Forest of Dean, in Gloucester; (4) the Forest of Wyre, in Worcester; (5) Shrewsbury, and (6) Colebrook Dale, in Shropshire; (7) North and (8) South Staffordshire; (9) Warwickshire; (10) Leicestershire; (11) Flint and Denbigh; (12) Lancashire; (13) York and Derby; (14) Cumberland; and (15) Northumberland and Durham. In the northern portion of this great tract of coal measures, where the millstone grit and carboniferous limestone are largely developed, no seams of coal of any value are contained. The limestone in Derby is rich in metallic ores. The carboniferous strata of the north of England extend beyond the Cheviots into Scotland, forming a narrow band from the Solway to the North Sea, in the counties of Dumfries, Roxburgh, and Berwick. The only coal-field in this district is one of small extent at Canonbie, in Dumfriesshire. The carboniferous strata in Scotland, with the exception just stated, are confined to the immense trough between the Silurian measures on the south and the Old Red Sandstone on the north, which is completely occupied by them, except where the Old Red Sandstone rises to the surface. Considerable tracts of sandstone and limestone without coal break up the true coal-bearing measures into the following coal-fields: the Mid-Lothian, the Fife, the Lanark and Stirling, and the Old Cumnock, in Ayrshire. Besides coal, the whole of the carboniferous series contain immense stores of argillaceous carbonate of iron, the ore from which is produced the great bulk of the iron used in the country. The sandstones of this period form beautiful and durable building-stones, the limestones are of great commercial value, and many of the less indurated shales are good fireclays.

Permian strata, consisting of magnesian limestone and sandstone colored with oxide of iron, occupy a considerable area in Durham, and border the carboniferous rocks in Dumfries, Cumberland, Westmoreland, Lancashire, Cheshire, Shropshire, Stafford, Worcester, Warwick, Nottingham, and York, and in Glamorgan. The sandstone is quarried for building.

The typical triple series of the *Triassic measures* occur in Germany; the British representatives consist of variously colored sandstones and marls. They occupy a considerable surface in Lancashire, Cheshire, Shropshire, and Stafford, and extend as a ribbon of varying breadth, from the mouth of the Exe, through Devon, Somerset, Gloucester, Worcester, Warwick, Leicester, Nottingham, York, and Durham,

Digitized by Google

to the coast at Hartlepool. The only deposits of rock-salt in Britain occur in the Triassic rocks of Cheshire and Worcestershire.

The *Lias* consists of white sandstones, limestones, shales, marls, and alum slates. They abound in fossils, especially in the remains of reptiles, fishes, mollusca, and encrinites. The strata of this age occupy a band between the Trias and the Oolite, extending from Lyme Regis to the mouth of the Tees. Two small tracts of Lias occur, the one in Glamorgan, and the other in Shropshire. In Scotland, small patches exist at Brora in Sutherland, and in the islands of Skye, Eigg, and Mull.

The *Oolite measures* are composed of an extensive series of limestones, sandstones, and shales, which occupy a belt of nearly 30 miles broad, from Yorkshire to Dorsetshire, passing through Lincoln, Northampton, Huntingdon, Bedford, Buckingham, Oxford, and Wilts. The best building materials in England are obtained from these strata. Oolite strata occur in Scotland at Brora and in Skye. In the Brora Oolite, a seam of coal 3½ feet in thickness has been worked for upwards of a century. It is the thickest bed of pure vegetable matter detected in any Secondary formation in Britain.

The fresh-water *Wealden series*, with their abundant remains of reptiles, fishes, shells, and insects, occur in Kent and Sussex, in the Isle of Wight, and in the south of Devon.

The beds of the *Cretaceous period*, consisting chiefly of chalk with intercalated sands and clays, all very rich in fossil remains, occupy a broad tract to the east of the Oolite strata, and parallel to them. Beginning a little north of Flamborough Head, they may be traced through York and Lincoln, then across the Wash into Norfolk, Suffolk, Hertford, Buckingham, Oxford, Berks, to Hampshire, where they separate into three arms, the one extending south-westward through Wilts and Dorset to the south coast; another taking a south-east direction to Beachy Head; and the third stretches as a narrow band in an easterly direction through Surrey and North Kent, widening out as it nears the coast, where it occupies the district between Ramsgate and Folkstone;

Eocene strata, consisting of clays, sands, and marls, abounding in fossils which apparently indicate a sub-tropical climate, occupy the valley of the Thames, from Hungerford to the sea, and from Canterbury to Saxmundham, as well as a large district in Dorset, Hants, and Sussex, from Salisbury west to Dorchester, and east almost to Hastings.

Unless the beds in Mull, containing the numerous impressions of leaves of exogenous plants, are *Miocene strata*, there are no representatives of this period in Britain.

The *Pliocene deposits* of ferruginous shelly sand and marl known as red crag occur chiefly in Suffolk. The still more recent *Pleistocene deposits* of fresh-water sand and gravel, and mammaliferous crag, are found on the coasts of Norfolk, Suffolk, Essex, and Kent. The till and glacial beds of the same age are scattered as superficial deposits over large districts in Britain. Fossiliferous beds of this age occur in Caithness, in the valley of the Clyde, and in Lancashire; they contain remains of mollusca, many of which still live in the seas of boreal America.

Minerals—Coal.—From the collieries in Britain in 1876 were raised 133,344,766 tons of coal. The greatly increasing consumption of coal has originated fears as to the possibility of the exhaustion of our mineral fuel. It appears that, while in 1820, only 15,000,000 tons were raised, in 1840, the amount had reached 30,000,000, and in 1860, it was nearly 84,000,000. At the same rate of increase, the known coal, within a workable distance from the surface, would last at least 100 years. But the consumption, during the last 20 years of the century, would, at the present increasing ratio, amount to 1464 million tons a year, a quantity vastly greater than can possibly be used. We need not, therefore, now begin to fear lest our coal-fields should be speedily used up.

Iron.—Formerly, the only iron produced in the country was obtained from the greensand of the south-east of England, and from the brown hæmatite of the Dean Forest. The ore was smelted with charcoal. But the introduction of coke and coal for smelting, and the discovery of numerous additional and unthought-of deposits, especially in connection with coal-bearing strata, has immensely increased the production of iron, and met the greatly increased demands for this important metal.

Digitized by Google

In 1760, when charcoal alone was used for smelting, not more than 25,000 tons of iron were produced; while in 1860, no less than 3,826,752 tons were obtained from 8,024,206 tons of ore. The market value of the metal was £12,703,950. In 1876, the total iron ore production of the United Kingdom, of which returns were received, amounted to 16,841,583 tons, of the value of £6,825,705. The most important ore is the ferruginous shale, or impure argillaceous carbonate of iron, which occurs in connection with every coal-field in Britain. The brown and red hæmatite, associated with the oldest Palæozoic rocks, yield also a large amount of metallic iron.

Tin is obtained from only two counties—Cornwall and Devon. In 1876 the produce was 8500 tons of metallic tin, worth £675,750.

Copper is principally obtained from the same two counties. There are about 101 different mines, which produced, in 1876, 79,252 tons of ore, yielding 4694 tons of metallic copper, worth £892,300. In 1860 there was a yield of 13,789 tons of ore, producing 985 tons of metal, worth £100,691, chiefly from the counties of Lancaster, Caermarthen, and Anglesey, very small quantities being supplied from Cumberland, Chester, Cardigan, and the Isle of Man.

Lead and *Silver* are obtained from the same ore from numerous mines in Palæozoic districts. The most productive English mines are in Northumberland, Durham, Cumberland, York and Derby, in Shropshire, and in Cornwall and Devon. Small quantities are obtained in Somerset, Westmoreland, Stafford and Chester. All the Silurian counties of Wales contain mines. The Isle of Man yields nearly 3000 tons of ore. In Scotland, the most productive mines are at Wanlockhead and Leadhills; Argyll, Perth, and Kirkcudbright also supply small quantities. The total amount of ore raised in 1876 was 79,096 tons, yielding 58,667 tons of metal, worth £1,270,415. From this there were separated 483,422 ounces of silver, worth £106,292.

Zinc is obtained from Cornwall and Devon, Cardigan and North Wales, Derby, Cumberland, and the Isle of Man. The produce in 1876 was 23,618 tons of ore, valued at £90,142. The metallic zinc obtained from this amounted to about 6641 tons, valued at £158,011.

Sulphur Ores (iron pyrites) were raised in different parts of G. B.; chiefly in Cornwall, to the extent, in 1876, of 43,309 tons, worth £13,870.

The following minerals are also raised in Cornwall, viz., arsenic, manganese, gossan, nickel, silver-copper, fluor-spar, and wolfram.

Salt occurs in Cheshire, Worcestershire, Staffordshire, and Ireland: produce (1876) 2,278,256 tons, valued at £1,136,628.

The mineral produce of G. B. amounted in 1876 to £58,691,832.

Physical Geography. The physical features of a country are intimately connected with its geological structure. The older Palæozoic rocks produce mountainous regions, intersected with deep and narrow valleys. The newer strata seldom rise to a great height. Their high lands are rounded undulations of the strata, except where igneous rocks are intruded, and the valleys are broad and shallow. In Scotland, we have, consequently, two extensive mountainous districts, occupied chiefly with rocks of Silurian age, and an intervening valley filled up with Old Red Sandstone and Carboniferous measures. The northern mountain region is intersected by the Great Glen, which is a fissured anticlinal axis in the Silurian strata. It is difficult to group the mountains in this district. The Grampians from Aberdeen to Argyle shew the most marked linear arrangement; the greatest eminence in this range is Ben Lawers (3945 feet). Between the Grampians and the Great Glen a succession of great eminences occur, the highest of which, and the culminating point of the whole British Isles, is Ben Nevis (4406 feet). To the north of the valley of the Caledonian Canal, the region is a confused mass of mountains, reaching in Ben Attow a height of 4000 feet. Caithness consist of plains of undulating sandstone, covered with drift; the headlands and sea-cliffs in this county are bold and striking. The coast-line of the Palæozoic region of the north of Scotland is repeatedly broken by numerous and large friths or sea-lochs, and the interior abounds in picturesque lakes. The Silurians of the south of Scotland form an extensive mountain range crossing the island from St Abb's Head to Stranraer. The rocks are less indurated than in the north, and the scenery is consequently not so wild. The mountains have generally broad flattened forms, intersected by deep pastoral glens, which widen out into broader valleys and dales. The principal heights are Hartfell (2790 feet) and

Digitized by Google

Black Larg (2890 feet). The great central valley of Scotland embraces the basins of the Clyde, Forth, and Tay. It contains several tracts of rich table-land, and is frequently broken through by igneous rocks, chiefly trappean, which project into bold and picturesque hills.

England and Wales, in the Cambrian and Silurian districts, have the same mountainous character as similar districts in Scotland; but as so much of England is occupied with newer strata, it may be considered on the whole as a level country, traversed by ridges of varying elevation, which form the water-sheds of the country. The range, beginning with the Cheviot Hills, is continued from the borders of Scotland southwards, as the Pennine range, through Northumberland, Cumberland, Westmoreland, Lancashire, and Yorkshire, to the middle of Derbyshire; it varies in height from 1200 to 3000 feet, reaching its highest summit in Crossfell, Cumberland, which is 2393 feet high. The band of Lias and Oolite, extending from Yorkshire to Dorset, forms a tortuous range of table-land, rising sometimes into hills to the height of 1500 feet, and throughout its course presenting generally a bold escarpment to the west, and having a gentle slope to the east. To the west of this range of table-land are the valleys of the Yorkshire Ouse, the Trent, and the Severn; on the east, the Great Ouse and the upper portion of the Thames. Beyond these two rivers, the country rises into a range of low chalk-hills, which follow the cretaceous strata from Norfolk to Wiltz, dividing with the strata into three ranges, two of which take an easterly direction through Sussex and Surrey and Kent, bordering the Wealden strata, and forming the South and North Downs. Devon and Cornwall are mountainous, from the intrusion of granite and other igneous rocks through the Paleozoic strata.

The details of the physical geography are given under the names of the several countries, lakes, rivers, &c.

Climate.—The climate of G. B. derives its peculiar character from the insular situation of the country, taken in connection with the prevailing direction of the winds. It is mild and equable in a remarkable degree, the winters being considerably warmer, and the summers colder than at places within the same parallels of latitude. For at least three months, the mean monthly temperature ranges between 50°·0 and 60°·0; for other three months it continues about 60°·0, or occasionally a little higher, seldom more than three degrees; and for the remaining six months it ordinarily ranges between 36°·0 and 48°·0. Since the Reports of the Registrar-general clearly prove that the temperature most conducive to health is between 50°·0 and 60°·0, it follows that, as far as concerns temperature, the climate of G. B. is one of the healthiest in the world.

As appears from data furnished by the Reports of the English and Scottish Meteorological Societies, the mean temperature of England is 49°·5, and of Scotland 47°·5. The mean temperatures of the following places, arranged according to the latitude, have been deduced from the same sources: Guernsey, 50°·2; Truro, 51°·3; Ventnor, 51°·5; Barnstaple, 50°·8; Aldershott, 49°·4; Greenwich, 49°·5; Bedford, 49°·3; Derby, 48°·8; Liverpool, 48°·9; Manchester, 48°·0; Isle of Man, 47°·8; Scarborough, 47°·0; Milne-Graden (Berwick), 46°·8; Dalkeith, 46°·9; Rothesay, 47°·8; Greenock, 47°·9; Arbroath, 46°·6; Culloden, 46°·8; Tongue, 46°·5; Sandwick (Orkney), 45°·6; and Bressay (Shetland), 45°·3. There is thus a difference of fully six degrees between Ventnor, in the Isle of Wight, and Shetland. As this difference is chiefly attributable to the difference of their latitudes, it follows, that it will become greater as the force of the sun's rays increases; and hence, while the winter temperatures are respectively 42°·2 and 39°·5, the summer temperatures are 61°·8 and 58°·4. A pretty regular decrease of temperature, with an increase of latitude, will be observed, particularly if the places on the west side of the island be regarded as a distinct series by themselves. It will appear, on examination, that the temperatures of places on the west are about a degree in excess of those of places in the same latitudes, but at some distance from the Atlantic. In the winter, the differences between the west and the other parts of the country are still greater. Thus, whilst the winter temperature of Truro is 45° 0; Guernsey, 43°·8; Ventnor and Barnstaple, 42°·2; Isle of Man, 41°·8; Liverpool, 40°·6; and Greenock, and the whole of the west coast of Scotland, as far as Shetland, 39°·5—that of Greenwich is 37°·9; Nottingham, 37°·3; York, 37°·1; Scarborough, 38·8; Dalkeith, 37°·0; Arbroath, 37°·1; and Culloden, 38°·2.

Digitized by Google

The south-west winds are the most prevalent throughout the year, except in April and May, when they give place to the north-east winds. The notoriously dry and parching character of the latter render them very deleterious to health. On the other hand, the south-west winds, coming from the Atlantic, are moist and genial, and it is on their greater frequency—being, as compared with the north-east, in the proportion of two to one—that the salubrity of the climate in a great measure depends.

In those districts of England where hills do not interfere, the annual rainfall is about 25 inches, and in similar parts of Scotland about 28 inches; but these amounts, which may be considered as the minimum falls, are variously increased by proximity to hills, according as the place is situated in the east or west of the island, viewed in relation to the direction of the wind which brings the rain, and by its lying to the wind or lee side of these hills. Since it is the south-west winds which bring the rain, the heaviest falls take place among the hills in the west of the country; and it may be here observed that, in the west, where there are no hills lying to the north-west, west, or south-west, the annual rainfall is about the minimum. The annual rainfall in Cornwall, Wales, Cumberland, and the West Highlands, may be estimated at from 45 to 65 inches. In some places, however, this amount is far exceeded. At Seathwaite, in Cumberland, for instance, the rainfall is truly tropical, the mean annual amount being 127 inches; in 1861, it was 183 inches; and in the month of November of that year the enormous quality of 35·41 inches fell at this station. At Tyndrum, in Perthshire, 134·5 inches fell in 1861; and at this place, and among the Arrochar Hills, the monthly rainfall is occasionally between 20 and 30 inches.

Natural History.—The natural history of G. B. corresponds generally with that of continental Europe (q.v.). Very few species, either of plants or animals, are peculiar to Great Britain. The flora of the greater part of the island most nearly resembles that of Germany; but in the south of England there is, as might be expected, a closer correspondence with that of the north-west of France; and some plants found in the Channel Islands and on the French coast appear nowhere in Britain but in the south-west of England. The mountains of Wales, Cumberland, and Scotland have a vegetation resembling that of Scandinavia more than that of the mountains of Central or Southern Europe. The state of the case is much the same as to the fauna. There are, however, many remarkable instances both of plants and animals, which, from these apparent relations to continental Europe, might be expected in G. B., and which are not indigenous to it. As examples, may be mentioned, among plants, the Norway spruce, and among animals, the lemming, both common in Scandinavia. The progress of civilisation and of cultivation has completely banished from G. B. many of the animals which were once numerous, as bears, wolves, &c. But on the contrary, many plants which were unquestionably introduced by man, have become thoroughly naturalised.

Ethnology.—The present population of the island of G. B. is the result of successive waves of immigration and conquest. When the Romans invaded Britain (54 B.C.), the inhabitants were Celtic; and they continued to be essentially so until the 5th and 6th centuries, when—the Romans having previously retired—the level parts of the country were gradually overrun and subdued by German tribes from the opposite coasts. Then followed invasions of Danes and other Scandinavian nations, and lastly the Norman Conquest. As the Normans, however, were originally from Scandinavia, they cannot be considered as adding any new ethnological element; so that the inhabitants of England (excepting Wales) and of the Lowlands of Scotland may be considered as sprung from an amalgamation of the original Celtic with German and Scandinavian blood, the latter having predominated so as to determine the language, institutions, and character of the resulting race. Wales and the Highlands of Scotland are still inhabited by representatives of the ancient Celtic tribes. See WELSH LANGUAGE AND LITERATURE; SCOTLAND; PICTS; IRELAND; CELTIC NATIONS; BRITANNIA; and ANGLO-SAXONS.

Notwithstanding the union of the two kingdoms into which the island was once divided, the distinction, for certain purposes, is still kept up. England (including Wales), the larger and southern division, extends as far north as the parallel of 55° 48′, the boundary-line running between Berwick-on-Tweed and the Solway Firth (see BORDER, THE); its greatest length is about 400, and its greatest breadth about

Digitized by Google

320 miles. Area, about 58,300 square miles. England resembles to some extent a triangle in shape, its southern shore forming the broad base, and its east and west coasts gradually approaching until the apex is reached at Berwick-on-Tweed. Scotland occupies the northern part of the island; its greatest length (from the Mull of Galloway to Dunnet Head) is about 287 miles; its greatest breadth (from Peterhead to Ardnamurchan Point) about 182 miles; elsewhere, however, the breadth is much less. Between Alloa, on the Forth, and Dumbarton, on the Clyde, it is only 33 miles; between the head of Loch Broom, on the west coast, and of Dornoch Firth, on the east, only 26 miles; and north of Inverness, the average breadth does not exceed 70 miles. The entire area is about 31,300 square miles. The greater part of the surface of Scotland is irregularly distributed into mountain and valley, a very small proportion spreading into level plains. The eastern coast forms a waving, continuous, and rarely broken line; but the western is extremely irregular, being deeply indented with bays and arms of the sea, and exhibiting steep promontories and mountainous islands. The whole country is physically divided into *Highlands and Lowlands*—the former comprehending the north-west, west, and central portions; the latter, generally speaking, the east coast, and the country south of the Forth and Clyde.

Islands.—The island of G. B. is surrounded by the Isle of Man, Anglesey, the Scilly Isles, the Isle of Wight, the outlying Channel Islands, the Shetland Isles, the Orkneys, and the Hebrides, each having generally a mainland encircled by small islands and rocks, bare or scantily covered, which sea-fowls inhabit, fishermen in their boats visit, and shepherds sometimes dwell in during summer. The coast against the North Sea has few islands, except Thanet, Sheppey, and some lowlands, which are isolated at high water. Coquet, Staples, Holy Island, May Island, Inchkeith, and Inchcolm, are the only ones inhabited. The Orkneys and the Shetlands lie to the north. St Michael, Looe, and the Isle of Wight, are the only islands on the south coast, except those sometimes connected with the land, and the Channel Islands off the coast of Normandy. All the other islands lie on the west coast, extending from the Scilly Isles, through Anglesey and Man, to the Island of Lewis. According to the census of 1851, there were about 500 of these islands and rocks, of which only 175 were inhabited; but in 1861 a more careful enumeration was made when it was ascertained that Scotland alone had 787, of which 186 were inhabited. The number belonging to England was not stated.

For administrative purposes, G. B., with its surrounding islands (excepting the Channel Islands and the Isle of Man, which are under peculiar jurisdiction), is divided into 84 counties or shires. The following tables exhibit their several areas and populations:

ENGLAND.

Counties.	Area in Stat. Acres.	Inhabited Houses, 1871.	Population. 1871.	Population. 1861.
Bedford	295,582	30,508	146,256	135,265
Berks	451,210	39,612	196,445	176,103
Buckingham	466,932	37,162	175,870	166,597
Cambridge	525,182	40,091	186,363	175,950
Chester	707,078	110,743	561,131	505,153
Cornwall	873,600	73,956	362,098	369,328
Cumberland	1,001,273	44,069	220,245	205,293
Derby	658,903	78,530	330,538	339,377
Devon	1,657,180	105,175	600,814	584,531
Dorset	632,025	39,404	195,544	188,651
Durham	622,476	114,658	685,045	509,018
Essex	1,060,549	92,359	466,427	404,614

Cyprus (q. v.) though now occupied and administered by G. B., is of course not properly a "possession."

The United Kingdom of Great Britain and Ireland is, since the Union of Ireland, the full official designation of the country more generally known as Great Britain, Britain, or the United Kingdom. In addition to the home territories, G. B. possesses a multitude of dependencies scattered over every part of the globe, and constituting "an empire on which the sun never sets."

Most of the subjects which enter into a complete account of G. B. are treated under separate heads. The following are brief indications of a general kind:

Agriculture.—The soil of G. B. is almost exclusively devoted to the production of the two necessaries—bread-stuffs and grass (roots &c., for domestic animals). For this purpose both the soil and the climate are admirably suited. M'Culloch estimated the number of acres in England under grain crops in 1852—1853 at 6¼ millions (wheat, 3 millions; barley, 1; oats and rye, 2; beans and peas, ¼), and the total produce at 27½ million quarters—value £37,000,000. The produce of potatoes, turnips, rape, and clover is estimated at £26,000,000. The annual value of the pastures and meadow-hay is immense. In 1857, according to the careful statistics collected by the Highland and Agricultural Society of Scotland, there were in Scotland 3,556,572 acres under rotation, the chief crops being grass and hay, 1,459,805 acres; oats, 933,613 acres, yielding 32,750,768 bushels; wheat 223,152, yielding 6,154,986 bushels; barley, 198,337, yielding 6,564,429 bushels; turnips, 476,691 acres, yielding 6,690,109 tons; potatoes, 139,819 acres yielding 480,468 tons. The live stock amounted to 6,989,368—viz., 185,409 horses, 974,437 cattle, 5,683,168 sheep, and 146,354 swine. The total extent of land returned in 1874 as being under all kinds of crops, bare fallow and grass, was 31,266,919 acres in Great Britain, 15,752,187 acres in Ireland, 94,100 acres in the Isle of Man, 18,436 (1873) acres in the island of Jersey, and 11,678 acres in the islands of Guernsey, Alderney, &c., making a total for the United Kingdom of 47,143,320 acres. The total acreage of land returned as under cultivation in Great Britain has been larger in each year since the returns were first collected from all occupiers of land in 1868. The live-stock in the United Kingdom in 1874 was as follows: The number of horses included in the agricultural returns was 1,847,148; in Great Britain, only horses used for agriculture, unbroken horses, and mares kept solely for breeding, are included in the returns; by adding 915,000 for the estimated number of all descriptions of horses, we find the total number of horses in the United Kingdom to be 2,860,000. The total number of cattle returned for the United Kingdom in 1874 was 10,281,036; of sheep the total number was 34,837,597; and of pigs, 3,557,354. Of these numbers of live-stock, Great Britain (exclusive of the islands) possessed 2,225,000 horses, and Ireland 525,770; giving a proportionate number per 100 acres of land under cultivation, of 7·1 in Great Britain, and 3·4 in Ireland. Of cattle of all kinds there were 6,125,491 in Great Britain, or 19·6 per 100 acres; and 4,118,118, or 26·1 per hundred acres, in Ireland. Sheep numbered 30,313,941, or 97·0 per 100 acres, in Great Britain. In 1878, there were 47,327,000 acres under cultivation in the United Kingdom. In the same year there were for every 100 acres, 4·0 horses, 20·6 cattle, 68·2 sheep, and 8·4 pigs.

Total	423.400	596,082	682,497	722.405	930.235

The jute trade is rapidly rising into importance, especially in Scotland. In 1861 there were 36; in 1868, 41; and in 1875, 110 jute factories in the United Kingdom; and the total number of persons, male and female, employed in this manufacture in 1875 was 37.920.

For other great branches of industry, See IRON, PAPER, POTTERY, &c.

Imports and Exports.—The following table exhibits the value of the imports and exports for the years 1857, 1858, 1861, and 1875:

	1857.	1858.	1861.	1875.
Imports	£187,844,441	£164,583,832	£217,351,881	£373,941,125
EXPORTS:—				
British Produce	122,066,107	116,608,756	125,115,133	223,494,570
For'n & Colonial Produce	24,108,194	23,174,023	35,694,297	45,402,198
Total Exports	£146,174,301	£139,782,779	£160,809,430	£268,896,768
Total Imports & Exports	£334,018,742	£304,368,611	£378.161.311	£642.837,893

The chief imports are raw cotton, corn and flour, sugar, wool, silk manufactures, and tea; the chief exports are cotton manufactures, woollen and worsted manufactures, iron and steel, linen manufactures, coals and culm, and machinery.

Gold and Silver Bullion and Specie.—The computed real value of the gold and silver bullion and specie brought into the United Kingdom in 1858 was £29,493,190; in 1859, £37,070,156; in 1860, £22,978,196; and in 1861, £18,747,045. Of this quantity Australia sent by far the most—viz., in 1858, £9,066,289; 1859, £8,637,854; 1860, £3,-719,857; and 1861, £6,331,828. Mexico, South America and the West Indies, were the next largest exporters, then the United States and France. The exports from the United Kingdom during the same period were—1858, £19,628,876; 1859, £25,688,-803; 1860, £25,534,768; 1861, £20,811,648. The declared real value of gold and silver bullion and specie imported into the United Kingdom during the year 1871 was—gold, £21,613,005; silver, £16.527,322; total, £38,140.327; exported—gold, £20,698,275; silver, £18,062,396; total, £38,760,671. The declared real value of such bullion and specie imported during the year 1875 was as follows—gold, £23,100,834; silver, £10,-123,955; total, £33,224,789; exported—gold, £18,810,426; silver, £8,906,726; total, £27,717,152.

Shipping.—G. B. had, in 1861 (exclusive of river-steamers), 19,288 registered sailing-vessels, with an aggregate burden of 3,918,511 tons, and 997 steamers, carrying 441,184 tons, making together 20,285 vessels, of 4,359.695 tons burden, and employing, exclusive of masters, 171,957 seamen. During the same year, there were built and registered in the United Kingdom 1186 vessels, 215 of them steam, of an aggregate burden of 310,900 tons. The total tonnage of vessels entering and clearing British ports in 1861 was 26,595,641 tons, 21,924,983 tons representing cargoes, the rest being in ballast. The coast trade of G. B, during the same year amounted

Digitized by Google

to 17,355,235 tons, all but 98,000 tons being carried by British ships. In 1871, the number of registered sailing-vessels engaged in the home trade was 11,888, employing 41,828 men, and their tonnage was 777,185. The number of steam-vessels, exclusive of river steamers, in the same trade was 1191; men, 12,613; tons, 195,125. The number of sailing-vessels engaged in foreign trade was, in the same year, 800, with 5767 men, and an aggregate of 157,964 tons; and of steam-vessels, 1066, with 40,323 men, and an aggregate of 936,914 tons. In 1875, there were in the United Kingdom 20,644 sailing-vessels and 4160 steamers registered under the Merchant Shipping Act. The estimated number of seamen was 257,336, an increase of more than 50,000 since 1870. In 1877 there were 20,538 sailing-vessels and 4552 steamers, with 264,876 seamen.

Railways.—The total length of lines open for traffic in the United Kingdom in 1870 was 10,433 miles. During the year, 163,455,678 passengers travelled, of whom 20,625,851 were first class, 49,041,814 second class, and 93,763,013 third class. The amount of money derived from these travellers was—first class, £3,170,935; second class, £3,944,713; third class, £4,162,487. Luggage, mails, &c., brought up the receipts from passenger-traffic to £13,085,756. The goods-traffic in the same year amounted to £14,680,866, making a total income of £27,766,622. The total amount invested in railways by shares and loans in 1858 was £325,375,507, on which was paid interest to the total amount of £6,653,166. The average rate of dividend on the ordinary share capital over the whole kingdom in 1858 was 3.06 per cent.; the proportion per cent. of expenditure to total receipts in 1860 was 47. In 1860, the rolling stock of the various companies consisted of 5801 locomotives, 15,076 carriages of all kinds, and 180,574 wagons. At the end of 1874 there were 16,448 miles of railway open for traffic—showing an addition since 1860 of 6015 miles. Of this entire length 11,622 miles belonged to England and Wales; to Scotland, 2609; and to Ireland, 2127. To the total capital paid up, England and Wales contributed £508,720,097; Scotland, £71,827,140; and Ireland, £29,902,682. At the end of 1877 there were 12,098 miles of railway open in England and Wales; 2776 in Scotland; in Ireland, 2203—in all, 17,077 miles.

Revenue and Expenditure.—The following table shews the total amounts of the actual revenue and expenditure for the seventeen years from 1860 to 1875, along with the proportion of receipts and of expenditure for each person in the United Kingdom:

	Revenue.		Expenditure.	
	Receipts at the Exchequer.	Proportion per head of Population.	Payments out of the Exchequer.	Proportion per head of Population.
		£ s. d.		£ s. d.
1860,	£71,089,669	2 9 10	£69,502,289	2 8 8
1861,	70,283,674	2 8 11	72,792,059	2 10 8
1862,	69,674,479	2 8 3	71,116,485	2 9 11

The income of the United Kingdom is derived from the various sources of customs, excise, stamps, taxes, property and income tax, post-office, &c. The following are the sums received by the Exchequer from these sources during the financial year 1876-77: Customs, £20,410,420; excise, stamps, taxes and income-tax, £47,794,840 (of which the net receipts from customs were £19,922,000; from excise, £27,736,000; from stamps, £10,890,000; from land-tax, £2,532,000; from income-tax, £5,280,000); post-office, £7,314,750; telegraph service, 1,305,000; crown-lands, £539,411; miscellaneous, £4,572,321. Total £81,945,535. The following are the principal items of expenditure in the same year: Interest and management of debt, £27,992,813; army, £16,814,716; navy, £11,364,383; miscellaneous civil services, £13,333,851; charges for collecting customs and inland revenue, £2,766,279; post-office, £3,159,218; telegraph service, £1,141,000.

National Debt.—At the end of the financial year 1877, the national debt of Great Britain and Ireland amounted to £775,873,713, of which £712,621,355 was funded, and £13,943,800 was unfunded. See DEBT, NATIONAL.

Army and Navy.—See BRITISH ARMY; and NAVY, BRITISH.

Form of Government.—The government of G. B. is of the kind known as a "Constitutional Monarchy," in which the sovereign accepts of his dignity under an express agreement to abide by certain prescribed conditions. See CORONATION OATH. The sovereignty is hereditary in the family of Brunswick, now on the throne, and in the person of either a male or a female. The sovereign (king or queen) is the directing power in the executive of government; while the legislative function is exercised by parliament. Further information regarding the British Constitution and Laws will be found under the heads PARLIAMENT; MINISTRY; COMMON LAW, COURTS OF; JUDGES, &c.

Money, Weights, and Measures. See POUND; MINT; WEIGHTS AND MEASURES.

Religion.—The United Kingdom is a Protestant state, but all religions—not offensive to public or private morals—may be professed, and their different forms of worship practised, without interference from any quarter whatever. There are two churches "established" by special acts of the legislature. In England the established church is Episcopal in its government. In Scotland, on the other hand, the

Education.—In England, the chief institutions for education are the ancient, national universities of Oxford and Cambridge; the more recent institutions of London, Durham, and Lampeter in Wales; the classical schools of Eton, Westminster, Winchester, Harrow, Charter-house, and Rugby; Owens College, Manchester, and other colleges and schools chiefly for physical science; the various military schools; the colleges of the dissenting denominations; the middle-class schools, either started by individual teachers, and hence called "adventure" schools, or by associated bodies acting as directors, to whom the teachers are responsible; and the schools of design.

For primary education, a national system has now been established. Under the Elementary Education Act for England, 1870, a popularly elected school-board is established in any district where the existing schools are deficient. Schools under the act are supported by school-rates and fees, and by parliamentary grants, varying according to the number of pupils, and their proficiency as tested by different standards of examination. They are to be open at all times to government inspection. It is left to the discretion of school-boards to make education compulsory.

Scotland possesses four universities for the higher branches of education—viz., those of Edinburgh, Glasgow, St Andrews, and Aberdeen, besides a variety of minor colleges connected with Episcopalian, Free Church, and other non-established churches. The Scotch Education Act, 1872, is modelled after the English Act, but differs from it, by enacting that a school-board is to be elected in *every* parish and burgh; by making it illegal for parents to omit educating their children, between 5 and 13, in reading, writing, and arithmetic; and by comprehending higher-class

schools. The number of day-schools to which annual grants are made in England and Wales, inspected in 1874, was 12,157; the daily average attendance throughout the year was 1,678,759; 2,034,007 scholars were present at inspection; 857,611 were examined; and 508,282 passed the prescribed tests. 1432 night-schools were examined, with an average attendance of 48,690 scholars above 12 years old. In 1877, 15,187 day-schools in England and Wales were inspected, having 3,151,973 children on the roll; 1733 night-schools had 59,603 scholars. In Scotland, 2931 day-schools were inspected, with 472,668 pupils; 288 night-schools had 15,522 scholars.

History.—On the 1st of May 1707, during the reign of Queen Anne, the union of England and Scotland was formerly accomplished. (For the previous history, see ENGLAND and SCOTLAND.) In the latter of these countries, the terms at first excited the utmost dissatisfaction, and even indignation; but the progress of time has shewn it to be one of the greatest blessings that either nation could have experienced. The last years of Queen Anne's reign were marked by the triumph of the Tory party, headed by Harley and St John (Oxford and Bollingbroke), who kept up a constant intrigue with the Pretender, for the purpose of procuring his restoration. The treachery was defeated by the sudden death of her majesty in 1713. According to the Act of Settlement, she was succeeded by the Elector of Hanover, who took the title of George I. The Whigs then regained their ascendency, and, under the guidance of Walpole (q. v.), now rising to eminence, at once proceeded to impeach the more important of the Tory leaders. Other severities drove the more impatient of that party to attempt bringing in the Pretender by force of arms. In 1715, the Earl of Mar in Scotland, and the Earl of Derwentwater in England, raised the standard of rebellion; both efforts, however, proved abortive, and were speedily crushed. Five years later, occurred the frightful catastrophe known as the South Sea Bubble, when the nation was saved from anarchy mainly by the exertions of Walpole. The latter now became premier and chancellor of the exchequer, and under him the commerce and manufactures of England continued steadily to advance, though little improvement was as yet perceptible either in Scotland or Ireland. George I. died in 1727, and was succeeded by his son, George II. An attempt was again made by the Tories to oust the Whigs from power, but was frustrated by Walpole, who still continued the prime mover of public affairs. In 1739, after a peace of extraordinary duration, he was forced by popular clamor into a war with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American colonies. This war was feebly carried on, and ingloriously terminated; but the attention of England was speedily drawn towards the Austrian War of Succession, in which it was involved through the anxiety of the king for his Hanoverian possessions, and the strong antipathy of the people to the French. Walpole, disapproving of the war, was driven from office in 1742. George II. appeared on the field of battle himself, and at Dettingen proved himself a man of courage and spirit. But the success of the French at Fontenoy in 1745 paralysed the efforts of England during the rest of the campaign; and in 1748, after nine years' fighting, a peace was concluded at Aix-la-Chapelle, by which it was agreed that both nations should mutually restore their conquests, and go back to exactly the same condition as they were in before the war! Meanwhile, a second attempt had been made (1745—1746) by Prince Charles Edward Stuart to win back the throne of his ancestors. This attempt, known as the second rebellion, was crushed at Culloden (April 16, 1746), and shortly after, a variety of important measures were passed by the imperial parliament relating to Scotland generally, and to the Highlands in particular, which had the effect, on the whole, both of conciliating the inhabitants, and of increasing their civilisation. Now, after a long period of indolence and poverty, Scotland began to make advances towards that equality with England, in respect of comfort and prosperity, which it has since attained.

In 1756 broke out the "Seven Years' War," in which Britain took the side of Frederick the Great against France, Austria, Russia, and Poland. It achieved no other triumphs in Europe; on the contrary, it suffered a signal disgrace in the surrender of the Duke of Cumberland, with 40,000 men, in Hanover; but in India, Clive deprived the French of most of their possessions, while Wolfe, in the New World, conquered their colony of Canada. In the midst of this war, George II. died (1760), and was succeeded by his grandson, George III., whose reign proved to be the longest and one of the most eventful in the annals of British history. At this

Digitized by Google

time, the principal secretary of state was William Pitt, afterwards the great Earl of Chatham; but the favor which George III. shewed to the Earl of Bute, a feeble and narrow-minded Tory nobleman, rendered it necessary for the former to retire from office. Spain now joined France against Britain, as Pitt had forseen and foretold; but fortune showered her brightest smiles upon the arms of the latter, and at the peace in 1763, she was allowed to retain many of the most valuable colonial possessions of both her antagonists. These wars, however, largely increased the national debt.

George III. now shewed himself anxious to destroy the influence of the great Whig families who had brought in the dynasty to which he belonged. The nation took the alarm, and for some time was strongly disaffected towards its sovereign, who was believed to be wholly under the influence of his Scotch premier, the Earl of Bute. Popular indignation at last forced the latter to resign in 1763. His successor, Grenville, inaugurated his advancement to office by the prosecution for libel of Wilkes, the member for Aylesbury, who had made himself conspicuous by his attacks both on Bute and his royal master. The proceedings in this case lasted some years, and were attended with tumults of a serious nature, and a vehemence if not rancor of public feeling that indicated the magnitude of the discontent which prevailed. During the administration of Grenville, too, the first attempt was made to tax the American colonies by the passing of the Stamp Act in 1765. Against this the colonies protested, and the succeeding Whig ministry of Rockingham repealed it. This ministry, however, was of short duration, and was replaced by one formed by Pitt, now created Earl of Chatham. The necessity for an increase of the finances led to another attempt at American taxation, and an act for imposing duties on the imports of tea, glass, and colors was passed. This measure excited the most determined opposition among the colonists; and finally, in 1774, war broke out between them and the mother-country, which lasted eight years, and in which the former were supported by France, Spain, and Holland. It resulted in the acknowledgment of their independence, and in the formation of the republic of the United States (1783). During almost the whole of this unhappy contest, the ministry of Lord North directed the policy of the country; and it was only the success of a vote for the conclusion of the war that forced them to resign early in 1782. It was followed by the second Rockingham ministry, and that soon after by the Shelburne ministry, only remarkable for the appearance in it of the younger Pitt. The lukewarm Whiggism of Lord Shelburne gave offence to Fox and other more advanced political thinkers; the result was a coalition of the Foxites with the followers of Lord North. This coalition, factious and unprincipled in the last degree, triumphed, and under the name of the Coalition ministry, held the seals of office during the year 1783. Fox's *India Bill*, the purpose of which was virtually to transfer the government and patronage of India from the East India Company to the House of Commons, was the cause of its ruin. This bill was considered by the king to aim at fixing the ministry in power beyond the control of both himself and the people, and having induced the House of Lords to reject it, he compelled the ministry to resign. Pitt was then appointed prime minister and chancellor of the exchequer. See PITT. In 1786 commenced the trial of Warren Hastings, who was impeached by the Whig leaders Fox, Burke and Sheridan, but was ultimately acquitted. Meanwhile, the progress both of England and Scotland was unquestionable; manufactures increased, agriculture improved, and—especially in Scotland—an interest in the discussion of political and other questions of importance spread through the community, as may be seen very clearly in the poetry of Robert Burns. The French Revolution (1789) at first strengthened this interest, but the excesses of the Reign of Terror produced a decided reaction; and for many years all classes, at least all the so-called "respectable classes," were fanatically averse to the slightest innovation. In 1793 the ministry of Pitt, without any real cause, declared war against the French Republic, in spite of the opposition of Fox and Sheridan. This contest lasted till the peace of Amiens in 1801, and was on the whole very disastrous to G. B. except at sea, where the victories of Howe off Brest, Jervis off Cape St Vincent, Duncan off Camperdown, and Nelson in Aboukir Bay, served to sustain the spirit of the nation. Other features of the time were the *threatened* invasion of Britain by the French, which called forth volunteer corps in every part of the island; the Irish rebellion, which, though assisted by a French force, proved a failure; and

Digitized by Google

the trial and condemnation at Edinburgh of the popular reformers, Muir, Palmer, &c. Pitt, who had left office just before the peace of Amiens, was succeeded by Addington, who was compelled to renew the war with Bonaparte in 1803, on account of the way in which the latter evaded fulfilling the conditions of that peace. Again, Bonaparte threatened to invade the country, and collected an immense flotilla at Boulogne, professedly for that purpose, in 1803, but was completely kept in check by Nelson. The battle of Trafalgar in 1805 nearly annihilated the navy of France and Spain. But on land, the arms of France were victorious; and the battle of Austerlitz (1805) broke up most effectually that coalition of continental powers against France which G. B. had fostered and formed. The shock of this disaster gave a death-blow to Pitt, who expired in the beginning of 1806, and was followed to the grave in the autumn of the same year by his rival, Fox. The overthrow of Prussia at Jena and Auerstadt, and of Russia at Friedland, placed G. B. in a most perilous predicament. All the nations of Europe were compelled by Bonaparte to exclude British merchandise from their ports, and the island of G. B. itself was declared in a state of blockade. Secure, however, in the protection of her invincible navy, she bore up bravely against her terrible isolation, increased her intercourse with her own vast colonies, ruined the commerce of her enemies, and never ceased her efforts to undermine the influence of her great enemy on the continent. The first people that shewed a tendency to revolt against the arrogant tyranny of Bonaparte were the Spaniards. G. B. at once offered to assist them with arms and money; and in 1808 a force was landed in Portugal, under the command of Sir Arthur Wellesley, afterwards Duke of Wellington. The war which ensued (known as the "Peninsular war") lasted till 1814, and ended in the French being driven back in disorder into their own country at Toulouse. Meanwhile, ruin had overtaken the French army in Russia; Austria, Prussia, and Russia had combined with G. B. against Bonaparte; and in 1814 the allies entered Paris, and the French emperor was forced to abdicate, and retire to Elba. His return in 1815 once more threw Europe into disorder and agitation; but his power was finally shattered at Waterloo by Wellington and Blucher, and peace restored to Europe. The contest had cost Britain (which had to subsidise most of her allies) an enormous expense. See DEBT, NATIONAL.

Now that the long conflict between France and Europe was over, the thoughts of the people were again turned to the question of political reform. Four years of extraordinary mercantile depression, which followed the victory at Waterloo, partly resulting from bad harvests, and partly from G. B.'s having ceased to enjoy that monopoly of commerce which she did during the war, had made the people discontented, and the shameful massacre of the Manchester operatives in St Peter's Fields by the yeomanry in 1819—commonly known as the Peterloo Massacre—excited strong indignation; but a horror of anything revolutionary still possessed the upper and a large section of the middle classes, and severe measures were passed with a view to the suppression of discontent among the working-classes. In 1820, George III. died, and was succeeded by his eldest son, George IV. The trial of his consort, Queen Caroline, which occurred in the same year, shattered his popularity, which was never very great. The commercial reforms of Huskisson, supported by Canning, which marked the next two years, added immensely to the prosperity of G. B., and capital grew so abundant, that a vast number of joint-stock companies were formed, as a means of giving it a wider range. Many of their projects for traffic in remote countries were quite visionary, and ended disastrously, involving in ruin (between October 1825 and February 1826) fifty-nine English provincial banks, and inflicting the greatest misery upon the working-classes. About the same time, the Irish Catholics began to clamor for emancipation from their civil disabilities. The older and more inflexible Tories, who were still dominant in parliament, opposed it; but the intense determination of the Irish people, and the powerful eloquence of their champion, Daniel O'Connell, at last prevailed, and in 1829 the ministry of Wellington, yielding to the storm, itself proposed and carried the measure. In 1830, George IV. died, and was succeeded by his brother, William IV. The outburst of the July revolution in France quickened the paces of British reformers; the demand of the nation for an improvement in the parliamentary representation became very strong; and in November 1830, after an exclusion from office of

Digitized by Google

nearly half a century, the Whigs once more ascended into power "on the breath of popular applause," and the ministry of Earl Grey immortalised itself by passing the "Reform Bill." Another of its claims to the respect and gratitude of posterity was the abolition of slavery in the British colonies (1834). The reform of the English poor-law, and in the mode of electing municipal authorities in Scotland, also deserves mention; but in 1834 the Whig ministry was dismissed by the sovereign. Sir Robert Peel now became premier, but the Whigs were still in a majority in the House, and Peel was compelled to resign. The Melbourne administration which followed carried several small though beneficial measures of reform, but it failed to secure the attachment of the people. The lower classes were becoming Radical and Chartist, while the middle classes, contented with the political power which the Reform Bill had secured to them, were growing apathetic, and in many cases, from dread of the masses, were leaning towards Toryism. In the midst of these perplexities, William IV. died in 1837, and was succeeded by his niece, the Princess Victoria, the present ruler of the united empire. In 1841, the Whig ministry succumbed to a vote of "no confidence," and Sir Robert Peel once more assumed the helm of state. The principles of free trade now began to be actively advocated; public opinion was leavened by the platform addresses of Mr Cobden and Mr Bright, until the prime minister himself was finally converted, and in 1846 carried, what he had long opposed, a measure for the abolition of the *Corn-laws*. Three years before the abolition of the corn-laws, a great religious schism took place in the Established Church of Scotland, and led to the formation of a body calling itself the "Free Church of Scotland" (q.v.). Other important incidents of this period were the Chinese and Afghan wars; the Chartist agitation, which reached its climax in the monster petition of 1848, got up by Feargus O'Connor and his friends; the series of failures in the potato-crop of Ireland, involving that country in terrible misery, and inundating G. B. with paupers. Sir Robert Peel was succeeded in the government of the country by Lord John Russell, who did not prove as popular a minister as was anticipated, and in 1852 the old Troy party returned to power, headed by the Earl of Derby and Mr Disraeli. It was, however, beaten on its budget, and forced to resign in less than a year, when its place was taken by the coalition cabinet of Lord Aberdeen. During the ministry of this nobleman, the *Crimean war* began (1854); but as Lord Aberdeen was considered to be somewhat pro-Russian in his likings, he was obliged to make way for Lord Palmerston in 1855. Two years later (May 1857), the Indian Mutiny broke out, and the energies of the government were taxed to the utmost to suppress it, but were eventually crowned with complete success. Never did British soldiers exhibit equal heroism, both physical and moral. From 1855 to 1865 (excepting for a brief interval, when Lord Derby returned to office), the government was in the hands of Lord Palmerston. During this period, England carried on a successful war against China, and the volunteer movement was begun. The American War caused great distress among our operatives. In 1861, Prince Albert died. In 1866, Earl Derby was at the head of affairs; Britain was united to America in that year by the submarine telegraph, and the Fenian insurrection occurred. The year 1867 was marked by the passing of a Conservative Reform Bill, which added more than half-a-million electors to the constituency of G. B.; and by the expedition against Abyssinia, under Sir Robert Napier, which, in 1868, resulted in the destruction of Magdala, and death of King Theodore. During the government of Mr Disraeli, who succeeded Lord Derby, Scotch and Irish Reform Bills were passed, and an act discontinuing public executions. In 1869, Mr Disraeli having resigned, an act was passed by the Liberal government under Mr Gladstone, for disestablishing the Irish Church. The years 1870 and 1872 produced the Education Acts for England and Scotland. In 1873–1874, the Ashantee (q.v.) War was carried on to a successful termination; and the latter year witnessed the establishment of a Conservative government under Mr Disraeli.

GREAT BRITAIN, Royal Arms of. The arms of the United Kingdom of Great Britain and Ireland are thus borne by her Majesty Queen Victoria.

Arms have been ascribed by heralds to the Saxon and Norman monarchs of England in the 10th and 11th centuries; but as heraldry was, in point of fact, unknown till the middle of the 12th c., they must be dealt with as fabulous. However, at a period almost before the earliest dawnings of hereditary coat-armor, the sovereigns of England, in common with various other monarchs of Christendom, adopted the

Digitized by Google

lion as their device. Richard I., in his earliest seal, has two lions, which are borne counter-rampant; but in the latter part of his reign, after his return from the third crusade, the great seal of Cœur-de-Lion represents three lions in pale and passant gardant, as they have been almost uniformly depicted since. The only subsequent instance of which we are aware of any variation in the number is on a seal of the Carmelites at Oxford, in which Edward III. is represented in a surcoat charged with four lions in pale passant gardant, a proof of the latitude which heralds occasionally allowed themselves as late as the beginning of the 14th century. In 1340, Edward III., in virtue of the supposed right of his mother, assumed the title of king of France, and quartered the arms of France with those of England, giving to the former the precedence. The fleurs-de-lis were then generally borne *sans nombre*; but in the latter part of the reign of Henry IV. they were reduced to three, borne or on a field azure. No further change took place in the royal escutcheon until the time of James I., except that Mary, on her second Great Seal, made after her marriage with Philip II., impaled the arms of Spain and England.

James VI. of Scotland, on succeeding to the throne of England, quartered the arms borne by preceding sovereigns with those of Scotland and Ireland, the first and fourth quarters being France and England quartered as before, the second quarter the lion rampant of Scotland within the double tressure (see SCOTLAND, ARMS OF), and the third quarter the harp of Ireland (see IRELAND, ARMS OF). The royal arms were similarly borne by all the sovereigns of the House of Stuart till the reign of Anne, except that William III. bore over all the coat of Nassau (az. semé of billets, a lion rampant or) on an escutcheon of pretence. In the reign of Anne, the legislative union with Scotland brought about a material change. England and Scotland impaled were placed in the first and fourth quarter, France in the second, and Ireland in the third. The accession of George I. displaced England and Scotland from the fourth quarter, to make way for the arms of his majesty's German dominions. These were gu. two lions passant gardant in pale for Brunswick, impaled with or, semé of hearts gu. a lion rampant az., for Lüneburg, having the arms of *ancient* Saxony—viz., gu. a horse courant ar. enté en base, and in a shield surtout gu. the crown of Charlemagne proper, being the badge of the arch-treasurer of the Holy Roman Empire. A further alteration took place on the union with Ireland, when George III. laid aside the titular assumption of king of France, and abandoned the French ensigns. The arms of England were now made to occupy the first and fourth quarter, Scotland the second, and Ireland the third, while the German ensigns were relegated to an escutcheon of pretence. These last were finally abandoned on the severance of Hanover from the crown of Great Britain, which took place on the accession of Queen Victoria, and the royal escutcheon thus assumed its present arrangement.

From the union of the crowns of England and Scotland under James I., up to the union of the kingdoms in 1707, the royal arms were somewhat differently marshalled in Scotland, Scotland being allowed in all Scottish seals, ensigns, and arms to occupy the first and fourth quarter, and England the second, while the whole were ensigned with the crown of Scotland; but the Act of Union of 1707 recognises no royal ensigns but those of the United Kingdom, which are to be "such as her majesty shall think fit;" and by 39, 40 Geo. III. c. 67, on the union with Ireland, it was enacted that the armorial bearings of the United Kingdom "shall be such as his majesty by his royal proclamation under the Great Seal of the United Kingdom shall be pleased to appoint. The practice, which prevails to a certain extent in Scotland, of giving the precedence to the Scottish lion in the royal shield, is incorrect, though the error has been committed in several of the official seals of the kingdom.

The lion passant as the *crest* of England first appears on the Great Seal of Edward III.

The *supporters* borne in former times by the kings of England varied much, particularly during the early period when these appendages of the shield were invested with more of a decorative than heraldic character, and perhaps often left to the fancy of the engraver. When the arms of any of the English sovereigns from Richard II. to Edward IV. are represented with supporters, the animals selected are almost indifferently lions, antelopes, or white harts, and occasionally their place is supplied by angels. Edward IV.'s shield is sometimes supported on one side by a black bull, and Richard III.'s in one instance—in a MS. in the British Museum—on

Digitized by Google

both sides by white boars. During the reigns of Henries VII. and VIII., Edward VI., Mary, and Elizabeth, the lion, red dragon, and greyhound were the supporters most in vogue, and as the herald or engraver had it not in his power to represent all three at once, he seems to have been allowed to select any two at pleasure. James I. for the first time clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne, the unicorn having been, up to 1707, allowed the precedence in Scotland.

GREAT CIRCLE or Tangent Sailing. In order to have a clear idea of the advantages of great circle sailing, it is necessary to remember that the shortest distance between two places on the earth's surface is along an arc of a great circle (see SPHERE); for instance, the shortest distance between two places in the same latitude is not along the parallel of latitude, but along an arc of a circle whose plane would pass through the two places and the centre of the earth. The object, then, of great circle sailing is to determine what the course of a ship must be in order that it may coincide with a great circle of the earth, and thus render the distance sailed over the least possible. This problem may be solved in two ways, either by means of an instrument called the "spherograph," or by the computation of a spherical triangle. The first of these methods will be explained under the head of Spherograph (q. v.).

From the theory of great circle sailing, the following most prominent features are at one deduced: A ship sailing on a great circle makes straight for the port, and crosses the meridians at an angle which is always varying, whereas, by other sailings, the ship crosses all meridians at the same angle, or, in nautical phrase, her head is kept on the same point of the compass, and she never steers for the port direct till it is in sight. As Mercator's Chart (q. v.) is the one used by navigators, and on it the course by the ordinary sailings is laid down as a straight line, it follows, from the previous observations, that the great circle track must be represented by a curve, and a little consideration will shew that the latter must always lie in a higher latitude than the former. If the track is in the northern hemisphere, it lies nearer the north pole; if in the southern hemisphere, it is nearer the south pole. This explains how a curve-line on the chart represents a shorter track between two places than a straight line does; for the difference of latitude is the same for both tracks, and the great circle has the advantage of the shorter degrees measured on the high circles of latitude. Consequently, the higher the latitude is, the more do the tracks differ, especially if the two places are nearly the same parallel. The *point of maximum separation*, as it is called, is that point in the great circle which is furthest from the rhumb-line on Mercator's chart. Since the errors of Dead-Reckoning (q. v.) prevent a ship from being kept for any length of time on a prescribed track, and thus necessitate the calculation of a new path, in practice, the accurate projection of a great circle track on the chart would be a waste of time. In general, it is sufficient to lay down three points—the place sailed from, the place sailed to, and the point of maximum separation, and through these points to draw an arc of a circle. As the rhumb-line and great circle track between two places, one in north latitude and the other in south latitude, cross each other at the equator, in this case there will be two *points of maximum separation*, and the course and distance must be calculated for each side of the equator separately. Many ignorantly object to great circle sailing on the ground that, on account of constant change of bearings, a ship cannot be navigated on the correct course; but, in fact, all that is required of a navigator is to sail as near to his great circle track as convenient; and each separate course will be a tangent to his track, and the shorter these tangents are made, the more will the length of a voyage be diminished. We may here mention that a chart constructed on the *Gnomonic Projection* (q. v.) represents all great circle tracks as straight lines. See NAVIGATION.

GREAT EASTERN. The mightiest ship in the world has had an eventful history, marked in its earlier years by a large share of disaster. In 1852, an "Eastern Steam Navigation Company" was formed, to maintain an ocean steam-route to the East round the Cape of Good Hope. In 1853, the directors came to the conclusion that, owing to the cost of maintaining coaling-stations on the way, such a route would not pay unless the ship could carry coal enough for the voyage out and home, besides a large number of passengers and a great cargo. Mr. Brunel was employed

Digitized by Google

to plan, and Mr Scott Russell to build, a vast steamer that would meet these requirements. The scheme was for a ship that would accommodate 1000 passengers, 5000 tons of merchandise, and 15,000 tons of coal, for fuel. Its arrangements (setting aside later alterations) were briefly as follows: Length, 680 feet between perpendiculars, or 692 feet upper deck; breadth, 82 feet, or 118 over paddle-boxes; height of hull, 60 feet, or 70 to top of bulwarks. Bottom flat for 40 feet in width, without keel. Framework of 85 ribs or webs of plate-iron, 3 feet deep, immensely strengthened, and extending from end to end of the ship, at 3 to 5 feet apart; and cross-webs of similar strength, connecting these at intervals. A double wall or skin of iron plate, outside and inside those ribs, thereby converting the whole hull into a cellular structure, like the top and bottom of the Menai Britannia Tubular Bridge. The plates for this purpose were 10,000 in number, some of them 28 feet long. The cellular structure was continued along the bottom, and about 5 feet up the side, and any one of the cells thus formed could be filled with water. Ten partitions of plate, crosswise of the ship, divided the interior into 11 watertight compartments, further subdivided by longitudinal partitions. The propelling power comprised both paddle and screw. The paddle-engines had 4 boilers, each with 400 brass flue-tubes; there was four engines (made by Scott Russell at Millwall), with cylinders of 14 feet stroke, and 74 inches diameter; the paddle-wheels were 56 feet diameter by 13 deep, with 30 spokes or radii. The screw-engines (made by Boulton and Watt at Soho) had 6 boilers; the 4 engines had cylinders, each 4 feet stroke by 84 inches diameter, with piston-rods 7½ inches thick; the propeller-shaft was 160 feet long, and in some parts 24 inches diameter, with a screw propeller at one end 24 feet in diameter. The coal-bunkers, to supply all the furnaces, would contain 14,000 tons; the smoke from the furnaces ascended 5 funnels, 100 feet high by 6 in diameter; each of the 10 boilers, when full of water, weighed 100 tons; the steam was conveyed from the boilers to the engines through a pipe 45 inches diameter. Setting aside the nominal power, all the 8 engines, at full force, were estimated to work up to 11,000 horse-power. There were 6 masts, 5 of them iron, carrying 7000 yards of sail as auxiliary to the steam-power; the masts, yards, gaffs, and large spars were mostly of iron plate, strengthened inside in various ways; the shrouds and standing-rigging were of iron ropes; the anchors, 10 in number, were some of them 10 tons each; the chain-cables were, collectively, a mile long, with links of 50 lbs. each. The vast wall-sided compartments of the ship had facilities for conversion into cabins for 800 saloon passengers, 2000 second-class, 1200 third-class, and 400 officers and crew; or 5000 might have been accommodated in all, if emigrants or troops. The height of the 'tween decks was 13 feet; and all, whether for first, second, or third class passengers, were more lofty than known in any other ship. Such were the plans for the mighty ship; they were never fully carried out in all their details, owing to numerous alterations and refittings; nevertheless, the description faithfully conveys an idea of the general characteristics. The curvatures of the hull, in length, breadth, and height are noticed in the article SHIP-BUILDING.

Twenty years of the ship's history present a singular series of vicissitudes. During 1854—1857, the operations proceeded at Millwall, under frequent and heavy financial pressure, which taxed the resources of the Company severely; while the engineer and builder were frequently called upon to surmount difficulties of almost unparalleled kind. By November 1857, the ship had advanced to the launching condition. In order to avoid the danger of launching such a long vessel stern foremost, the ship was built with the broadside towards the river, on a timber foundation of immense strength, with sloping ways, or rails, down to the water. Either the ship was too heavy (12,000 tons), or the slope was too gradual; for it required various attempts, between November 3, 1857, and January 31, 1858, and an expenditure of £60,000, to effect the launching. During 1858 and 1859, the work continued as fast as the Company could supply money. Uncertain how far the original intention of a trade to and from Australia could be realised, the directors determined on a trial trip across the Atlantic. It was a disaster. The ship left the Thames, September 8, 1859; an explosion of steam-pipes took place off Hastings; seven persons were killed and several wounded; and the voyage abruptly came to an end at Weymouth. Mr Brunel died immediately after his vast ship had made this her first but futile attempt to brave the ocean. After a winter and spring spent in costly repairs,

Digitized by Google

acrimonious recriminations, and suits in law and equity, the ship started again on June 17, 1860. Leaving Southampton on that day, she crossed the Atlantic in eleven days, and reached New York on the 28th. During the remainder of 1860, and the greater part of 1861, she made many voyages to and fro, losing money by the insufficiency of the receipts to meet the current expenses, and constantly required repairs. In December, when political relations with the United States looked ominous, the G. E. served as a troop-ship, carrying some battalions of Foot Guards over to Canada with a degree of comfort never before experienced by 2000 human beings in one ship.

The years 1862 to 1864 were nearly a blank as concerns the history of the *Great Eastern*. No attempt was made at a voyage to Australia and back: the trips across the Atlantic had not been remunerative; the government did not often require the services of so vast a fabric as a troop-ship; and the Company were always embarrassed by overhanging debts. In 1864 negotiations were entered into with the Atlantic Telegraph Company and the Telegraph Construction and Maintenance Company, for the employment of the G. E. as a cable-laying ship. The passenger accommodation was wholly removed from the interior, to make room for the enormous iron tanks in which the cable was stowed. The arrangement and services of the ship in 1865 and 1866, will be found briefly noticed under ATLANTIC TELEGRAPH. In 1867, when the Paris International Exhibition was approaching completion, a body of speculators chartered the G. E. for a certain number of months, to convey visitors from New York to Havre and back again—under the expectation that the number of such visitors would be so vast as to defray the whole of the expenses, and yield a large profit. A great outlay was incurred to reconvert the vessel from a cable-laying to a passenger ship, and for extensive renewals of machinery. The ship started from Liverpool for New York in May; but the speculation proved an utter failure, there being neither wages for the seamen and engineers, nor profit for the speculators.

In 1868 a new arrangement was made, by which the ship was to be permanently chartered by the Telegraph Construction and Maintenance Company. The name, which had been changed from *Leviathan* to *Great Eastern*, and then to *Great Ship*, was again changed to *Great Eastern*. The passenger fittings, introduced in 1867, were removed, and everything arranged for the important work of submarine cable-laying. This has been proved to be an advantageous mode of employment. Between 1869 and 1874 the *Great Eastern* successfully laid some of the most important telegraphic cables—across the Atlantic, in the Mediterranean, in the Red Sea, across the Indian Ocean, across the equator from Europe to Brazil, &c.

GREAT FISH RIVER is the name of two streams in opposite extremities of the British empire.—1. G. F. R. in Cape Colony rises in the Snowy Mountains; and, after a generally south-eastern course of 230 miles, it enters the Indian Ocean, in lat. 33° 25′ s., and long. 27° e., having at its mouth a bar, which renders it inaccessible to any decked vessel.—2. G. F. R. of British North America, known chiefly as the route of Back and King in search of Ross, enters an inlet of the Arctic Ocean, in lat. 67° 8′ n., and long. 94° 40′ w., after a n.e. course, the length of which, however, has not yet been ascertained. Its character is as unfavorable as its position to navigation and commerce.

GREAT KANAWHA, a considerable river of North America, and an affluent of the Ohio, is called New River in the upper part of its course, and rises in the north-west of the state of North Carolina, between Blue Ridge and Iron Mountain. It flows first north-east for upwards of 100 miles between parallel mountain-ranges, then turning north and north-west, it breaks through several ridges of the Alleghanies, and continues to flow in a north-west direction to its junction with the Ohio at Point Pleasant, after a course of about 400 miles. About 100 miles from its mouth, on being joined by the Gauley river, it takes the name of the G. K.; and two miles lower, its course is marked by a remarkably picturesque fall of about 50 feet. Up to this fall, the river is navigable.

GREAT MA'RLOW, a municipal and parliamentary borough in Buckinghamshire, finely situated on the north bank of the Thames, in lat. 51° 34′ n., and long. 0° 46′ w., 31 miles north-west of London. The Thames is here crossed by a suspension-bridge (constructed in 1835), which has a span of 225 feet. The principal

Digitized by Google

manufactures are silk, lace, and paper. G. M. returns one member to parliament. Pop. in 1871, 6627.

GREAT SALT LAKE, a remarkable and extensive sheet of water in the north of Utah Territory, North America, has given name to the Salt Lake City (q. v.), the Mormon metropolis, which is situated at its south-eastern extremity. It lies in one of the great valleys or basins of the Rocky Mountains, and is about 70 miles long and 30 miles broad, yet its average depth is only seven or eight feet, and it nowhere exceeds a depth of 33 feet. Its surface is 4200 feet above the level of the sea. In the middle of the lake, several islands rise as high as 3250 feet above the level of the water; the principal island is in lat. 41° 10′ n., and long. 112° 21′ w. The islands are 9 in number, one of them is 12 miles, and another 16 miles in length. The water of the lake is so salt as to form one of the purest and most concentrated brines known in the world. It contains 22 per cent. of chloride of sodium, slightly mixed with other salts. This lake, in whose waters no living creature is found, receives from the south, by the Jordan, the waters of the Utah lake, which are fresh, and those of the Wear river from the north; but it has no outlet. It has been called the "still innocent Dead Sea;" and certainly in the quality of the water, and the wild, weird aspect of the surrounding scenery, the lakes greatly resemble each other. The first mention of the G. S. L. was by Baron La Houtan, in 1689, who did not himself visit it, but who gathered some notions of it from the Indians west of the Mississippi. It was first explored and described in 1843, by Colonel Fremont. A thorough survey was made in 1849—1850—by Captain Howard Stansbury of the United States army, whose report was printed in 1852. See SALT LAKE CITY, and UTAH.

GREAT SEAL. By Act of Union between England and Scotland (5 Anne, c. 8), one Great Seal for the United Kingdom of Great Britain is used for sealing writs to summon the parliament, for treaties with foreign states, and all public acts of state affecting Great Britain. The holder of the Great Seal is now generally called the Lord Chancellor. A seal is also kept in Scotland for sealing grants and writs affecting private rights there. By the law of England the Lord Chancellor has the custody of lunatics, which is a *quasi* judicial power; but he has no authority to act in this capacity in Scotland, where a similar authority is vested in the Court of Session. As regards Ireland, the Act of Union, 39 and 40 Geo. III. c. 67, provided that various acts as to summoning parliament, &c., should be done under the Great Seal of the United Kingdom; but in other respects, the Great Seal of Ireland is used in the same manner as before the union.

GREAT SLAVE LAKE, an extensive and irregular sheet of water in British North America, is situated in lat. between 60° 40′ and 63° n., and in long. between 109° 3′ and 117° 30′ w. Its greatest length is about 300 miles, and its greatest breadth 50 miles. It is surrounded, especially on the north, by rugged and precipitous shores; it contains many islands, some of them wooded, and is wholly frozen over for six months of every year. On the north, it receives the surplus waters of Lake Aylmer and Lake Artillery, and on the south, those of Lake Athabaska. Its own surplusage of water is carried off by the Mackenzie River to the Arctic Ocean.

GREAT SLAVE RIVER, a river of British North America, forms the outlet of Lake Athabaska into Great Slave Lake, and flows in a north-west direction from the former to the latter. It is about 300 miles in length; its banks in many parts are well wooded; and its course, which in the upper part is interrupted by falls and rapids, lies through an alluvial region in the lower part.

GREAT WALL OF CHINA. See CHINESE EMPIRE.

GREAVES (Fr. *Grève*), pieces of armor formerly used as a defence for the legs (in the patois of Burgundy, *grève* still signifies "shin"). They were originally made of leather, quilted linen, &c., and afterwards of steel, hollowed to fit the front of the legs, and fastened with straps behind. The Greeks termed them *knêmides* (whence the frequent expression in the "Iliad," *euknêmides Achaioi*, the "well-greaved Greeks"), and the Romans *Ocreæ*.

GREBE (*Podiceps*), a genus of birds of the family *Colymbidæ*, having the feet webbed not in the usual manner, but by a separate membrane for each toe, united only at the base. The tarsi (shanks) are so much compressed as to be almost like

Digitized by Google

blades. The claws are large and flat. The bill is about as long as the head, straight, and conical. The wings are short. There is no tail. The legs are attached so far back, that the birds when on land assume an erect position, like penguins. They walk with difficulty, and all their motions on land are awkward. They sometimes shuffle along on their bellies like seals. But in water they are extremely agile; they swim rapidly, dive with extreme quickness if alarmed, and pass to very considerable distances under water, moving there by means of their feet alone, and threading their way with wonderful expertness among the stalks and leaves of aquatic plants. They feed on fishes, batrachians, crustaceans, and other aquatic animals, partly also on vegetable food. They are said sometimes to carry their young under their wings, and even to take them under water with them in diving to escape from enemies. The geographical distribution of the genus is very wide, and some of its species are also very widely distributed. Four species are British, two of which are only winter birds of passage; but the GREAT-CRESTED G. (*P. cristatus*), and the LITTLE G. (*P. minor*), also called DABCHICK or DOBCHICK, are resident all the year. The Little G. is by far the most common British species. It does not exceed ten inches in length. The Great-crested G. is rare, even in winter, when the number is increased by visitants from the north. It is sometimes called the SATIN G., from the beautiful shining silvery feathers of the lower parts of its body, on account of which it is in great request, the skin being used to make muffs for ladies, or cut into narrow strips for trimming their dresses. G.-shooting is a favorite amusement on the Lake of Geneva; the G. is pursued by a boat, whilst it seeks to escape by diving and swimming under water. The males of some of the grebes have the head finely ornamented with tufts. The plumage of most of them varies much at different ages and seasons.

GRECIAN ARCHITECTURE. The origin of the architecture of Greece is, like the origin of every art and science in that country, mixed up with mythical and fabulous history. It is divided into three styles, and each of these has its mythical origin. Thus the Doric is said to have been copied from the early wooden huts of the aborigines; the Ionic, which sprang up among the Greek colonists in Asia Minor, to have been modelled on the graceful proportions of the female figure, as the Doric had been on the more robust form of a man—the volutes representing the curls of the hair, the fluting the folds of the drapery, &c. The story of the origin of the Corinthian style is very pretty: a nurse had deposited in a basket on the grave of a departed child the toys she had amused herself with when alive. The basket was placed accidentally on the root of an acanthus, and in spring, when the leaves grew, they curled gracefully round the basket and under a flat stone which was laid on the top of it. Callimachus, the sculptor, seeing it, caught the idea, and worked out at Corinth the beautiful capital since called after that city.

Modern discoveries have however shewn that Greece owed much to the earlier civilisation of the countries which preceded it in history. To the architecture of one or other of these, almost every feature of Greek architecture can be traced. But it is for the first idea only that the Greeks are indebted to Egypt and Assyria; whatever forms they adopted, they so modified and improved as to make them part of their own architecture.

Grecian architecture is divided into three styles—the Doric, Ionic, and Corinthian (see COLUMN). Of these the Doric is the oldest. The earliest example which remains is the temple at Corinth, which was built about 650 B.C. The remains of this temple shew the various members of the style fully developed, but they are all of a massive and heavy description, strongly resembling in this respect their prototype the architecture of Egypt. There is now no doubt, although the intermediate steps are lost, that the Doric style took its origin from the rock-cut tombs of Beni-Hassan (q. v.) in Egypt. The pillars of one of these tombs appear at first sight to be Doric; it is only on close inspection that we find that the Echinus (q. v.) is wanting under the capital. The echinus was, however, used by the Egyptians. We here find ourselves in the cradle of Greek art. This is the spot where we must seek for the first origin of the style, not in Greece, where the earliest example is already complete in all its parts. The earlier the example, the more massive the form. This completely disproves the theory, that the pillars were copies of stems of trees used as posts. It seems more likely that the first pillars were square piers of rubble or brickwork, with a flat stone or tile laid on the top, to form a good bed for the

Digitized by Google

beams to rest on. These formed the architrave, stretching from pier to pier, on which rested the cross-beams supporting the rafters of the roof, the ends of the latter suggesting the dentils and modillions (mutules) of the cornice, the former, the triglyphs (see ENTABLATURE). The square form of the pier was afterwards modified by cutting off the corners, and again cutting off the remaining corners, until the polygon suggested the fluted shaft. The same process was afterwards gone through by the mediæval architects in developing the Piers (q. v.) of Gothic architecture.

After the temple at Corinth, the next remaining example is the temple of Ægina (q. v.), built about a century later, or 550 B.C. There may have been many temples of the same date, but none now exist; they were probably destroyed during the Persian war, or removed to make way for finer buildings during the great building epoch of Greece which succeeded that war, and when she was at the summit of her power. Of this epoch we have many remains. The temple of Theseus and the Parthenon at Athens (488 B.C.), that of Jupiter at Olympia (440 B.C.), Apollo Epicurius at Bassæ, Minerva at Sunium, and all the best examples of the Doric style of Greece, are of the age of Pericles. Besides the Peloponnesus, there are the countries colonised by the Greeks to which we can look for remains of Greek architecture. The Dorian colonists of Sicily and Magna Græcia carried with them the architecture of their native country, and furnish us with many fine examples. In Selinus there are six temples, the oldest being about the same age as that at Corinth. At Agrigentum there are three Doric temples, one of them founded by Theron (480 B.C.); this is the largest Grecian temple of the period, being 360 feet long by 173 feet broad. At Syracuse, Ægesta, and Pæstum there still remain many valuable examples.

As the Doric art progressed, the early massive forms gave place to more elegant and slender proportions. In the temple at Corinth the column is only 4·47 diameters in height; in the Parthenon, which is universally recognised as the finest example of the style, the column is 5·25 in height; and in later examples it becomes still taller and thinner, until it runs into the opposite extreme from which it started, and becomes so meagre and attenuated as to lose entirely the boldness and vigor of design which are the chief characteristics of the style.

One thing to be particularly admired in the Doric style is the beauty of the sculpture with which it is adorned, and the appropriate manner in which the sculpture is placed in the building, and the building suited for the sculpture. It has been shewn by Mr Penrose that every line was the subject of the deepest study on the part of the architect, for the purpose of correcting and allowing for all optical aberrations. The result is, that there is hardly a single straight line in the building; all the lines, which appear to be perfectly straight, are drawn with accurate curves, so as to produce the smoothest and most pleasing effect to the eye. Every harsh angle is softened, and every disagreeable combination of lines avoided. For example, the columns have an Entasis (q. v.) or slight swelling formed by a hyperbolic curve; the architrave of the front is curved upwards, so as to correct the optical illusion caused by the sloping lines of the pediment, and the columns are sloped slightly inwards, so as to give greater appearance of solidity.

The Parthenon is built entirely of white marble, and the whole of the masonry in this, as in other Doric works of importance, is put together with the most perfect workmanship.

There seems to be no doubt that this and other Greek temples were adorned externally with color. To what extent this decoration was carried, is not clearly ascertained; but it is probable that the exterior walls were covered with historical pictures, which were sheltered from the effects of the weather by the portico surrounding the temple. The sculpture was probably also relieved by a flat color on the background, and the mouldings decorated with painted or gilded ornaments.

Ionic.—This style took its rise about 500 B.C., and as we have seen that the earlier Doric was imported from Egypt, so the Ionic seem to have originated from the influence of Assyrian art. The recent discoveries of Layard and others have shewn that many of the characteristic ornaments of the style were in common use in Assyrian architecture. The volutes of the capitals are particularly indicative of an Eastern origin, the scroll being an ornament of very common use in all Eastern art.

The finest examples of the Ionic style remaining in Greece are the temples of the

Digitized by Google

Wingless Victory (*nikè apteros*) and the Erechtheum at Athens, built about 450—420 B.C. In the Ionian and other colonies of Asia Minor, also, many fine examples of this style were erected. The celebrated temple of Diana at Ephesus was of the Ionic order. It was the largest temple we know of up to its time, being 425 feet long by 220 feet wide. No trace of it now remains.

The Ionic is a graceful and elegant style, but not so pure and severe as the Doric. The latter is distinguished by simple and beautiful outline, enriched with the most perfect sculpture; the former trusts rather to ornamental carving for its effect. This love of elaborate ornament is an indication of the Eastern influence under which the style originated, and the mouldings and many of the ornaments are found to be identical with those of Assyrian architecture, only refined and simplified by the Greeks. The honeysuckle ornament, so commonly used both in Assyrian and Ionic architectures, is a good example of the improvement effected by the Greeks on the original type. In the Ionic as well as in the Doric, we find the most perfect execution and workmanship, the spirals, entasis, &c., being all drawn and cut with the greatest possible exactness.

Corinthian.—This style was the latest introduced, and combines, to some extent, the characteristics of both the preceding. It unites and blends together the Egyptian and Assyrian elements, the cap being probably derived from the bell-shaped capitals of the former country, ornamented with the carved leaves and spirals of the East. This order was first used about the time of Alexander the Great, the earliest example extant being the Choragic Monument (q.v.) of Lysicrates (335 B.C.). There are also the Temple of the Winds and that of Jupiter Olympius at Athens, the latter being one of the largest and finest examples of the style.

The Corinthian is the most florid of the Greek styles, and although invented by the Greeks, it was not brought into use till after the power of the republics, to which we owe the finest works of Greek art, had begun to wane. This style, from its richness and splendor, became afterwards the greatest favorite with the Romans, in whose hands Greek art became spread over the whole empire.

Caryatides.—Besides the above styles, which constitute *the Greek orders* of classic writers, the Greeks also used *Caryatides* (q.v.), or female figures, in place of columns, as in the Erechtheum and *Telamones* (q. v.), or giants, as at Agrigentum. These were probably derived from the figures used by the Egyptians in their architecture, but the latter never used them as columns; they always placed them as statues in front of the columns.

Greek temples are technically classed and designated by the mode in which the columns of the portico are arranged. The *cell*, or temple proper, is a square chamber contained within four walls; the simplest form of portico is called *distyle in antis*, the two side-walls being continued past the end-wall, and terminated with antæ, or pilasters, with two columns between.

When the portico has four columns between the antæ, it is called tetrastyle.

The temples have generally the same arrangement at both ends.

In front of both ends of the plan *distyle in antis*, there is frequently placed a range of six columns, and from the flank columns a row is continued along both sides. Such an arrangement is called *peripteral*, and the temple is designated hexastyle and peripteral. This was a common arrangement.

The Parthenon is an exception to the general rule: it has a hexastyle portico at each end of the cell, in front of which is placed an octastyle portico, and seventeen columns at each side.

The great temple at Agrigentum had seven columns at each end, and fourteen at each side, and was peculiar in having the space between the columns all round filled up with a wall. The reason probably was, that the space between the columns was too great to be spanned by architraves in single stones. The wall was pierced with windows.

Considerable doubt has existed as to the mode adopted by the Greeks for lighting the interior of their temples; that suggested by Mr Fergusson seems the most probable, as being similar to the plan used by the Egyptians and Assyrians. The interior had generally a double row of columns, one over the other, dividing the width into three spans. This arrangement still exists in the temple of Neptune at Pæstum. Mr Fergusson supposes that the light was introduced by counter-sinking a part of the roof, so as to admit the light between the pillars of the upper range,

Digitized by Google

thus forming a kind of clerestory. Windows, however, were also used, as in the temple at Agrigentum and in the Erechtheum.

The theatres of the Greeks formed another very important class of works; they consisted of semi-circular rows of seats cut in the rock, or partly built. Remains of these structures are found in all the countries inhabited by the Greeks, and were frequently of great size—that at Dramyssus being 448 feet across. The proscenia were the parts on which architectural design was chiefly displayed; but these have unfortunately all perished.

None of the palaces or domestic edifices of the Greeks remain to us; we are thus totally deprived of a very interesting chapter in the history of domestic architecture, for it is highly probable that the streets and houses of Greece, although not so splendid and enduring as the temples, were more varied in style, and exhibited many picturesque and beautiful forms, which are now entirely lost.

The attempt has been made in modern times to revive Greek architecture, and some ingenious modifications and adaptations of it have been carried out. But it was found that this style, so beautiful and appropriate in the warm and genial climate of Greece, was quite unsuited for our northern latitudes. The porticos are useless in a climate where external painting cannot last, and where the sunshine is courted rather than excluded; the pitch of the roof is not high enough to throw off our snows; and windows of sufficient size for our dark skies are not admissible. Grecian architecture has therefore been abandoned; and its place is now taken by a style more appropriate to our climate, and more suited to the feelings of the people.

GREECE. The name by which the ancient Greeks delighted to call their native country was Hellas (q. v.). The terms Græcia and Græci were first used by the Romans, being derived probably from a small tribe in Epirus, near Dodona, called *Graikoi*, with whom the Romans may be supposed to have been, from proximity, best acquainted.

Extent, &c.—This country, so celebrated in the history of freedom, of literature, of art, of philosophy, and of civilisation generally, varied much in size at different periods of its history. Hellas at first was applied only to a small district in Thessaly; at a later period, it denoted not only the Morea, and what is commonly called G. Proper, but also Macedonia, Epirus, and the islands of the Ægean.

Boundaries—(1) *Ancient.*—The northern limit of ancient G. may be fixed about the 40th parallel of n. lat., the south extremity being in 36° 23′. The barrier separating G. from Illyricum and Macedonia on the north, was that range of mountains which, starting from the Adriatic as the Ceraunian range, merges into the Cambunian ridge in the centre, and runs out into the sea on the east as the far-famed Olympus. The Ægean Sea washes the country on the east, the Mediterranean on the south, and the Ionian and Adriatic on the west. The greatest length is about 250 English miles, and the greatest breadth 180; the area (not including Epirus, but including Eubœa) is about 21,000 square miles—i. e., about two-thirds the size of Scotland. The Cyclades are reckoned by themselves, and amount to rather more than 1000 square miles. See *Islands* at end of article. (2) *Modern.* The extent of modern G. is much more limited. Its north boundary was fixed in 1834 by a line drawn from the Gulf of Arta (Ambracia) in the west, the Gulf of Volo (Pagasæ) in the east, thus excluding the greater part of Thessaly and all Epirus. The area of the present kingdom of G., with the islands, is about 20,000 square miles. The recommendation of the Berlin Congress of 1878, that Thessaly, south of the Salambria River, and Epirus, south of the Kalamas should be restored to Greece, has not yet (1879) been carried out.

Physical Conformation.—G. is essentially a country of mountains, hills, and valleys. From the ridge which forms its northern frontier, there starts in a southerly direction the Pindus chain, the back-bone of G., dividing Thessaly from Epirus, and giving origin to those numerous streams which water the mainland. About lat. 39°, it sends off two spurs to the east: Othrys (Gura), which terminates at the Gulf of Volo—and a little further south, Œta (Katavothra), at the extremity of which is the famous pass of Thermopylæ. Some ridges of less note run westward. From this point, the general central chain extends in a south-east direction (though with many windings), as far as Mount Cithæron, and even through Attica as far as Cape Sunium, under the names of Parnassus, Helicon, Cithæron, and

Digitized by Google

Hymettus; while in a south-west course we find many ranges crossing the country towards the Ionian Sea and the Gulf of Corinth (Lepanto), in a direction parallel with, or slightly inclined to, that of the central chain. The somewhat lateral range of Cithæron and Parnes, on the borders of Attica, is extended through Megaris into the Morea or Peloponnesus by a lower ridge, which, passing across the isthmus of Corinth, stretches even to the west coast. Of this range, the two most conspicuous points are Mounts Cyllene and Erymanthus, from which two chains run south on the east and west of Arcadia respectively, and under the names Taygetus (Pentedactylon) and Parnon (Malevó), terminate in the promontories of Tænarus and Malea. Besides these, there are many shorter chains and individual peaks, which it would be tedious and out of place to detail. It may be sufficient to state that there is no country of Europe, except Switzerland and the west parts of Scotland, which can be compared to G. in the extent, variety, and irregularity of its mountain system, and the number and character of its valleys. Of all the divisions of G., Arcadia is most like Switzerland in its rugged nature and generally elevated surface. Some of the mountain peaks of G. rise to a great height; thus Olympus is 9760 English feet, and is covered with snow; Guiona, on the frontier, 8240 feet; Parnassus, 8001; with many others of 7000, 6000, and 5000. Helicon is 4962; Cithæron, 4630; Cyllene, 7745; while the Acrocorinthus, or citadel of Corinth, is 1869 above the level of the sea. The mountains of G. are more remarkable for the suddenness of their rise than for their great elevation. So, too, there are many smaller peaks and cones notable for the abruptness with which they spring from the plain, such as the Acrocorinthus, the rock of Ithome, and the Meteora cliffs of Thessaly near the Penéus. These last are huge masses of rock standing out from the plain to heights varying from 100 to 300 or 400 feet, with sides perpendicular as a wall. They assume the shapes of pillars, cones, and other figures more or less regular; they cover a space of nearly two square miles, the recesses between the pinnacles being filled with trees and dense brushwood. The summits are occupied by monasteries, the only access to which is by baskets, nets, or ladders swung in the air.

Minerals.—G. is not rich in minerals; gold, silver, copper, lead, and iron are found, but the mines have never been worked with zeal. The most famous mines in ancient times were those of Laurium in Attica. Coal is found in Eubœa and in some parts of the Peloponnesus; salt is procured in many districts of G. and in the Ionian Islands; and marble of the purest kind, and of various colors, may be had in endless amount in almost all parts of Greece. The most famed quarries were in Paros, Carystus (in Eubœa), Pentelicus, and Hymettus. Marble and building-stone were quarried by the old Greeks to a very large extent. There are many mineral springs, both cold and warm, and many caverns still emit those mephitic exhalations which in bygone days quickened the imagination of the poet, and confirmed the superstition of the peasant.

Plains and Valleys.—The valleys of G. are very numerous, but owing to the great number and irregular courses of the mountain-ranges, are very small. The two great plains are those of Thessaly and Bœotia, the former being the largest and the most fertile in all G.; that of Messenia is both extensive and fertile.

Coast-line.—As Europe is pre-eminent among continents for the great extent of its sea-coast, so is G. for a similar feature remarkable among the kingdoms of Europe. The bays are very numerous, and many of them run far up into the land, so that no part of the country is far from the sea—a circumstance which gives the inhabitants great facilities for commerce, and which leads the modern Greeks, as it did the ancients, to occupy themselves in very large numbers with maritime affairs.

Water-system—(1) *Rivers.*—The rivers of G. necessarily follow its valleys in character. None of them are navigable. The most important stream is the Achelous (Aspropotamo), which rises in Mount Pindus, flows in a south direction through Epirus, and empties itself into the Ionian Sea, at the mouth of the Gulf of Corinth, after a course of about 130 miles. The Sperchens rises in the Pindus range, and disembogues into the Malic Gulf, after traversing for more than 60 miles the fertile vale which is bounded on the north by Mount Othrys, and on the south by Mount Œta. Besides these, there are in North G. the Cephissus, rising in Doris, near the base of Mount of Parnassus, and flowing through the fertile Bœotian plain into Lake Copais (Lago di Topoglia, or Lake of Livadia); and in the south part of

Digitized by Google

Bœotia, the Asopus (Vuriemi). In Peloponnesus, the principal streams are the Eurotas (Vasilipotamo) and the Alpheus (Rouffa). By the banks of this latter, the great Olympic games were celebrated. The rivers of G. depend for their supplies mainly on the atmosphere; hence in summer the larger streams are greatly reduced in size, and the majority of the smaller ones are either almost or altogether dry channels. Many of them are nothing more than mountain torrents, or gulleys, which the heavy rains of autumn and winter fill for a short season.

(2) *Lakes.*—The many hill-encircled valleys of G., from which there is no outlet, afford the most favorable opportunity for the formation of lakes; hence the rains of autumn and winter stagnate in many cases in the valleys of the mountains, and for at least a part of the year, form tiny lakes or tarns. Some of these are permanent, though with great difference in depth of water, according to the season of the year, while others degenerate in summer into reed-grown marshes and pestilential fens. See BŒOTIA.

Climate.—The climate of G. varies very considerably in different parts of the country. In the highlands of the interior, the cold in the winter is often very severe, snow lying for several months. On the plains, and in the lower districts near the coast, snow is seldom seen; but the north and north-west winds are frequently very trying, though there is no intense cold. The summer heat is often excessive; and the sirocco not unfrequently visits the south and lower parts. In moisture, too, there is much difference; thus, while Attica is remarkable for its pure air and beautifully bright sky, Bœotia has been famed from ancient times for the moisture of its climate and the fogginess of its atmosphere. The swampy valleys of Lake Copais and other marshy tracts, when acted on by the scorching heat of a summer's sun, produce those noxious vapors which are found in so many parts of G., breeding malaria and disease. This defect seems to have increased since classical times, either from the greater thinness of the population and the consequent diminution of tillage, or other causes not easily reached. But drainage would be an easy matter in a country whose rock-formation is of so soft a character as that of Greece. Were its natural advantages aided by drainage and irrigation, G. might yet become one of the healthiest and one of the most fertile countries of Europe.

Productions.—The more common products of Greek soil in ancient times were wheat, barley, and other cereals; flax, wine, and oil, with fruits of various kinds. The figs of Attica were and still are famed for the excellence of their flavor. Forests once covered many of the hills, and supplied timber for domestic purposes and for ship-building: they are still extensive in some parts. The most important productions of modern G. are those mentioned above, with maize, rice, millet, currants, and silk. Honey is produced in great quantity on Hymettus and in some parts of the Peloponnesus. The mulberry-tree is largely grown for the silkworm; and on the north and south shores of the Gulf of Corinth, as well as in Arcadia, and the west coast of the Peloponnesus, the Corinthian grape or currant is most extensively cultivated. Vines flourish in almost all parts, but the island of Santorin possesses the most famous vineyards, with the greatest variety of grapes, and furnishes a wine highly prized by the Russians. The olive grows in a wild state over all parts of G.; when ingrafted, it yields an excellent fruit, which the inhabitants pickle in very large quantity, as a staple article of food. The oil of the olive serves to supply light, and is used in cooking and for food, as we employ butter. Cotton, madder, tobacco, and leguminous plants grow in considerable quantity. Fruit trees are specially fertile; figs and apricots are plentiful and of excellent quality; oranges, citrons, lemons, pomegranates, almonds, water-melons, gourds, and others of less note are widely spread, largely produced, and of excellent quality.

Flora and Fauna.—The flora of G. resembles that of other countries of South Europe. Among the tame animals of ancient G. were the horse, mule, ass, ox, sheep, goat, swine, dog. The swine supplied the favorite flesh meat. Of wild animals, we find the wolf, bear, boar, and even lions at an early period. Sheep and goats are still very plentiful, and in fact constitute one of the most important sources of wealth to the Greeks. Oxen are much used for ploughing, but milch cows are little prized, and scarce. At the present day, the wolf, bear, lynx, wild-cat, boar, stag, roebuck, fox, jackal, badger, marten, and many other wild animals are found in the forests. Hares, snipes, wild-ducks, and other game are very abundant; while eagles, vul-

Digitized by Google

tures, hawks, owls, &c., are found in considerable numbers. The tortoise is very common, but the inhabitants have a great aversion to it.

Agriculture.—The agricultural implements are still as rude as in the days of the Peloponnesian war, or even of Hesiod; and this, added to the scarcity of ploughing oxen, ruggedness of the country, general thinness of soil, and difficulty of tillage and irrigation, is enough to damp the ardor of even a more energetic population. The houses of the country-people are in most parts little better than mere hovels, and a large proportion of the arable land is untilled. The modes of tillage are of the most primitive kind; and thus, though nearly half the male population of G. is employed in agricultural labors, they make but slight impression on the general aspect of the country, and influence little the amount of exports; in fact, they do not produce as much grain as supplies the wants of the population, and that, too, though a higher yield is given in many parts of G. than in this country. Much labor, however, is bestowed on the cultivation of the olive, vine, mulberry, and fruit trees. The greater part of the land belongs to the state; rent is paid in kind, and in a certain proportion (one-third) to the net produce. The proprietor is in very many cases obliged to furnish the *metayer*, or tenant, with seed to sow the ground, and with oxen to plow and prepare it; and as the metayer has an interest in the farm for only one year, there is little encouragement for either landlord or tenant to expend largely in improvements—such as drainage, fences, clearing of the soil, and comfortable farm-steadings. The country, however, is better suited for a pastoral than an agricultural people. Arcadia is still the land of shepherds, as it was of old. The flocks are driven to the valleys near the coast in winter, and in April to the hills.

Manufactures.—The manufactures are few and unimportant. Cotton and woollen stuffs, and some minor articles are made by the peasantry for domestic use. Shipbuilding is carried on at most of the seaports; and silks, gauze-stuffs, cutlery, hardware, earthenware, leather, saddlery, and such articles are made in small quantities in some of the principal towns, and more especially on the islands. The Greeks have great skill in embroidering in silk, gold, and silver; also in sculpture, and in the cutting of marble. Carpets are made in the island of Andro, and straw-hats at Lifanto. The modern Greeks are not behind their great ancestors in the art of dyeing in bright colors.

Commerce.—Every circumstance tends to make the Greek a man of commerce. He is of a quick, active, versatile, and practical turn of mind, and possesses all those qualities which insure success in business. The bays and gulfs of the sea-indented shore allure him to the waters, while the strong currents and frequent squalls on his iron-bound coast soon render him an expert and fearless seaman. The islanders are thrown into a seafaring life even more than the people of the mainland. G. occupies a position in the Mediterranean, which, for commercial advantages, cannot be surpassed. The exports of ancient times were of course mainly the produce of the soil, the trees, and the mines; and the same do they remain at the present day. Raw produce, as cotton, corn, currants, figs, and other fruit, tobacco, olive-oil, honey, wax, gum, valonia bark, silk, and sponge are the most common. From Western Europe manufactured goods of all kinds and the produce of our colonies are largely imported; while Turkey, from her provinces in Europe and in Asia, supplies coffee, rice, timber, drugs, and other articles of eastern growth. The Greek merchants speculate largely in the grain trade. The principal seaports are Syra, Pireus, Patras, and Nauplia, and the ports with which they trade most are Constantinople, Leghorn, Trieste, Palermo, and Smyrna. The mercantile navy of G. is very large, amounting to upwards of 6000 vessels, many of 500 or 600 tons, but the majority are small-craft, for short voyages from island to island, or to ports near Greece. It is as agents and carriers that the Greek ship-owners are specially engaged. They are, in fact, the great commission-agents and carriers of the Mediterranean. Greek merchants have now established themselves in London, Liverpool, Manchester, Glasgow, and other towns of the British empire, as well as in those of France and of Germany; and as they have greater facilities for collecting articles of commerce from the inland parts of their own and contiguous countries, besides, as they despise no sort of commission or merchandise, however small or insignificant, they now usurp almost the entire traffic of the Ottoman empire, of Persia, and of other eastern countries.

Internal Commerce.—But one great drawback to the development of Grecian

Digitized by Google

resources, and the increase of a home commerce, is the miserable state of the internal communication. Without a navigable river, with not a single canal, and with less than 100 miles of road fit for a donkey cart in the whole extent of its territory, it is little wonder that the inland inhabitants are devoid of energy and enterprise, and that they consume but little of the imports from abroad. Mules, asses, horses, and men carry on their backs over rugged paths, and through mountain passes, the scanty supplies of foreign luxuries and necessaries for the Greek peasant of the interior. Even from Athens to Corinth there is no carriage-road!

Political Divisions.—In ancient times G. was divided into a great number of petty states, each consisting of at least a city and some portion of surrounding territory. There was no king ruling over the whole country, no federal union which embraced all the states, no common council or government. Amphictyonic leagues did exist at one period, and in later times the Achæan and Ætolian leagues were formed with patriotic and national objects in view, but these applied only to a limited area, and were of only local operation; hence quarrels were of constant occurrence, and G. wasted on internal struggles those energies and means which, if properly husbanded, united and directed, might have raised her to the very pinnacle of fame and of prosperity in every department of human industry and human exertion. It was only when some monster danger threatened universal destruction that all united for the common good, as in the Persian invasions, and even then jealousies and selfish interests caused many to join with those who sought to ruin the fatherland. The divisions of ancient G., as laid down on maps, afford a very imperfect idea of the political condition of the country, singly or relatively; but as they have been so long known to the world under certain names, it will be best to mention them as usually given. Starting at the south-east, we have the triangularly shaped Attica, separated from Bœotia on the north by the range of Cithæron and Parnes, Bœotia, Phocis, Doris, Locris, Ætolia, Acarnania, Epirus, Thessaly, and Eubœa; and in the Peloponnese, Argolis, Laconia, Messenia, Elis, Achaia, and Arcadia, with Megaris, partly on the isthmus of Corinth. By the existing arrangements, modern G. is divided into thirteen provinces or nomarchies, which are again subdivided into fifty-nine eparchies, and these again into demarchies or cantons. Of the nomarchies there are in Hellas, or Northern G., Attica and Bœotia, Phocis and Phthiotis, Acarnania and Ætolia: in the Peloponnesus, Argolis and Corinthia, Achaia and Elis, Arcadia, Messenia, Laconia: in the islands, Eubœa, the Cyclades, Corfu, Zante, Cephalonia. See ATTICA, BŒOTIA, EUBŒA, &c.; and for Cyclades, see section "Islands" at end of this article.

Government.—In ancient G. each state managed its own affairs, and governments were of different kinds. In Homeric times, monarchy seems to have prevailed to a considerable extent, but in later years republics, aristocracies, and oligarchies almost entirely usurped the ruling power; factions were rife, and in many cases their contests led to a total disruption of the body-politic. The present constitution of Greece was arranged by an assembly elected in December 1863, and adopted October 29, 1864. The whole legislative power is vested in the Boul , or House of Representatives, the members of which are elected by manhood suffrage for four years. The elections take place by ballot, and the chamber must meet annually for not less than three, nor more than six months. There must be an attendance of at least one half of the members to give legality to the proceedings, and no bill can become law without the consent of an absolute majority of members. The assembly has no power to alter the constitution itself. The Chamber of Deputies meets, on ordinary occasions, on the 1st November (O.S.) of every year. The number of members varies with the population, but in 1875 it was 188. The executive is vested in the king and the ministers at the head of the following departments, who are responsible for the acts of his majesty: Ministry of the Interior, Finance, Justice, Education and Ecclesiastical Affairs, War, Marine, and Foreign Affairs. There is also a deliberative council of state, whose members are named by the crown, and hold office for two years. There must not be less than 15, or more than 25. To this council must be sent all bills from the chamber of deputies, and returned with observations or amendments within ten days; but this term may be prolonged for 15 days more. If no report is then made, the deputies may pass the law and send it up to the king. The education of the people is undertaken at the public cost; offices of state and positions of distinction are open to all. (See articles on individual cities and states.)

Digitized by Google

Administration of Justice.—The supreme court of justice is called, as in Athens of old, the Areopagus. Besides this, there are four courts of appeal, 16 courts of primary jurisdiction, the court of assizes, and 175 justice-of-peace courts, with all the orthodox accompaniments of lawyers, juries, notaries, &c. There is a complete code of laws to meet all the cases which may arise between man and man. Capital punishment is exigible for certain offences, the guillotine being the instrument of execution. The most numerous class of felons are brigands and assassins. The Greek judges enjoy a well-earned reputation for independence and strict uprightness.

Army and Navy.—Under a law promulgated in 1876, the military forces of G. are divided into four parts—the regular army, the regular reserve, the militia, and the militia reserve. All Greeks between 19 and 30 years of age, not serving in the regular army, are placed in the regular reserve; those from 31 to 40, in the militia; and those from 41 to 50, in the militia reserve. The whole strength of the army under the bill is estimated at 200,000, 120,000 of whom belong to the regular army and its reserve, 50,000 to the militia, and 30,000 to the militia reserve. The number of the regular army is usually about 15,000. At the commencement of 1875 the navy consisted of 1 ironclad, 6 screw steamers, 4 schooners, 2 cutters, and the royal yacht. It is useless as a defence from foreign powers, and serves only to repress piracy, and that in an ineffective way. The naval station is Poros, at the entrance of the Gulf Ægina.

Money, Weights, and Measures.—The unit of the monetary system is the Drachma (q. v.) = 8½*d.* English; the unit of weight is the oke = about 2 lbs. 11 oz. avoirdupois; the common measure of length is the pique = 27 inches. A stremma of land is about ¼*d* of an English acre.

Finance.—The financial affairs of G. seem to be in a state of hopeless bankruptcy. The kingdom started on borrowed capital, the three great powers of England, France, and Russia having guaranteed a loan of 60 millions of francs (£240,000), partly to indemnify Turkey and other creditors of G., and partly to assist agriculture and manufacturers in their early struggles. The expenses of the court and government, the carelessness of officials, and the non-receipt of the taxes, have added to the embarrassment of the exchequer, so that at the present time the Greek treasury owes upwards of 483,000,000 dr. (£17,479,000) nearly a third of which is due to the three powers, and the remainder to capitalists, principally in England.

Inhabitants (Ancient Greece).—Of the earliest inhabitants of ancient Greece we have no definite knowledge. The term *autochthones* (sprung from the soil itself—earth-born), which the Greeks applied to themselves, means no more than this, that the people had been there from time immemorial, and that future generations had not the means or the inclination to trace their origin any further back. At a very early period the population of G. was largely, if not entirely, composed of Pelasgians (q. v.). It is most probable that the Hellenes were only a branch of this great Pelasgian stock, but possessing more energy of character, they gradually spread themselves over the greater part of G., and supplanted the language and institutions of the Pelasgi by their own. Thus they became the ruling race, and gave their name to the country.—*Modern Greece.*—The population of modern G. is of a very mixed kind. In Ætolia, Acarnania, Thessaly, the greater part of Peloponnesus, and most of the islands, the descendants of the old Greeks are still predominant; but a very large admixture of Albanians (see ALBANIA) prevails in Attica, Bœotia, Phocis, and Argolis, with the islands of Spezzia, Salamis, Hydra, and Andro. The true Greek is easily recognised by his tall stature, slim body, aquiline nose, oval face, and moustache. Whiskers are not considered staid and respectable; the beard is worn only in mourning. The Greeks are uncommonly temperate both in eating and drinking, and in the indulgence of the passions generally; flesh is seldom eaten; the diet is principally vegetable. The Greeks are devotedly attached to their fatherland, and their love of liberty and independence is not less strong than it was in the days of Miltiades and Themistocles. Aristocracy is, in consequence, at a discount; and though they love and are loyal to a good ruler, yet they are easily roused into resistance by the infringement of their rights. Commercial bargains are the delight of the Greeks, and they often manage, it is said, to part with their wares at twice their value. This deceit they practise against the Turks especially. The Greek women are very plain. Early marriages are common in Greece. Greek

Digitized by Google

matrons take great pride, like Niobe of old, in a numerous and beautiful offspring. But many of the children are cut off in infancy by the fevers which prevail so commonly. Two peculiar branches of the Greek race are—the Mainotes (from a district called *Maina*) of the Peloponnesus, and the Palikars of the north highlands. The former, who boast to be the descendants of the ancient Spartans, inhabit principally the mountain fastnesses of Taygetus, where for centuries they defied the power of the Turks. They resemble in their sturdy independence, feudal relations, robbing propensities, and other characteristics, the Highlanders of Scotland 150 years ago; but in recent times, education, intermixture with other races, and commerce, have to a great extent removed their distinctive peculiarities. The Palikars, that is, *Braves*, originally belonged to the northern parts of G.; but when Thessaly and other portions were by treaty left in the hands of the Turks, these hardy mountaineers chose to leave their ancient homes and settle in the new kingdom, to establish which they had shed their blood. The red cap, the white shirt, and the golden jacket, mark them out even to the casual observer as a separate class. They go about armed, and attended by armed followers; their houses are fortresses, and their servants form a little army. The islanders are almost all seamen or traders; they wear the red cap, a short jacket, and wide Turkish trousers. The Albanians form about a fourth of the population; they are a strong, hardy race, and engage in agricultural or other severe labor. They are the hewers of wood and drawers of water to the more wealthy classes. They speak a language which is little allied to either Slavonic or Greek. The Wallachs are a nomad and pastoral race; they sleep on the hillsides with their flocks, which are guarded by ferocious dogs. There are large numbers of Maltese at Athens, and the Piræus especially. There are few settlers from Western Europe. The Bavarians who swarmed into G. on the accession of King Otho have almost all disappeared.

Religion.—See the articles GREEK RELIGION (Ancient), and GREEK CHURCH.

Education (*Ancient*).—The education of the ancient Greeks was more of a physical than of a mental kind. The *gymnasium* was that of the athlete, not that of the *didaskalos* or perceptor. Young children were, till about their sixth year, trained at home under females, but were then sent to the *didaskaleia*, or schools under the charge of private tutors or pædagogi. The duty of the pædagogus was rather to keep his wards from outward injury and bad companions, than to teach them the accomplishments of grammar (including reading, writing, and arithmetic), music, and gymnastics, the favorite subjects of study in those days. In later times, the more intelligent slaves were specially trained for the duties of the pædagogus.—*Modern.*—Education of all kinds, from the humblest school to the university, is free to all. Hence an unusual number of Greeks press into the learned professions, and a large educational machinery is necessary to supply the demand for knowledge. There are about 370 communal or elementary schools, and 180 Hellenic schools, in which, among other branches, ancient Greek is taught. Besides these, there are eight gymnasia, four medical schools, one theological, one military, one agricultural school, one school of arts; and finally, there is the university of Athens, which possesses the four faculties of theology, philosophy, law, and medicine. All these institutions are well attended, and the youth of all ages are most zealous in prosecuting their studies.

Language (*Ancient*).—The Greek language is a branch of that widespread family of tongues, usually called Indo-Germanic or Aryan. It prevailed not only in the different parts of G., but also in the numerous Greek colonies which fringed the shores of the Euxine and the Mediterranean. But it must not be supposed that it was of the same type at all periods of Greek history, or in all parts of G., even at the same time. The three great branches of the Greek tongue were: 1. The Æolic, the oldest form, and which presents the greatest affinity to the Latin and other members of the Indo-Germanic stock. 2. The Doric, a highland dialect, delighting in broad and rough sounds; it was spoken in the mountains of Thessaly, whence it travelled southward, and on the migration of the Dorians, took possession of the Peloponnesus. 3. The Ionic, a soft and vocal language, delighting in vowel sounds, and avoiding the harsh combination of consonants; it was spoken principally by the people of Attica and the Ionian colonies in Asia Minor. From it was made, by a series of contractions and modifications, that most perfect form of the Greek language, the *Attic*, which was neither so harsh and broad as the Doric, nor so soft,

Digitized by Google

and vocal as the Ionic. It was brought to the height of perfection by the poets, the philosophers, and the historians of G., whose writings still teach the world, and command its admiration. By the conquest of Alexander the Great, the Greek language soon spread over a large part of the then known world, but corruption at once set in—words of other languages were adopted into the Greek, foreign idioms were introduced, and the rigid syntax of the great Athenian writers was neglected, so that, in process of time, there arose a depraved form of speech, called the Hellenistic, varying in many essential points from its great parent. In this last form, the books of the New Testament were written. The process of deterioration still went on till about the middle of last century; when at length the spirit of the Greek nation again arose, and amidst other endeavors to revive the ancient glory of their race, an attempt was made, and is still being made, and that too with great success, to restore the purity of the language. This leads us to the *Language of Modern Greece*.—In different parts of Greece, different languages are spoken according to the element which predominates in the population. Thus Turkish prevails in some districts, Albanian in others, Wallachian in others, and Bulgarian in others; but in the greater part of Greece proper, the language is *Romaic Greek*, or as it is now more usually and more properly called, Neo-Hellenic. This language bears a very close resemblance to the Hellenic, or classical Greek; and in fact does not differ more, if so much, from the Attic, as the Attic differed from the Doric. Information on this subject must be sought in a grammar of the language. Great efforts have been made in recent years to purge the Neo-Hellenic of barbarisms and foreign terms, and it is now written with such purity, that good scholars in ancient Greek will have little difficulty in understanding Tricoupi's history or an Athenian newspaper.

Literature (*Ancient*).—The literature of Greece is a subject so extensive, that we cannot hope to give any adequate view of it in our limited space. Those who wish to study the matter further, must have recourse to a full treatise. Poetry seems to have been the earliest form of composition among the Greeks, as indeed it must of necessity be in all nations, for facility of recollection; hence *Memory* is called the *Mother of the Muses*. The earliest species of poems seems to have been hymns in honor of the gods; to these succeeded songs praising the glorious deeds of heroes; but the greatest poem of ancient times which has come down to us is the "Iliad" of Homer, detailing the events connected with the siege of Troy, and the warriors who took part in that famous expedition. The "Iliad" and "Odyssey" have been too long and too generally known and admired to need a word said in their commendation. The remarkable popularity of the Homeric poems produced a host of imitators; and hence we find that a great many poets endeavored to rival the fame of the "blind old man," by narrating in verse the after-fate and vicissitudes of the heroes who took part in the war of Troy, or by treating of subjects allied to that of the "Iliad," and even of mythological fables. These were called the Cyclic poets; they were posterior to Homer and Hesiod; their writings were put together in chronological order by some Alexandrine grammarians about 200 B. C. The Homeric period is closed by the name of Hesiod. Homer is supposed to have flourished about 900 B. C., and Hesiod about 850 B. C. Hesiod's most celebrated writings are the "Theogony," the "Shield of Hercules," and the "Works and Days," an agricultural poem. Of his others, only small fragments are preserved. Epic poetry culminated in Homer, and with him and his contemporaries it sets. Of lyric poetry, there were two schools—the Æolic in Asia Minor and adjacent islands, especially Lesbos, and the Doric in Peloponnesus and Sicily. Of the Æolic school, the earliest poet was Callinus (700 B. C.); after him came Archilochus, so famed for his cutting satires, written in iambic verse; Tyrtæus, and Simonides of Amorgos, who contests with Archilochus the honor of having invented iambic verse. Alcæus and Sappho (about 610 B. C.) represent the Æolic school in its perfection. Nor must we forget the school-boy's favorite, Anacreon (about 520 B. C.), to whom, however, are attributed many pieces which are not considered genuine. Of the Doric or choral school, it may suffice to mention Alcman, Stesichorus, Arion, Simonides, Bacchylides, and greatest of all in every known variety of choral poetry, Pindar (q. v.) the Theban (522 B. C.).

Greek literature reached its highest perfection in the tragedies of Æschylus (born 525, died 456 B.C.) Sophocles (born 495, died 405 B.C.); and Euripides (born 480,

Digitized by Google

died 406 B.C.). The writers who endeavored to follow in the track of these three great masters were of far inferior merit, and with them tragedy degenerated to the effeminacy of lyrical songs and mere rhetorical bombast.

Comedy, like tragedy, took its origin from the worship of Bacchus. The three great names of the old Attic comedy are Cratinus, Eupolis, and Aristophanes (born 452, died 380 B.C.). In middle comedy, we have the names of Antiphanes and Alexis; and in new comedy, Philemon and Menander.

History did not engage the attention of the Greeks till a comparatively late period. Passing over the names of Cadmus of Miletus, Pherecydes of Scyros, Hecatæus, and Charon of Lampsacus, we come to Herodotus, the Father of History, or, as he has been called, the Homer of History, who flourished about 440; Thucydides, about 430; and Xenophon, about 400. In later times, we find Polybius (204—122 B.C.); Dionysius of Halicarnassus, who flourished about 20 B.C.; Diodorus Siculus, a contemporary of Julius and Augustus Cæsar; Plutarch; Appian (in time of Hadrian and Antoninus Pius); Arrian (time of Hadrian); and Dion Cassius. In geography, we have Strabo and Pausanias. In satire, the palm is carried off by Lucian (q. v.). In oratory, it may be sufficient to mention the names of Antiphon (born 480 B.C.), Andocides (467 B.C.), Lysias (458 B.C.), Isocrates (436 B.C.), Æschines, the great rival of Demosthenes (389 B.C.), Hyperides; and last and greatest of all, Demosthenes (385 B.C.). On the philosophers, see PHILOSOPHY.

Literature (*Modern*).—The literature of modern G. is still in its infancy. No work of importance appeared previous to the revolution; but since the establishment of the kingdom in 1829, more life has been infused into the men of a literary bent. The names of the brothers Panagiotis and Alexander Soutsos are well known to many in England. They have written dramas, love-songs, novels, lyrics, and a poem (by Alexander) in the style of Byron's "Childe Harold," detailing the wanderings, sights, and adventures of a Greek in France and Italy. In most of these there is much merit, though few readers can fully appreciate the style and handling. Among dramatic writers, Neroulos, Rangavis, and Charmouzis hold a foremost place. "The Memoirs of Different Battles fought between the Greeks and Turks from 1820 to 1829," by Perrevos, is a well-written book. In grammar and lexicography, Bamvas, Gannadios, Scarlatto Byzantino, and others have done good service to the cause of learning. But of all the Neo-Hellenic works yet published, the "History of the Greek Revolution" by Tricoupis is the most valuable—valuable not only for its statement and facts, but also for the purity and elegance of its style. Many newspapers and other periodicals, in Neo-Hellenic, are published at Athens, Constantinople, London, and elsewhere; but the expense of these literary efforts is in most cases borne by wealthy Greek merchants, now so frequently met with in the west of Europe. It will require many years of good government, of national industry and prosperity, before G. can expect to assume that position in the world of letters which the prestige of her name entitles her to anticipate.

History (*Ancient*).—The early history of G. is lost in the mist of ages. The legends of gods and heroes, which constitute her only approach to history, are of that marvellous kind in which a superstitious and ignorant age delights. But how much truth may underlie the stories of Cecrops, Cadmus, Danaus, Theseus, Hercules, and many others, it is difficult to say; or to what extent the events of the Argonautic expedition, Trojan war, hunt of the Calydonian boar, and other joint-stock exploits, may be real, historians can never hope to discover. The heroic age is roughly estimated as continuing from 1400 to 1200 B.C.; but all Greek chronology is mere guess until the first Olympiad, 776 B.C. Of the migrations which took place during these early days, and of the numerous colonies planted by the Greeks, it is unnecessary to speak in this brief sketch; nor can we do more than merely refer to the wars of the Spartans against the Messenians, which, beginning in 743 B.C., did not ultimately terminate until Ithome was destroyed in the third Messenian war, 455 B.C. Meantime, wars of less magnitude are carried on in different parts of Greece; Solon legislates at Athens (594 B.C.); Pisistratus and his sons enjoy the "tyrannis" at Athens from 560 B.C. to 510 B.C.; Crœsus, king of Lydia, and Cyrus the Great, his conqueror, are brought into contact with the Asiatic Greeks (560—542 B.C.). And now, in 499 B.C., the burning of Sardis by the Athenians and Ionians leads to those three invasions of G. by the Persians which ended so gloriously for G., and so disastrously for Persia, and with the particulars of which all are so well acquainted. The first, under Mardonius, in 492 B.C., is averted by the shipwreck of the

Digitized by Google

invading fleet off Mount Athos; the second, under Datis and Artaphernes, in 490 B.C., is hurled back from Marathon; and the third, under Xerxes, 480 B.C., is utterly shattered at Thermopylæ, Salamis, and Platæa. G. is now a mighty name, but the Athenians become the ruling state, and their supremacy continues till 404 B.C. Meantime, disunion at home succeeds the contests with foreign enemies. The great Peloponnesian war begins in 431 B.C., and wastes the energies of G. for 27 years, until the subjugation and partial demolition of Athens in 404 B.C., put an end for a time to the fratricidal struggle. It was in 415 B.C., the 17th of this war, that the famous and unfortunate expedition to Sicily took place. Under Pericles, who was the ruling spirit at Athens at the commencement of the war, but who died of the great plague in 429 B.C., the Athenians reached the highest pitch of excellence in sculpture and architecture; then were raised some of those wondrous buildings whose remains still excite the admiration of posterity at a distance of more than 2000 years. In 401 B.C., the expedition of Cyrus the Younger to dethrone his brother Artaxerxes, took place; the battle of Cunaxa, in which Cyrus was slain, was fought in the same year. Cyrus had employed Greek mercenaries, and this brief war is specially famed for the masterly retreat of the 10,000 Greeks under Xenophon the Athenian, in 401—400 B.C. The next year (399 B.C.), Socrates, the philosopher, the teacher of Plato and Xenophon, was put to death. After the defeat of the Athenians in the Peloponnesian war, the Spartan state became the leading power in G., and was engaged in four wars in succession—1st, the Elean (399—398 B.C.); 2d, the Corinthian (395—387 B.C.); 3d, the Olynthian (380—379 B.C.); 4th, the Theban (378—362 B.C.). The great Spartan hero of these troublous times was Agesilaus, whose panegyric has been written by Xenophon with a friendly pen. During these eventful years were fought the battles of Coronea and of Corinth (394 B.C.), Orchomenus (375 B.C.), Leuctra (371 B.C.), Mantinea, in which the Theban hero, Epaminondas, was slain, 362 B.C. In 359 B.C., Philip ascends the throne of Macedonia, and a few years afterwards finds occasion to intermeddle in the affairs of Greece. Some of the allies of Athens renounce his supremacy, and thus arises the Social war (357—355 B.C.), in which Athens loses many of her tributaries, and much of her revenue. The Sacred war (355—346 B.C.) immediately follows, in which Philip takes part. About this time (352 B.C.). Demosthenes delivered the first of those powerful orations against Philip, called Philippics. In the battle of Chæronea (338 B.C.), the Athenians and Thebans are utterly defeated by Philip; and at the congress of Corinth, in the following year, he is appointed generalissimo of the Greek forces against Persia. But the hand of the assassin cut him off at a marriage-feast in Macedonia; and after an unsuccessful revolt against his son Alexander, the Greeks are compelled to bestow upon the youthful hero the same high military office with which they had intrusted his father. The events of Alexander's career are well known. From this time G. becomes an appanage of the Macedonian kingdom, until Macedon is in turn overcome by the Romans. During the wars which arose among the successors of Alexander, G. was always the bone of contention; she suffered in consequence many hardships, and enjoyed but few lulls of peace. The last struggle for Grecian liberty was made by the Achæan League (a confederacy of cities at one time embracing all Peloponnesus, which had a common object, a common council, and a common chief or *strategus*), but it too fell before the conquering arms of Rome; and after the capture of Corinth in 146 B.C. by the consul Mummius, the once mighty G. became a province of the Roman empire.

History (*Modern*).—The history of G. for some centuries after the capture of Corinth belongs to the history of her conqueror. The Roman wars with Antiochus, Mithridates, and others, involved G. in countless hardships; and the fierce struggles of Cæsar and Pompey, of Brutus and Cassius with Antony and Octavianus, of Antony and Octavianus, of which G. was often the theatre, entailed upon her many calamities. For nearly two centuries after the accession of Augustus, G. enjoyed comparative tranquillity, during which Christianity spread among her people, churches were founded, and many devoted Greeks went abroad to strange lands and perilled their lives in the propagation of the Gospel. But dark days again awaited her, and successive inroads of Slavonians, Albanians, and other barbarous hordes overran the country from the wintry plains of the north. When Constantine divided his empire, G. was attached to the eastern portion; but when, in 1204 A.D., the Venetian fleet under Dandolo overpowered the rickety throne of the Cæsars, G. too changed masters. The Osman Turks, who migrated to Europe in 1355 A.D.,

Digitized by Google

and made themselves masters of Thrace, Macedonia, Thessaly, and other parts, captured Constantinople in 1453 A.D.; and from that time until recent years, G. was subject to Mohammedan dominion. All the annoyances that ignorance, brutality, tyranny, and greed could suggest, were practised by the Turks on the much enduring Greeks, but at length human nature could no longer endure, and in 1820 broke out that rebellion against Turkish rule, which, by the bravery and determination of the Greeks, and the friendly countenance of Christian Europe, ended in the establishment of G. as an independent kingdom in 1829. Two unsuccessful attempts at rebellion had been made in 1770 and 1790. Capo d'Istrias, the first president of liberated G., was assassinated in 1831; and after several candidates for the throne of the infant kingdom had been proposed and rejected, Otho, second son of the king of Bavaria, was at length (1832) chosen by the three powers (Britain, France, Russia) which had assisted G. in her noble struggle. The reign of Otho was not a peaceful one, and he had very serious difficulties to contend with after he had assumed the reins of government in 1835. But his rule has not been altogether devoid of fruit; and law and order, industry and commerce, literature and notions of self-government, have made considerable strides within the last thirty years. On the banishment of Otho in 1862, the crown was offered to Prince Alfred of England. The agreement between the protecting powers, however, stood in the way of his election, and the present king, Georgias I., son of Christian IX. of Denmark, became king of the Hellenes in 1863.

Population.—The population of ancient G. at any one time it is quite impossible to approach; conjectures of the most wild and opposite kind have been hazarded, but it is useless to repeat them. Of modern G., the inhabitants numbered, in 1871, 1,457,894.

The Islands.—The islands of the Ægean Sea may be comprehended, as in ancient times, under two groups—the Cyclades and the Sporades. The former were so called from the legend of their *circling* round Delos, when that island was rendered stationary for the birth of Diana and Apollo. The latter receive their name from the circumstance of their being *scattered* or *sown* in an irregular manner round the coasts of the adjoining countries, and mostly belong to Turkey. The following list contains the islands belonging to G.: the first 20 are the Cyclades, the others, part of the Northern Sporades, lie off Eubœa. The Italian names are in parentheses. The Ionian Islands, formerly a republican dependency of Great Britain, were annexed to Greece in 1864.

1. Delos with Rhenea (Dili); 2. Syros (Syra); 3. Myconos (Mycono); 4. Tenos (Tino); 5. Naxos (Naxia); 6. Andros (Andro); 7. Ceos (Zea); 8. Cythnos (Thermia); 9. Seriphos (Serpho); 10. Siphnos (Siphanto); 11. Cimolos (Argentiera); 12. Melos (Milo); 13. Pholegandros (Policandro); 14. Sicinos (Sicino); 15. Ios (Nio); 16. Thera (Santorin); 17. Anaphe (Nanflo); 18. Amorgos (Amorgo); 19. Paros (Paro); 20. Olliaros or Antiparos (Antiparo); 21. Scyros (Scyro); 22. Sciathos (Sciatho); 23. Scopelos (Scopelo); 24. Icos (Chiliodromia). Besides these, there are many smaller islands and barren rocks, which belong to G., but which, from their unimportance scarce deserve mention. These islands possess many of the features which mark the mainland; the climate is varied; the soil is in one fruitful, in another barren; the productions are much the same as in G., except that in some of them, as Santorin, the vine grows in greater variety and luxuriance; the population is more primitive, and less mixed, and consequently retain more pertinaciously the customs of their forefathers. The islanders are generally more industrious and more happy than the continentals—the sea is their highway, and they can more easily get a market for the fruits of their industry. The islanders are excellent seamen, and a very large proportion of the males are employed in navigation. Delos is now little more than a barren rock; and scarce a vestige remains of the temple of the Sun-god, or other memorial of its former religious and commercial pre-eminence.

Syra (population 21,000) is the principal port of G., and a great centre of trade. The Mediterranean steamers call at it. Wine is almost the only production of the island.

The people of Tenos are famed for the manufacture of marble tables, chimney pieces, &c., which are largely exported, and the finest Malvasian or Malmsey wine is produced in the island. Of the other islands, the most volcanic is Thera; it pro-

Digitized by Google

duces in large quantity the wine called *Vino Santo*, or Santorin, of which the Russians are specially fond. Naxos is the largest and most beautiful and most fertile of the Cyclades. These islands comprise an area of rather more than 1000 square miles, and a population of (1871) 128,299 souls. The Cyclades are generally high and rocky in their coasts, and all are of a very similar aspect in this and other regards.

GREEK CHURCH, The, taken in its widest sense, comprehends all those Christians following the Greek or Greco-Slavonic rite, who receive the first seven general councils, but reject the authority of the Roman pontiff, and the later councils of the Western Church. The Greek Church calls itself "the Holy Orthodox Catholic and Apostolic Church," and it includes three distinct branches—the church within the Ottoman empire, subject directly to the patriarch of Constantinople; the church in the kingdom of Greece; and the Russo-Greek Church in the dominions of the czar. The last shall form the subject of a separate article, but it must also be alluded to in treating of the sister-churches. The proper history of the Greek Church as a separate body dates from the commencement of the Greek schism, or rather from the commencement of the efforts on the part of the church of Constantinople to establish for itself a distinct jurisdiction, and an independent headship in the eastern division of the empire. The ecclesiastical pre-eminence of Constantinople, it need hardly be said, followed upon the political distinction to which it rose as the seat of the imperial residence, and the centre of the imperial government. Originally, Byzantium was but a simple episcopal see, subject to the metropolitan of Heraclea; but the rank of the see rose with the fortunes of the city; and before the close of the 4th c., a canon of the first council of Constantinople, held in 381, assures to it, on the ground that "Constantinople is the new Rome," the "precedence of honor" next after the ancient Rome. This privilege, however, was purely honorary, and did not imply any pre-eminence of jurisdiction in the see of Constantinople, and there are many early instances in which questions arising within the district which afterwards became the patriarchate of Constantinople, nay, questions affecting the bishop himself, and even in his relations to the other patriarchs, were referred to the bishops of Rome. But the transition was not difficult, and was aided by the eminent qualities of some of the bishops, and especially of St John Chrysostom, so that in the council of Chalcedon (451), a decree was passed, which confirmed the precedence already given, and not only assigned to Constantinople an extensive range of jurisdiction, but also grounded these ecclesiastical privileges, in the case of the new as well as in that of the old Rome, upon the political precedence to which both successively had risen. The Roman legates protested against this canon, and the claim led to a misunderstanding between the two churches, which was widened and confirmed by the doctrinal differences which prevailed on the Eutychian question, in which the patriarchs of Constantinople gave their support to the *Henoticon*, a heterodox or equivocal formula put forth by the Emperor Zeno, which was warmly resisted in the West. The pope, in consequence, in 484, excommunicated the emperor, together with the patriarchs of Constinople and Alexandria; and thus the East and West were, *de facto*, separated for a period of nearly forty years. The terms upon which the excommunication was withdrawn by Pope Hormisdas in 519, involved a complete and explicit acknowledgment of the supremacy of the Roman pontiff; but the rivalry of Constantinople still subsisted. In the end of the 6th c., the Trullan Council (see TRULLAN COUNCIL) caused a renewal of the misunderstandings. Many circumstances combined to hasten a rupture; the title of "Ecumenical patriarch" claimed by the patriarch John the Faster, and reprobated by Gregory the Great (see GREGORY I.); the contests about image-worship, in which the patriarchs, in more than one instance, took the part of the Iconoclast emperors; the abandonment by the emperors of the defence of Italy against the Lombards; the gradual growth of an independent confederation of Italian states, and ultimately the foundation of a new empire of the West, the political antagonism of which with the eastern empire almost necessarily involved an antagonism of the churches themselves. Hence when, upon occasion of his own personal contest with the see of Rome, the deposed patriarch Photius (862), (see PHOTIUS) identified his cause with that of the Eastern Church, he found a ready sympathy among his countrymen. The Latin doctrine of the twofold procession of the Holy Ghost, and the addition of "Filoque" to the Latin creed, the Latin practice of clerical celibacy, and of denying to priests the power of adminis-

Digitized by Google

tering confirmation, supplied the grounds of quarrel; and although the Photian schism fell with its author, and the communion of the churches was restored, their reconciliation was imperfect and far from cordial. The same causes of controversy, with others of a disciplinary nature, were renewed in the 11th c.; and in 1054 the Pope Leo IX. issued a formal sentence of excommunication against the patriarch Michael Cerularius, which was solemnly published in Constantinople by the papal legates. Beyond the points of difference alleged by Photius, the most important of the new grounds of division was the use of unleavened bread by the Latins in the eucharist. Since that time, the separation has been perseveringly maintained. More than one attempt was made by the authorities upon either side to restore the former relations of the two churches, but in vain. The old antipathies of East and West became more inveterate by the separation; and the occupation of Constantinople by the Latins (1201), the outrages and atrocities by which it was disgraced, the establishment of the Latin kingdom at Constantinople; and the arbitrary tyranny by which it was maintained, widened still more the ancient estrangement. Nor was the breach healed by the re-establishment of the Greek empire (1261). The emperors, from political motives, pressed on all sides by the fears of foreign invasion and the embarrassments of domestic discontent, proposed, as the price of the assistance of the West in their necessity, the restoration of the Eastern Church to the obedience of Rome. Michael Paleologus (see MICHAEL PALEOLOGUS) by his ambassadors abjured the schism at the council of Lyons in 1274; and endeavored, by a synod held subsequently at Constantinople, to obtain a ratification of the union; but he failed to gain the assent of the body of bishops; and in the succeeding pontificate, the breach was even more seriously renewed, by two synods held at Constantinople, in 1283 and 1285. The necessities of John Paleologus compelled him once again to resort to the same expedient; and the negotiations for union were on this occasion conducted with much more deliberation. Delegates of the Greek Church, with the patriarch of Constantinople at their head, attended by the great Western Council (1437) of Ferrara (better known, from the place of its close, as that of Florence), and a protracted discussion took place, the chief points of which were the procession of the Holy Ghost from the Father and the Son, the addition of "Filioque" to the creed, the nature of the purgation of souls after death, the use of unleavened bread in the Eucharist, and the supremacy, by divine right, of the Roman pontiff. On all these points, the Greek delegates, with the exception of Mark, Bishop of Ephesus, subscribed the decree of the council; but this union was equally short-lived. On the return of the delegates to Constantinople, their proceedings were repudiated by the large body of the Greeks; and the downfall of the Greek empire and capture of Constantinople by the Turks in 1453, obliterated every trace of the attempted reconciliation. Since that time, some isolated bodies of Christians of the Greek rite have joined the church of Rome (see end of this article); but every attempt at a general union on the part of the Roman pontiffs has proved a failure. It has been the same with the attempts which have been made by the Protestant communions to establish an understanding with the Greek Church. Very early after the Reformation, a letter was addressed by Melancthon to the patriarch Joseph of Constantinople through a deacon, Demetrius Mysus, who visited Germany in the year 1558. Another Lutheran embassy of a more formal character, headed by the well-known Tübingen divines, Andreæ and Crusius, visited Constantinople during the patriarchate of Jeremias (1576—1581). But both missions were equally without result. In the following century, the celebrated Cyril Lucaris (see LUCARIS), who had been educated in the West, and had carried home with him a strong, though for a time carefully concealed bias towards Protestantism, opened the way for negotiations with the Calvinistic party. Soon after his elevation to the patriarchate, he issued a decidedly Calvinistical confession of faith (1629). But far from carrying his fellow-churchmen with him in the movement, the innovations which he attempted not only led to his own deposition and disgrace, but called forth a doctrinal declaration signed by the patriarchs of Constantinople, Alexandria, and Antioch, and many metropolitans and bishops, which, by the clearness and decision of its definitions, draws the line so markedly between the Greeks and reformers as to shut out all possibility of accommodation in matters of doctrine. This exposition was adopted by all the churches; and in a synod held in Jerusalem 1672, it was adopted as the creed of the Greek Church. This declara-

Digitized by Google

tion having been originally drawn up by Magilas, metropolitan of Kiew, it was published in 1722, by order of Peter the Great, as an authorised formulary of the Russian Church, under the title of "The Russian Catechism." With a few exceptions, to be specified hereafter, it coincides with the formularies of the Roman Catholic Church.

The Greek Church comprised within its ancient limits, anterior to the Mohammedan conquest, Greece properly so called, the Peloponnesus, Eastern Illyricum, the Islands, and Asia Minor, as also Syria and Palestine, Arabia, Egypt, and parts of Mesopotamia and Persia. But with the first triumph of the Koran, the church of Constantinople by degrees lost almost all her territory in Asia and Africa; and since the conquest of the Turks, it has sunk into the condition of a weak and oppressed dependant. By the separation of the Russian branch, partially in the 17th, and finally in the beginning of the 18th c., and by that of the new kingdom of Greece, on occasion of the revolution, its importance has been still more diminished. Each of the three divisions into which it has separated possesses a distinct organisation; but as the faith and practice of all are substantially identical, we shall first give a brief account of the doctrines of the Greek Church, especially in their relations to the Christian communions of the West, and to the controversies by which they are separated from each other.

In general, it may be inferred from the fact that the Greek Church receives the first seven councils, that on all the controversies regarding the Trinity and Incarnation the Greeks are agreed with the Western Catholics, with the sole exception of the double procession of the Holy Ghost, in which they are at issue not only with Catholics, but it may be said with the entire body of Western Trinitarians. While they reject the papal claim to supremacy and doctrinal authority, they agree with Catholics in accepting as the rule of faith not alone the Bible, including the Deuterocanonical books (see Synod of Jerusalem in Harduin's "Coll. Concil.," xi. col. 258), but also the traditions of the church, that is, what are believed to be the unwritten revelations of our Lord and of the apostles, preserved by the testimony of the Fathers, among whom they regard with special veneration Basil, Gregory of Nazianzum, and Chrysostom. They admit the seven sacraments as received by the Roman Church—viz., Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony; but in the rites used by them in the administration of these sacraments there are considerable discrepancies from the Latin rite. They administer baptism by a triple immersion; confirmation is administered in immediate connection with baptism, even in the case of infants, and it is administered by priests, and not, as among the Latins, by bishops exclusively. As to the eucharist, the Greeks admit the real presence of Christ, the transubstantiation of the elements, the propitiatory sacrifice, and (although this has been denied by Protestants) the adoration of the host (see Renaudot, "Liturg. Collectio," i. pp. 22, 23). But they differ from Catholics in the use of leavened bread, in administering the communion in both kinds, and in administering it in this form even to children. In the sacrament of penance, they recognise, like the Western Catholics, auricular confession, priestly absolution, and penitential works; and although they differ from the Latins as to the use of indulgences, they admit the principle upon which their use is founded, and even their applicability to the dead. The peculiarities of their use of extreme unction have been already detailed. See EXTREME UNCTION. In the sacrament of holy orders, they have many peculiar observances. See ORDERS, HOLY. The most striking point of difference regards clerical celibacy. The Greek Church recognises the excellence of virginity, and the fitness of its observance by those engaged in the ministry, so far as to prohibit marriage altogether to bishops (who are always chosen, in consequence, from the monastic, and not the secular clergy); to forbid priests or deacons to contract marriage after ordination; to forbid to all, without exception, a second marriage, or marriage with a widow; and to require of married priests that they shall live separate from their wives during the time when they are actually engaged in church services. But they not only permit married candidates to be advanced to deaconship and priesthood, but even require as a general rule, that they shall be actually married before they can be admitted to orders. While admitting marriage to be a sacrament, they hold it to be dissoluble in case of adultery, and they regard fourth marriages as utterly unlawful. On the condition

Digitized by Google

of souls after death, they do not admit with Western Catholics a purgatorial fire, but they admit the principle of the intermediate state of purgation, and of the practice of prayer for the dead. They also admit the intercession of saints and the lawfulness of invoking them, especially the Holy Virgin Mary, and of honoring their shrines and relics. They do not permit the use of graven images, with the exception of that of the cross; but they freely receive and pray before pictures, which they hold in high honor, and on which they lavish the most costly ornaments of gold, jewels, and other precious things. In their belief of the merit of good works, and especially of fasting, they go even further than Roman Catholics. Besides four yearly fasts—the forty days of Lent, from Pentecost to the Feast of Saints Peter and Paul, the fifteen days before Assumption day, and the six weeks before Christmas—they observe the Wednesdays and Fridays throughout the year as fasts. Their liturgy shall be described hereafter (see LITURGY); for the present, it will be enough to say that, in splendor of ceremonial, they are not inferior to the Westerns. Instrumental music, it is true, is forbidden in the churches, but singing is universally in use. In public prayer, the kneeling posture is used only at Pentecost; at ordinary times they stand, the body being turned towards the east. The use of the sign of the cross is habitual among them. The monastic institute has subsisted in the Greek Church from the earliest times, and numerous convents of both sexes are dispersed over the east, which follow almost exclusively the rule of St Basil. The abbot is called Hegumenos, the abbess, Hegumené; if several convents be subject to a single abbot, he is called Archimandrite. Both monks and nuns are bound by vows of celibacy. With both the duty of manual labor is a leading observance; the nuns, like their Western sisters, apply themselves to the care of the sick and to the education of young females.

As regards the separate constitution of the three great sections of the Greek Church, it will be enough to say that the church in the Turkish empire has remained subject to the patriarch of Constantinople, who from the beginning enjoyed a continued but precarious protection from the sultan, and even held, as regarded his own flock, a civil pre-eminence, with the rank of a "pasha of three tails." But in return for this civil status, the Porte claimed the right of appointing and also of deposing the patriarch, a right which was habitually exercised as a matter of purchase and sale, and which led to the grossest simony, not only as to the patriarchate, but in the entire ecclesiastical system. Formerly, the metropolitan of Russia (afterwards patriarch) was subject to the patriarch of Constantinople, as also the bishops of the modern kingdom of Greece; but both churches are now independent of Constantinople. The patriarch of Constantinople, Jeremias II., in the year 1589, consented to the creation of a separate but dependent patriarch; and this dependence continued until the time of Peter the Great, by whom the patriarchate was first suspended and afterwards abolished, the Russian church being now governed by what is called the Holy Synod, an ecclesiastical commission appointed by the czar. The independence of the church of the kingdom of Greece dates from the revolution. The "organic law of Epidaurus," of January 1822, proclaimed the Oriental Orthodox Church as the church of the state, and soon afterwards measures were taken to organise this church in the new kingdom. For a time, the patriarch of Constantinople hoped to preserve his ancient authority; but the president of the new state, Capo d'Istrias, firmly resisted, and, after many preliminaries, the new church was formally organised by a decree of July 15 (27), 1833, on a plan in great part borrowed from the constitution of the Russian Church, as settled by Peter the Great. The governing body in the church of the kingdom of Greece is, as in the Russian, the so-called "Holy Synod," which consists of five members, who are ordinarily archbishops or bishops, but may also admit into their number one or two priests or monks. This synod is the supreme ecclesiastical tribunal, and in name at least is independent in spirituals; but as its members are all named by the crown, and hold office but for a year, it is practically a state instrument; moreover, two officials of the crown have a right to assist, although without a vote, at all its deliberations. The synod elects bishops, but the crown has the right of confirming and granting investiture. To it also belongs the power of regulating the limits of dioceses, and all such general arrangements. The last remnant of subjection to Constantinople was removed by a formal recognition of independence in 1868, and the bishops no longer seek consecration from the pa-

Digitized by Google

triarch of that see. In 1869, a correspondence took place between the archbishop of Canterbury and the patriarch, with a view to the union of the Anglican and Eastern churches. In the same year the government of Russia abolished the hereditary character of the Russo-Greek priesthood. The Russo-Greek church is believed to number about 55,000,000. The church of Greece comprehends a district of about 886 sq. m., and numbers about 800,000 members.

THE UNITED GREEK CHURCH comprehends those Christians who, while they follow the Greek rite, observe the general discipline of the Greek Church, and make use of the Greek liturgy, are yet united with the Church of Rome, admitting the double procession of the Spirit and the supremacy of the Roman pontiff, and accepting all the doctrinal decisions subsequent to the Greek schism which have force as articles of faith in the Roman Church. The United Greeks are found chiefly in Southern Italy, in the Austrian dominion, in Poland, and in the Russian empire. In Italy, they are computed at 80,000; in Austria, at about 4,000,000; and in Poland, about 250,000. In Russia, it is difficult to ascertain their number. It has fallen off considerably in late years. In Austria, they are divided into Romanians and Ruthenians—the former being settled in Wallachia, Transylvania, and Eastern Hungary; the latter, in Little Russia, Galicia, and North-eastern Hungary. The union of the Greek Christians of Wallachia and Transylvania dates from the end of the 12th c.; and although the Reformation made some progress among them, they still for the most part remain true to the union. The union of the Galician Greeks or Ruthenians is of much later date, about the close of the 17th century. It is only necessary to add that the usage of the United Greek Church as to the law of celibacy is, with the consent of the Roman pontiffs, the same as among the other Greeks. They are also permitted to administer communion under both kinds.

GREEK-FIRE, a composition supposed to have been of nitre, sulphur, and naphtha as a principal ingredient, with which the Greeks of the Byzantine empire were wont to defend themselves against their Saracen adversaries. The accounts of its effects are so mingled with obvious fable, that it is difficult to arrive at any just conclusion as to its power; but the mixture appears to have been highly inflammable, and to have possessed the power of burning under water. It was projected either on blazing tow, tied to arrows, or through a tube, the precursor of cannon. Wherever the combustible fell, it made great havoc, from the inextinguishable nature of the fire. The invention of this material has usually been ascribed to Callinicus of Heliopolis, and the year 668 A.D.; but there seems to be reason to believe that it was rather imported from India. At Constantinople, the process of making Greek-fire was kept a profound secret for several centuries. The knowledge, however, of its composition gradually spread; and at the time of the discovery of gunpowder, Greek-fire formed a recognised defensive element in most wars from Western Europe to Asia Minor. Subsisting for some time concurrently with gunpowder, it gradually died out before the advances of that still more effective competitor, till now little vestige remains of Greek-fire beyond a Norman corruption of its name in our firework "cracker," which, derived from "Creyke" of the middle ages, is but a corruption of "Grecque." See also FIREARMS.

GREEK MUSIC. The existence of music as an art or science among the ancient Greeks has for hundreds of years been a subject of inquiry and discussion among the learned. With the restoration of the arts and sciences at the end of the middle ages, the veneration for all that belonged to that people was carried to such an extent, that because we had to thank them for much, many writers thought we must be obliged to them for all. Fortunately, we have handed down to us various dissertations and fragments on music by old writers, which, although they do not unfold to us anything like a satisfactory view of the ancient Greek music, yet suffice to shew us that among the ancient Greeks the art of music was in a very imperfect and incomplete state, and that, in its elements and groundwork, it was entirely a slave to poetry, and can have been little else than a kind of intoned declamation. We hear from ancient writers of the magic influence of music; but we must not forget that they used the word music in a collective sense for the gift of the muses generally; and when they spoke of the elevating and moral effects of music, it is to be understood that they meant a general harmonious cultivation of the arts and sciences. The system of music known to the ancient Greeks, and as practised in their temples and theatres, differed essentially from our modern music, as their scale or succession

Digitized by Google

of sounds, was not based on the octave and its repetition, but on a fourth and its repetition. Their scale consisted of five tetrachords, each containing four consecutive sounds; the last sound of one tetrachord being always the first of the next; while two of their tetrachords had more than one sound in common. In modern music, the ancient Greek scale would be as follows: B, C, D, E; E, F, G, A; A. B flat, C, D, &c. This they called the diatonic genus. They had also their chromatic genus, thus, B, C, D sharp, E; E, F, G sharp, A, &c.; and their enharmonic genus, the tetrachords of which consisted of two quarter-tones (which cannot be expressed in modern music) and a major third. It is beyond a doubt that the ancient Greeks neither possessed a system of notation by which their music, such as it was, might have been preserved, nor had they any idea of harmony in the modern sense of the word. Many believe it impossible that a people who have left us specimens of their poetry and sculpture, which, after 2000 years, are still admired as masterworks, could have been content with such an imperfect and clumsy system of music. Had it been otherwise, it is scarcely possible to imagine that the knowledge of it would not have been handed down to us. An ode by Pindar, and a hymn or two set in modern notation from an old Greek MS., is the whole we possess of ancient Greek music, and those are said by many to be spurious.

GREEK PHILOSOPHY. See PHILOSOPHY.

GREEK RELIGION (Ancient), the most poetical and most humane of polytheisms, presents itself in historical times as a plastic worship of nature, with its visible objects and its invisible powers; of abstract notions, sensations, propensities, and actions; of tutelary Numina, household or family gods; and of exalted men or heroes. Composed of such widely discordant elements, this great Hellenic Pantheon offers yet a unity so harmonious and consistent in its minutest parts, that its origin is even more difficult to trace than that of the people itself, which, from a conglomeration of heterogeneous races and tribes was fused in an incredibly short space of time into one great family of equal propensities and of equal gifts. This question of the origin of the Greek religion has indeed been a point at issue from the time of Herodotus to our own. While he, together with many others, pronounced it to be almost completely an importation from Egypt, a strong autochthonic school held it to be homesprung; and these two antagonistic views—the East and Hellas—have, in a more or less modified form, found their foremost representatives in modern days, in Creuzer on the one side, and Otfried Müller on the other. The new and all-important science of Comparative Mythology, however, may be said to have set this point at rest; for it proves almost to demonstration, that the fundamental ideas of the Greek religion are due to the regions north-west of India, the cradle of the main Hellenic stock (see ARYAN RACE); while subsequent colonists introduced additional gods from Phœnicia, Egypt, and other parts of the East. All these, with the host of personified fancies and ideals begotten by the poets at home, were soon amalgamated into one great system. Yet those foreign elements, so far from detracting from the originality of the Greeks, shew in a still stronger light what brilliancy of conception and power of imagination, what harmony and plasticity, had fallen to the share of the inhabitants of Hellas; a land which in itself, by the immense variety of glorious scenery of sea and sky, wood and mountain, river and bay, rock and island, contributed not a little to quicken that immortal youthfulness by which they were so aptly and strikingly called throughout the East the people of Yavan (Sanscr. *Yavan* = *Juvenis* = *Young*). The gods, from the moment they touched these shores, from dead symbols became living realities, with all the qualities and sensations, aims and actions, of a living individuality, and that of the highest, most noble, and divine frame existing—man. Anthropomorphism, indeed, is the chief characteristic of Greek religion. The brute creation—which to the East was something to be exalted, and to be adopted as the type of divinity—furnished the Greeks only with a few attributes for their humanly shaped gods. But man, the ideal of creation, was deficient in one thing:—the duration of his life was limited—and in this the gods differed from him: they were immortal. In all other respects, they were like himself: they loved and hated, they "transgressed" and suffered. No ideal moral code existed with the Greeks, the first essentially ethical people though they are; consequently, their gods, when they could not attain the objects of their many and strong desires in a straightforward manner, had unscrupulous recourse to stratagem and cunning, and

Digitized by Google

through their questionable practices, not unfrequently brought themselves into very undignified positions. And yet the influence of such unworthy conceptions of the gods was not so detrimental to the believer as at first sight might be supposed; for the Greek deities were not to be patterns for humanity: they were, through their mighty origin, their almost unbounded powers, and their immortality, exempt from the ordinary laws which must rule the dealings in the commonwealth of low, weak, dying humanity. They were a kind of exalted aristocracy, who could not be judged by a human standard, much less be imitated by human beings; and, after all, even they had to submit to a supreme fate (*Moira*), which found out their guilt, and punished it. The mortal, however, was subject to them individually; and it was his special province to fulfil the duties of piety and modesty towards them, of righteousness and justice towards his equals. On this condition alone, the undisturbed enjoyment of life with all its most glorious gifts was his. Retribution for evil doings followed, with rare exceptions, speedily and irrevocably, on the earth he trod, not at some future period or in other realms. There was a hereafter, but it was a shadowy thing without life and blood, a miserable nether world of cheerless twilight. Only for very extraordinary crimes was there something like a real, fearful, and everlasting punishment in store in the Hades, or the still more terrible Tartarus; while, on the other hand, only the most exalted heroes are, after their death, endowed with a new body and enjoy the pleasures of Elysium. But these are very exceptional cases: "When a man is dead," says the shade of Anticlea, "the flesh and the bones are left to be consumed by the flames, but the soul passes away like a dream."

We cannot attempt here to enter minutely into this vast subject of Greek theology—to trace its historical development from the days when the early Pelasgians invoked, like their Persian and German kinsmen, the highest god without image or temple, and the minor deities as the "Great Ones," the "Unknown Ones," the "Merciful Ones," without distinct name and shape—to the time when every sound and every sight, every thought and every deed, had a sublime significance, caused and inspired as it was by a god; when the prodigious number of clearly defined and individually and most sumptuously worshipped gods formed one of the mightiest impulses to the development of the arts: and from that period down to the days when the poets put prophecies of the speedy death of the gods into the mouths of their heroes; when philosophers openly declared "these things to be fancies and dreams," and religious persecutions hastened the downfall of a creed which had become adulterated by foreign elements no longer to be amalgamated—until Christianity stepped in, and not satisfied with deposing the gods of Greece, sent them, branded with the names of "evil powers," or "demons," in the sense of Eastern "Satans," to perdition. Much less can we attempt here a minute enumeration and description of all the deities, their genesis and history, with the myths and legends, traditional or invented in historical times by poets and philosophers, or dwell on the immense influence of Greek religion on other religions, the Christian among them. It is only desirable here to trace a faint outline of the divine commonwealth, and the outward forms of the religious worship of the Greeks, in the so-called classical period. Some account of the principal deities will be found in special articles.

Without entering into the principal division of the gods into heavenly, terrestrial, and maritime, we will briefly mention the supreme council of the twelve national gods, who, together with a vast male and female retinue, dwelt on the heights of Mount Olympus, around its highest peak. This, reaching into the sky (Ouranos), was inhabited by Zeus, the son of Chronos, the highest, mightiest, and wisest being, king and father of gods and men; who watches over all human doings, principally over hospitality and the sacredness of oaths. Second in power is his brother Poseidon, the shaker of the earth, the ruler of the sea and all the waters of the earth. Next stands Apollo, the son of Zeus and Selo (darkness); he is (as Phoibos) the sun, and darts his rays or arrows as god of the chase, as god of destruction, as well as of beneficence. But he is not god only of the physical, but also of the mental light; hence to him belongs the insight into future events. He is the god of oracles, but, as such, equivocal (*loxias*); further, god of poetical inspiration, song, and music—leader of the muses. He is one of the sublimest figures among the gods. In his love and in his hatred, he is always enshrouded in a sacred dignity and majesty, of which even the most ribald fiction stood in awe. The god of the terrestrial

Digitized by Google

fire, which in his person had been thrown from heaven to earth, is Hephæstus. His workshops are volcanoes, where metals are forged or wrought by him into artful forms; and as volcanic soil best matures wine, to him was assigned the office of cupbearer of the gods. Ares presides over war. Battles, slaughter, rapine, and the doom of cities are his delight. Hermes—originally, perhaps, the symbol of animal generation—appears as patron of the herds. He is the guardian of the roads and the messenger of the gods; he is, moreover, the inventor of the lyre and gymnastics. He is the presiding genius of commerce, and, as such, a knave, even a thief. With Zeus is coupled Hera, his sister and wife—beautiful, majestic, but exacting and quarrelsome. The foremost daughter of Zeus, and who sprang from his head in full armor, is Athene, who stands in a twofold relation to the light, physical as well as mental—whence she becomes the goddess of understanding and wisdom—and to the water (*Tritogeneia*); hence also her rivalry with Poseidon. The two elements, the warm and the moist, giving rise to the fertility of the earth, she is the goddess of the grain and of the crops; she is likewise goddess of war, and presides over female handiwork. Artemis, the twin-sister of Apollo, shares with him the chase and the light; her attributes are a torch and the moon. The Phœnician goddess Astarte had risen from the foamy waves on the Greek shores as Aphrodite, the Greek goddess of beauty, of love, of voluptuousness. Her counterpart was the chaste maiden-goddess Hestia, in whom was personified the hearth as the centre of the house and family. From the everlasting fire on her altar, the colonists took the flame which was to accompany them to their new settlements. The list of the Olympians closes with Demeter or Gaia. She is the goddess of agriculture, and, consequently, of settled institutions and laws.

An indefinite number of other gods followed, some of them little inferior in power and dignity to the twelve, and who sometimes, like Dionysus, the god of goat-herds and wine-growers, and others, acted as the special deities of certain classes. We may mention here Hades, Helios, Hecate, Leto, Dione, Persephone, Themis, Eos; the Charites, the Muses, the Moeræ, Proteus, the Nymphs, and other *daimons*—partly primeval local deities, partly deified powers of nature; river, mountain, and forest gods; or personified abstract notions—such as Tyche, Psyche, Hebe, Thanatos, Phobos, Hypnos, Kratos, Bia, and the like conscious or unconscious allegories. Besides these, they is a mob of deities, or rather monsters, begotten by gods—the Harpies, the Gorgons, Pegasus, Chimæra, Cerberus, Scylla and Charybdis, the Centaurs, the Sphinx, &c.

A palpable link between gods and man is found in the heroes or demigods—i. e., men deified after death—a race sprung from the embraces of gods and the beautiful daughters of man. They became either, like Heracles (the Phœnician Melkarth), founders of races, who were thus considered the sons of gods, or patrons of special trades and professions, like Dædalus, the *heros* of artificers and others. The entire absence of that dark and terrible, essentially Eastern, notion of an evil principle, co-existent with the good, between which two rival powers the world is divided; the undaunted geniality of the Greek nature; the tendency towards humanising the whole universe and its gods, who, again, had not disdained to ally themselves with mankind; and above all, the emancipation from an all-ruling hierarchy such as swayed the East, made the Greek religion dogmatically, as well as practically, one of the brightest and most joyous, no less than the mildest and most tolerant, of ancient creeds. The outward as well as the inward worship of the gods was with them purely a personal affair. No mediator stood between the individual and the deity; every freeborn man, woman, and child had the undisputed right to pray and to sacrifice when and where the heart prompted. The only office of the priests consisted in the care of certain sacred property, in providing for the service of the temple, in the performance of certain traditional rites, the recitation of certain ancient formulas handed down in the priestly families, and the expounding of the Divine Will expressed by oracles. The Sacrifices (q. v.), which in earlier days had consisted in the votive offering of a lock, a garland, a tablet, or such simple fruits as were yielded by the soil, gradually, as hills and groves no longer sufficed, and temples, stately and sumptuous, adorned with gorgeous statues, had been erected, grew into splendid feasts, of which the gods were invited to partake, together with those who sacrificed. Of the periodical festivals held in honor of special deities, the games and sports, the scenic representations and musical contests connected with them

Digitized by Google

and of their peculiar influence in raising the literature, arts, and philosophy of the Greeks above that of all mankind, we have spoken under FESTIVALS, and we may further refer for particulars to such articles as DIONYSIA, PANATHENEIA, THESMOPHORIA, ELEUSINIAN MYSTERIES (where also the subject of the Mysteries is touched upon), as also to the headings OLYMPIAN, PYTHIAN, NEMEAN, and other GAMES.

One of the most characteristic provinces of the Greek cult was that belonging to the mantics or diviners. The Greek, looking upon the gods as his omnipresent friends, who were anxious to caution him against threatening dangers, or, in other words, firmly convinced by his own strong sympathy with nature, that a derangement of his own affairs, however unknown to himself, must produce a corresponding derangement in nature, could not but give some credence to the foreboding significance of natural or "supernatural" prodigies or signs. The ether or space between heaven and earth, would be the principal scene of these revelations; the storms that swept through it, the thunder that rolled around it, and the birds that floated in the blue abyss, were all so many divine omens. No less would the gods speak in the offerings immediately addressed to them—in the innermost entrails of the sacrificial animal—in the flame that rose from their altar—in dreams of the night, and strange sounds and portents by day: thus, if in the midst of the assembled people, an ominous animal appeared, they speedily dispersed. Yet the free and clear Greek mind could hardly be suspected to have more than tolerated such practices, much less could it be supposed that it ever sank to the low level of grovelling imbecility, as was the case in this matter of augury with the Etruscans (q. v.); and Homer—though to the astonishment of Xenophon—puts into the mouth of Hector the momentous words: "One omen only is significant—to fight for one's country!"

The growth of culture did indeed early free the Greeks from the vague awe of everyday phenomena, and the science of manticism fell accordingly into the hands of the lowest jugglers and soothsayers, believed in only by the herd. But in the same degree, there rose into highest importance another and exalted kind of prophecy—the Oracles (q. v.). In this, the god Jupiter—afterwards principally Apollo, his son, the partaker in his counsels—spoke himself: first, in the rustling of leaves, in the clangor of brass basins, later, in distinct human words. He chose the weakest vessels—women, girls, to whom the divine gift was a burden and a pain. The Sibyl herself does not understand what the god says through her mouth; she is unconscious—in a state of somnambulism—of mania. But here the priests step in; they act as interpreters, as prophets, as *Evangelides* (the progeny of some *Evangelos*), "bringers of good tidings." Their influence, socially and politically, increased with that of the oracles themselves, especially when these latter, by degrees, from being casual and unforeseen, became frequent and regular. The richest gifts poured in from all parts, as it grew matter of piety to have recourse to them as means of grace. They thus rose into an institution, the importance of which, principally for the unity and consequent rise of Greece as a political power, cannot well be overrated. Besides the oldest oracle—that of Jupiter at Dodona—we may mention, out of the 260 which were counted throughout Greece, those of Didyma, Delos, Abæ, Klaros, Larissa, Tegyra, of Trophonius—in a subterranean cavern—and of Amphiarens, near Oropus, in Attica, where the answers were revealed in dreams. But by far the most famous, and of highest import for the whole nation as such, was that of Delphi (q. v.), where the Amphictyonic council was held; where everything connected with the public worship throughout the country was settled; where the calendar itself was regulated; where, in fact, for a very long time was the real central power of Greece.—Its voice ceased under Julian the Apostate.

GREELEY, Horace, American journalist, was born at Amherst, New Hampshire, February 3, 1811. His father was a farmer of small means; and Horace, after acquiring the rudiments of education at a common school, entered a printing-office as an apprentice, 1825, at Putney, Vermont. On the completion of his apprenticeship, he worked for some time as a journeyman printer, and in 1834 commenced the "New Yorker," a literary weekly paper, for which he wrote essays, poetry, and other articles. After one or two other essays at editorship, he began in 1841 the "New York Tribune," of which he has ever since been the leading editor. As Mr G. had adopted, to some extent, the social theories of Fourier, he was joined by the most able writers of that school of Socialism, and the paper is published as a joint-

Digitized by Google

stock concern, being held in shares by its writers and others engaged in its publication. The "Tribune" has also been an earnest advocate of temperance, woman's rights, the abolition of slavery and capital punishment, and other reforms, and is recognised as the organ of the extreme or radical Republican party. In 1848, Mr G. was elected to congress from one of the districts of New York, for the short term, but failed in his congressional career by agitating an unwelcome reform in the mileage payments to members. In 1851 he visited Europe, and was chairman of one of the committees of the Great Exhibition. His aspirations to political position were defeated by the more conservative party leaders, and he, in turn, is supposed to have secured the election of Mr Lincoln, instead of Mr Seward, in 1860. On the secession of the southern states from the Union, Mr G. at first advocated their right to secede, in accordance with the principles of the Declaration of Independence; but when the war began, he became one of its most zealous advocates, and is supposed to have caused the premature advance that resulted in the defeat of Bull's Run, July 21, 1861. In 1872, he was an unsuccessful candidate for the presidentship, and died the same year.

GREE'NBACKS. During the Civil War in America from 1861 to 1865, the immense expenditure of the United States government led to the printing of an unprecedented number of bank-notes, bonds, and currency papers of various kinds. These documents, from the color presented by them, or some of them, obtained the name of *greenbacks*, a designation which became almost as familiarly used in Congress as among the general public. At first, the manufacture of these notes taxed the resources of the government in a very embarrassing way; and there was ample reason to suspect that forged notes and bonds were abundantly in circulation; but, by degrees, a fine and large establishment was organised at Washington, under the immediate control of the Secretary to the Treasury. In this establishment, everything was conducted from first to last; rags, fibres, plates of steel, and colors were taken in, and finished notes were sent out. It was only under very rare circumstances that strangers were admitted to view the operations; but one such occasion, in 1864, led to a general description of the place being given in most of the newspapers, from which it was copied into some of the English scientific journals.

Speaking of the establishment as it was in 1864, and not touching upon any of the modifications which may since have been introduced, there were distinct and separate departments for mechanical repairs, paper-making, ink-making, paper-wetting, plate-engraving, printing, numbering and denominating, and cutting. In the paper-mill, all the paper for the greenbacks was made, with a degree of scrupulous attention and uniformity that cannot always be insured in a private establishment. It was necessary to have a paper that would wear well, would not split easily, and would be sufficiently non-photographic to baffle a forger. Dr. Gwynn made many experiments, with a view to attain excellence on these points; and at length he produced a kind of paper nearly as strong as parchment and as smooth as satin. The nature of the material was known only to himself and the government. There was a fibre in the paper, quite moulded or felted into its substance, which could not be photographed without discoloring the sheet to which it was transferred, giving it the appearance of a coarse, black, spider-web, which would instantly have betrayed the forgery. In another department, the ink was made by means of grinding-machines, one for each of the several colors used in the various kinds of notes and bonds. While these operations of paper-making and ink-making were in progress, the engraving of the plates was conducted in another department. The steel-plates were engraved with the most minute and intricate devices which the hand and the eye of the artist could execute: it mattered little what device was selected, provided it were difficult for a forger to imitate. One particular note was, in its main features, an engraved copy of a picture in the rotunda of the Capitol at Washington; and the engraving is said to have occupied a whole year to execute. All the devices, of whatever kind, were made to co-operate with delicate water-lines in the paper, to render forgery difficult. As the plates were costly to engrave, and fitted to yield only a certain (though large) number of impressions each, a mode of multiplication was adopted which had for many years been largely used in England. The processes were thus connected: 1. The engraver executed the design on a smooth plate of soft steel. 2. The plate was hardened by well-known processes of heating and

Digitized by Google

coling. 3. A roller of soft steel was pressed with immense force over the hardened plate, and took upon its surface the device *in relief*: as the roller was equal in length to the length of the plate, and equal in circumference to its breadth, the curved surface exactly took in the whole of the device. 4. The roller was hardened. 5. The hardened roller was used as a matrix to produce any number of plates in soft steel, which had the device in *intaglio*, like the original plate. 6. These plates, when hardened, were used to print from.

The paper, the ink, and the plates being thus prepared, all was ready for the printing. In the earlier period of the working of the establishment, presses were used such as are generally employed by copper-plate printers; each press attended by a woman to place and remove the paper, and a man to manage the inking and the pressure; but afterwards, a large room was filled with hydraulic printing-presses, which conducted the operations much more rapidly. The notes, as fast as printed, were interleaved with sheets of thin brown paper, to prevent blurring. In numbering and denominating the notes, a yellow mordant was employed, of such kind that the note could not be photographed without producing a black impression from the yellow portion. The numbering-machine was worked by a treadle; there were six discs with figures on their edges, and they so acted on each other by means of ratchets, that they could print any number from 1 to 999,999. For consecutive numbering, the machine adjusted its own figures after each printing. The notes were usually printed four on a sheet, and were afterwards severed and trimmed by a cutting-machine, which made them all precisely equal in size and shape. So complete was the check established in all the operations, that "not even a blank sheet," said a narrator, "much less a printed one, is passed from one hand to another without being counted and receipted for; and unless there is collusion from one to another in every process through which the paper has to pass before it is finished, there cannot be an over-issue. The paper is issued from one room, and is re-issued from that room sixteen or eighteen times before it is put into circulation; being counted, charged, and receipted for each time, and recounted, recharged, and re-receipted for through each process that it passes after leaving that room." For the English system, see BANK-NOTES.

GREEN CLOTH, Board of; a board connected with the royal household, consisting of the lord steward and inferior officers, which has power to correct offenders within the verge of the palace, and two hundred yards beyond the gates. A warrant must be obtained from this board to enable a servant of the palace to be arrested for debt.

GREEN COLORS. Although every shade of green can be produced both in oil and water colors, and also in dyeing, most of them are made by mixing the various yellow and blue materials in different proportions. The following are the green paints in use:

Arsenical green, or Scheele's green, is an arsenite of copper, made by dissolving arsenious acid in a solution of potash, and adding it to a solution of sulphate of copper. A precipitate is formed, which is *Scheele's green*, or *Mitis green*.

Brunswick green.—The best is crude oxychloride of copper, but the kind commonly sold is a mixture of carbonate of copper and chalk, or pipe-clay. One shade of this mixture is sometimes called *Bremen green*.

Chrome green is a mixture of Prussian blue and chrome yellow.

Copper green is sometimes a natural product, but is more generally manufactured; it is the oxide or the carbonate of copper, and is sometimes called *green bice*, or *mountain green*.

Emerald green is an arsenite of copper, prepared by a slightly different process to *Scheele's green*.

Fries or *Friesland green* is made with sulphate of copper and sal ammoniac.

Gellart's or *Gellert's green* is a mixture of *cobalt blue*, flowers of zinc, and *chrome yellow*.

Sap green—the juice of buckthorn-berries fermented for seven or eight days, after which a little alum is added; and when evaporated to a thick consistency, it is pressed into bladders, and hung up until entirely dry. It is chiefly employed in water-colors.

Digitized by Google

Schweinfurth green is another form of the arsenite of copper produced by dissolving separately equal parts of acetate of copper and arsenious acid. The solutions are then added together quite hot, and the precipitate formed is the beautiful but highly dangerous pigment. Its great beauty has led to its frequent employment in coloring wall-papers, artificial flowers, and even in some cases, it is to be feared, in coloring sugar confections.

All of these colors, with the exception of sap green, are dangerously poisonous.

Green, in dyeing, is always understood to be a mixture of the two colors blue and yellow. The materials are generally mixed first with blue, and afterwards with yellow, proportioning the intensity of each to the shade of color required.

The Chinese have a vegetable green color called *luh-kao*, or green indigo, but it is exceedingly costly, and it is only obtainable in very small quantities.

GREEN EARTH, a mineral of a green color and earthy character, often found filling the cavities of amygdaloid, or incrusting agates in that rock, sometimes also massive or disseminated, chiefly in trap rocks. It consists principally of silica, alumina, and protoxide of iron, the silica constituting about one half. It is used as a pigment by painters in water-colors, who know it by the name of *Mountain Green*. For their use, it is mostly brought from Monte Boldo, near Verona, and from Cyprus. In New Jersey, green earth is used as a manure, and is said to be very beneficial.

GREEN EBONY, a dyewood imported in considerable quantities into Britain from South America. It is the wood of the *Jacaranda ovalifolia*, a tree of the natural order *Bignoniaceæ*. It yields olive-green, brown, and yellow colors. It is generally imported in pieces about three feet in length; it is a hard wood of an olive-green color, and is sometimes used for purposes of carpentry and by turners. The tree has showy, panicled flowers.

GREENE, Nathanael, an American revolutionary general, born May 27, 1742, at Potowhommet, Warwick county, Rhode Island. His father was a leading preacher among the Quakers, and educated his son very simply, training him from childhood to work on his farm, and at his anchor-forge and grist-mill. By his own perseverance, however, he acquired considerable knowledge of ancient and English history, geometry, law, and moral and political science; he was also fond of reading books upon war. In 1770, he was chosen a member of the Rhode Island Assembly, and, to the great scandal of his fellow Quakers, was among the first to engage in the military exercises preparatory to resisting the mother-country. In 1774, he enlisted as private, and in 1775 was appointed to the command of the Rhode Island contingent to the army at Boston, with the rank of brigadier-general. He was promoted to be major-general in 1775, and distinguished himself at the engagements of Trenton and Princeton. At the battle of Brandywine, he commanded a division, and by his skilful movements saved the American army from utter destruction; and at Germantown he commanded the left wing. In 1778, he accepted the office of quarter-master-general. In 1780, he succeeded Gates (q. v.) in the command of the army of the South. Gates had just been completely defeated by Cornwallis, and G. found the army in a wretched state, without discipline, clothing, arms, or spirit. By dint of great activity, he got his army into better condition, and remained on the defensive for the remainder of the year. In 1781, he had a successful skirmish with an English detachment, but drawing upon himself the whole army of Cornwallis, much his superior in numbers, he made a masterly and successful retreat. With 5000 new recruits, he entered upon more active operations, and finally defeated the English at Eutaw Springs, the hardest fought field of the revolution, which put an end to the war in South Carolina. Congress struck, and presented to him, a medal in honor of this battle, and the Carolinas and Georgia made him valuable grants of land. When peace was restored in 1783, G. returned to Rhode Island, where he received numerous testimonials of the public admiration. In 1785, he retired with his family to his estate in Georgia, where he died of sun-stroke in 1786.

G. was one of the very best generals of the war of independence, second, perhaps, only to Washington, whose intimate friend he was.

GREENE, Robert, an English poet and dramatist, was born at Norwich about 1560, or, as stated by some of his biographers, in 1550. He was placed at St John's College, Cambridge, and took out his degree of A.B. there in 1578. He afterwards

Digitized by Google

travelled in Spain and Italy. On his return, he re-entered the university, and took his degree of A.M. at Clare Hall in 1583. He also appears to have studied at Oxford in 1588. On leaving Cambridge, he proceeded to London, where he supported himself by writing plays and romances. He poured out plays, poems, and novels, ruffled about in silks, wore long hair, and haunted taverns and places of questionable resort with such wild and profane geniuses as Marlowe and Peele. He died of the consequences of a debauch, 3d September 1592, and was buried next day in the New Churchyard, near Bedlam. After his death appeared the singular pamphlet entitled "The Repentance of Robert Greene, Master of Arts," in which he lays bare the wickedness of his former life. It is perhaps the most valuable of his prose writings. G.'s poems possess considerable grace and tenderness, but his plays have almost perished from human memory. His "Groat's Worth of Wit bought with a Million of Repentance" contains one of the few authentic contemporary allusions to Shakspeare; and when his writings are forgotten, he will be remembered for it, and for being one of the knot of young men who came up to London when the English drama was creating itself, and who burned themselves out in fierce labor and fiercer dissipation.

GREENFINCH (*Coccothraustes chloris*), a bird of the family *Fringillidæ*, common in most parts of Britain, frequenting gardens, orchards, shrubberies, small plantations, tall hedges, and cultivated lands. It is found even in Scandinavia, but is more common in the south of Europe; its range extends throughout Asia to the Pacific Ocean, and westward as far as Madeira. It is sometimes called *Green Grosbeak* and *Green Linnet* (Scot. *Green Lintie*). The bill is much thicker than that of the true linnets, to which, however, it is nearly allied. A prevailing green tint, mingling with gray and brown, characterises the plumage, and gives the bird its name. The whole length is little more than six inches. The tail is a little forked. The proper song of the G. is not very sweet, but in confinement it readily imitates the song of other birds, and in consequence of this and of its very easy domestication, it is rather a favorite cage-bird.

GREENGAGE, a variety of plum, of a green color and roundish shape, the *Reine Claude* of the French, generally esteemed as one of the finest varieties in cultivation, if not certainly superior to all others. It is not of the largest size, but in delicacy and richness of flavor it is unsurpassed.

GREENHEART, or Bebeeru (*Nectandra Rodiæi*), a tree of the natural order *Lauraceæ*, a native of Guiana, of great value as a timber-tree, and also yielding a valuable medicinal bark. The timber is commonly called *Greenheart*; the bark is better known as *Bebeeru* (otherwise *Beebeeru*, *Bibiru*, *Bibiri*, &c., and *Sipiri* or *Sipeira*), and the alkaloid to which it chiefly owes its properties is called *Bebeerine* (q. v.). The tree grows chiefly in British Guiana, and in the greatest perfection on the low hills immediately behind the alluvial lands; it rises with an erect, slightly tapering trunk to a height of 40 or 50 feet without a branch, attaining a height of 80 or 90 feet in all, and a diameter of 3 or even 4 feet. The wood is extremely strong and hard, and is imported into Britain, to be used chiefly by turners for the same purposes as lignum vitæ, which it much resembles. It takes a high polish. It is so heavy as to sink in water. It is remarkable for its durability, and for being almost exempt from the attacks of the white ants on land, and of the teredo in water. It is used in Guiana for ship-building, and for all the most important purposes for which timber is required.—The bark is hard, heavy, and brittle, with a fracture resembling that of sandstone, has a white epidermis, and is of a bright cinnamon color within. It has a very bitter, somewhat astringent taste. Its tonic and febrifugal properties resemble those of cinchona bark. Instead of the bark itself, the sulphate of bebeerine is generally used in medicine.

South America produces a number of species of *Nectandra*. *N. Puchury* yields the seeds called *Pitchurim Beans*, which are astringent, are regarded as febrifugal, and are prescribed in dysentery, diarrhœa, &c., and the oil of which is used as a substitute for chocolate.

GREEN-HOUSE, a building appropriated to the cultivation of such exotic plants as do not require much artificial heat, but cannot endure the open air, at least in the colder part of the year. The name is derived from the original use of such buildings for the preservation of oranges, myrtles, and other evergreens; the cultivation of heaths, pelargoniums, fuchsias, and the many other flowers now fa-

Digitized by Google

miliar to everybody, not having been then introduced. The first green-house of which there is any record was erected about 1619, by Solomon De Caus at Heidelberg, to shelter orange-trees. The Chinese, however, are not unacquainted with green-houses, and it is not known how long this has been the case. The earlier green-houses were glazed only on the sides; glass roofs were introduced in the beginning of the 18th c., and the arched or curvilinear glass roof, still more favorable to the proper admission of the sun's rays, is an improvement which dates from the early part of the 19th. Heat was at first supplied, when necessary, by hot embers put in a hole in the floor, afterwards by furnaces in the green-house; flues, steam, and hot-water pipes, &c., are more recent inventions. See HOTHOUSE. As a green-house does not require artificial heat during summer, the roof is sometimes made capable of being then removed; more generally, many of the plants are carried out into the open garden. Air is freely admitted into the green-house in fine weather, even in winter, during the warmest part of the day, care being taken that the plants are not exposed to frost, nor to ungenial and chilling winds. Green-houses are sometimes appropriated chiefly to particular genera of plants, under such names as *Heathery, Camellia-house*, &c. According to the present use of the term, a green-house differs from a *conservatory* only in the plants being in pots, which are very generally placed on the shelves of *stages*, having a slope not very different from that of the roof.

GREE'NLAND, a region of unknown extent northwards, stretches from its southern extremity, Cape Farewell (q. v.), along the Atlantic and Arctic Oceans on the east, and Davis' Strait, Baffin's Bay, and Smith's Sound on the west. The west coast pursues a north-north-west direction as far as Cape Alexander, in 78° 10′ n. lat. It then has a general north-easterly direction, gradually changing to easterly beyond 82° 30′. Lieutenant Beaumont, of the British Arctic Expedition of 1875—1876, followed the line of the coast with a sledge-party to 82° 54′ n. lat. and 48° 33′ w. long., when the land was beginning to trend southward. It is thus almost conclusively proved that G. is entirely distinct from the land on the west side of Smith's Sound—that in fact G. is an island. Previously our knowledge of the western coast was chiefly derived from Dr Kane, who has assigned Cape Alexander, in about lat. 78° 10′ n., as its termination. G. is said to have been first discovered about the close of the 9th c. by an Icelander named Gunbiörn, who named it Hvidsaerk (White Shirt), from its snowy headlands. It first obtained the name G. from another Icelander, Eric Rauði (the Red), who led hither an expedition in 985 or 986, and founded two settlements on the west coast, called the Oestre and Westre Bygd (the east and west colonies). About four centuries afterwards, the Westre Bygd was destroyed by the pestilence called the "black death," combined with the attacks of the aborigines; and a century after this, the Oestre Bygd suffered the same fate. G. was visited, and its west coast explored, successively by Frobisher, Davis, and Baffin, the latter having advanced as far as lat. 78° n. (the limit of the inhabited country). In our own times Dr Kane has extended his explorations as far as lat. 82° 30′, or within 520 miles of the north pole. The eastern and southern coasts appear to be so beset with ice as to be practically inaccessible. The former was explored by Dr Scoresby as far as lat. 74° 30′ n., and two inlets, Scoresby's Sound and Davy's Sound, were discovered running far into the interior. This coast-land is called by the inhabitants of the other districts Lost Greenland. Owing to the great extent of land towards the pole, the climate of G. is colder than that of corresponding latitudes further east—so much so, that in Lapland, lat. 72° n., the temperature is as high as in G. lat. 60° n. From observations made by Dr Kane between September 1853 and April 1855, in lat. 78° 37′ n., long. 70° 40′ w., the average temperature throughout the year is —3·22°, from October to April inclusive, —23·43°; from May to September inclusive, +26·07°. The greatest degree of cold was —68° in February, and the greatest heat was +53·9° in July, the only month in which the average temperature was above the freezing point. During the short summer, which in few places exceeds four months (during two of which, June and July, the sun is always above the horizon), vegetation is very rapid, the plants being for the most part the same as those indigenous to the north of Scotland, but of a more dwarfish character, the tallest trees not exceeding 18 feet. The inclemency of these regions does not affect the animal kingdom (man excepted). The walrus, seal, polar bear, arctic fox, dog, and reindeer

Digitized by Google

abound, and supply the inhabitants with almost all the necessaries of life. Black cattle and sheep have been introduced by the missionaries. The sea swarms with different species of cetacea, such as the rorqual, mysticetus, narwhal, porpoise, &c., and of fish, as the cod, salmon, and herring. Sea-fowl are also very abundant during the summer season, while guillemots, sandpipers, plovers, and grouse are also found. The only mineral which has been found in sufficient quantity for exportation is Cryolite (q. v.), which is found at Arksut, and is largely exported. Near the same locality are found veins of tin associated with ores of lead, copper, zinc, iron, molybdenum, and with cryolite, fluor-spar, zircon, and other minerals. Copper-ore is said to be abundant in various parts, and gadolinite, sodalite, tourmaline, along with garnets, iolite, rock-crystal, &c., are often found. Good coal is found in abundance on the island of Disco.

There are now 18 different Danish colonies along the west coast of Greenland—7 in North G. (north of lat. 67° n.), and 6 in South C., with a population of about 10,000, inclusive of from 200 to 300 Danes. The first settlement was made in 1721 by Hans Egede (q. v.), a Norwegian clergyman at Godthaab, who, with 43 colonists, planted a missionary station in this bleak region. This mission is supported by the Danish government. It now possesses 8 missionary stations, and the Moravians 5; from Julianehaab the most southern, to Uppernavik, at the very verge of human existence. In May 1874, the first native pastor was ordained. The population depends chiefly on the fisheries—the same which have so long attracted so many vessels from Great Britain. The exports are whale and seal oil, and cryolite; the skins of the seal, reindeer, and fox; and eider-down. The imports are wheat, brandy, coffee, sugar, tobacco, and firewood. About 10,000 or 12,000 tons of cryolite are annually exported, half going to Denmark and half to the United States. The trade to G. has always been a monopoly in the hands of the Danish government. Each settlement is managed by a trader and his assistant, who are paid by government. The whale-fisheries, which are carried on by the settlers, are also for the behoof of the Danish crown.

GREEN MOUNTAINS, a portion of the Appalachian range. See APPALACHIANS.

GREEN RIVER, a river of North America, and tributary of the Ohio, rises near the centre of the state of Kentucky, and flows through it; first in a westward direction for about 150 miles, passing the Mammoth cave, then north-westward for the remainder of its course. It joins the Ohio 9 miles above Evansville, in Indiana, and at its mouth is about 600 feet in breadth. It is upwards of 300 miles in length, and is navigable for small steamers for 200 miles. The lower course of the G. R. abounds in coal.

GREENSHANK (*Totanus glottis*), a bird of the same genus with the redshank and some of those known as sandpipers, but differing from them in the stronger and slightly recurved bill. It is about the size of a woodcock, but has much longer legs. The bill is about two inches long. The tail is short. The lower part of the tibiæ is naked. The plumage is mostly dusky brown on the upper parts, the feathers edged with yellowish white; the under parts are white. Small flocks of this bird are seen on the British coasts in the winter months, and sometimes near inland lakes and marshes. A few remain to breed in the Hebrides and north of Scotland, but the greater number repair to more northern regions. The geographic distribution of the species is extremely wide even for a bird of passage; from the arctic parts of Europe, Asia, and America, it extends southward as far as Java and Jamaica.

GREEN VITRIOL, a popular name for sulphate of iron. It sometimes occurs as an efflorescence resulting from a chemical change in *iron pyrites* or sulphuret of iron, but its quantity is generally small. It crystallises in acute oblique rhombic prisms.

GREE'NOCK, a parliamentary burgh, market town, and important seaport of Scotland, in the county of Renfrew, is situated on the southern bank of the Firth of Clyde, on a narrow strip of shore, and on the slopes of the hills which form its background, 22 miles west-northwest of Glasgow. It extends upwards of two miles along the shore, and at one place it climbs to a considerable elevation up the face of the hills, which here rapidly attain an elevation of 800 feet; while toward the west,

Digitized by Google

and all over the front of the hills, new and elegant villas are continually being erected. From the rising grounds behind the town, and from the western shore, the view of the opposite coasts of Argyle and Dumbartonshires, fringed with white gleaming villages, and of the Firth stretching away into narrow lochs and dotted over, especially in summer, with every variety of craft, is exceedingly picturesque and beautiful. The most important buildings are the Custom-house, the Exchange, the Watt Monument containing a statue of Watt by Chantrey, a museum, a lecture room, and a library, the Mechanics' Institute, &c. The harbors of G. have been constructed upon a large scale—the Albert in 1866; and from it extends westward the fine Princes Pier, opened in 1870. Its quays can be approached by steamers, and its harbors entered by vessels at any state of the tide. The commerce of the town is chiefly with North America, and the West and East Indies. The trade is mainly in sugar refining, for which it has 15 establishments, turning out refined sugars to the value of upwards of £4,500,000 annually. In ship-building, about twenty iron vessels are turned off the stocks annually. There are, besides, manufactures of steam engines, chain cables, anchors, and rope and sail making. G. has almost constant intercourse with Glasgow by river or railway, and is the general starting point for tourists *en route* for the Western Highlands and isles. It sends one member to parliament. The number and tonnage of vessels which entered and cleared at the port of Greenock for the following two years are returned as follows: In 1871, 3246 vessels, of 738,231 tons, entered and cleared the port; in 1875, 7134 vessels, of 1,706,547 tons. The sugar imported in 1830 was 18,357 tons; in 1840, 22,872 tons; in 1850, 45,815 tons; in 1860, 74,289 tons; in 1871, it was 213,090 tons; in 1873, 198,160 tons. The Globe Sugar Refining Company turns out 720 tons a week. The value of foreign and colonial merchandise imported in 1876 was £5,278,155. Pop. (1871) 57,821.

Originally consisting of only a few thatched houses, G. was created a burgh of barony in 1635 (having then a population of less than 2000), and a parliamentary burgh after the passing of the Reform Act in 1832. The prosperity of the town dates from the Union in 1707, when free commerce to America and the West Indies was opened up.

GREENS, the common name of all those varieties of kale or cabbage (*Brassica oleracea*) which do not boil, and of which the leaves are used for the table as boiled vegetables; some of which are also called colewort, &c., whilst others, particularly those with curled leaves, as German greens, have no other name than greens or kale. Young unbolled cabbages, and shoots from the stocks of cabbages, are often also called greens, as well as turnip-tops, and other leaves of plants used in the same manner.—The leaves of GERMAN GREENS are very much waved or curled. It is one of the best kinds of *open* greens. It is either sown in spring, and planted out soon after; or it is sown in autumn, and planted out in spring.

GREE'NSAND, the name given to two divisions of the Cretaceous Measures (q. v.). They are so called from the occurrence in some of their beds of numerous small green specks of silicate of iron, sometimes so abundant as to give a green color to them. The term is, however, far from being descriptive of the various included strata; it must be considered simply as a name. In some districts, especially on the continent, the green particles are entirely absent from the strata. On this account it has been proposed that the Lower Greensand should be called Neocomian, because strata of this period are well-developed at Neufchatel (Neocomum), in Switzerland. The mineral structure or lithological character of the Upper Greensand is so like that of the Lower, that it is scarcely possible to separate them when the intermediate gault is absent, except by their organic remains, which are very distinct; so much so, indeed, as to have caused the placing of the one series in the Lower Cretaceous group, and the other in the Upper. It should also be noticed that the relative importance of the two divisions is very different; the Lower Greensand includes a series of strata that are of a value nearly equal to the whole Upper Cretaceous group, of which the Upper Greensand is but a subordinate member.

The *Upper Greensand* consists of beds of sand, generally of a green color, with beds and concretionary masses of calcareous grit, called firestone. The strata on the cliffs of the Isle of Wight are 100 feet in thickness. This formation is supposed to have been a littoral deposit on the shores of the Cretaceous seas. While the

Digitized by Google

chalk was being deposited out at sea, these sands were being laid down along the shore, contemporaneous with the chalk, although they appear inferior to it. Their position would necessarily result from the cretaceous sea widening its area, and as the shore submerged, the greensand would be covered with the chalk, and would appear as an older and underlying deposit. The beds of this period are rich in fossils, abounding especially in the remains of sponges, mollusca, and echinodermata.

The *Lower Greensand* consists of a large series of more or less indurated sandstones and clays, with occasional calcareous beds. They attain a thickness of 850 feet. The sands preponderate in the upper, and the clays in the lower portion of the formation. Some beds of clay of considerable thickness, sometimes as much as 60 feet, are used as fuller's earth. The calcareous stone is a highly fossiliferous band of limestone, locally called Kentish rag, much used for building in Kent and Sussex. The formation was formerly known as the iron sand, because of the sands being cemented together by an abundance of oxide of iron; this gives them a reddish color. The Lower Greensand contains numerous fossil mollusca and other marine remains. It is a sea deposit resting on the fresh-water Wealden strata, and shewing that at this period the sea made considerable encroachments on the dry land.

GREENSTONE, a variety of trap rock (q. v.), composed of felspar and hornblende, and having generally a greenish color, hence its name. It has a more or less compact structure—the component crystals in one specimen being scarcely discernible with a pocket-lens, while in another they form a coarse aggregate, and specimens exhibiting all the intermediate stages may be found. In the finest they are not so small and compact as in basalt. Its crystalline structure separates greenstone equally from the earthy tuffs and the glassy pitchstones. It may become porphyritic from a portion of the felspar forming into larger distinct crystals. In weathering, the disintegrating greenstone assumes a dark-brown color, and exfoliates round limited centres, giving the rock an appearance as if it were composed of a number of large boulders.

GREENWEED, a name given to certain half-shrubby species of *Genista*. See GENISTA and BROOM.—DYERS' G. (*G. tinctoria*), a species about one or two feet high, with lanceolate leaves, and terminal spiked racemes of pale-yellow flowers, is frequent in woods, meadows, and hilly pastures in most parts of Europe, and in the temperate parts of Asia; and is common in many parts of England, but rare in Scotland and Ireland. Its branches, leaves, and flowers—particularly the flowers—yield a fine yellow dye, chiefly used for wool; its flowers mixed with woad yield a fine green dye. It was formerly in great esteem as a dye-stuff, but others have now almost entirely supplanted it. The leaves and seeds were also formerly used in medicine; the former as a diuretic, the latter as a mild purgative.—HAIRY G. (*G. pilosa*), a rare native of Britain, but abundant in some parts of Europe, is cultivated in some places, especially in France, as food for sheep, which are very fond of it. It is particularly adapted for light and sandy soils. It is a slender, branched, tortuous, and procumbent plant, with small pale-yellow flowers.

GREE'NWICH, a parliamentary borough of England, in the county of Kent, is situated on the right bank of the Thames, at a distance of 5 miles south-east of London. It stands partly on an acclivity, but for the most part on low marshy ground, portions of which are said to be below the level of the Thames. The older streets are in general narrow and irregular, but those more recently built are spacious and handsome. By far the most interesting institution in G. is the hospital. See GREENWICH HOSPITAL. Among the other more important buildings are the Norfolk College, which supports 22 poor inmates and a warden, and of which the Mercers' Company are the trustees; and the Royal Observatory (see OBSERVATORIES), situated in the midst of Greenwich Park, a finely-kept extent of public grounds comprising nearly 200 acres. G. abounds in taverns, and is always a favorite resort of Londoners, but specially so in the "whitebait" season—from April to August. The town contains extensive engineering establishments, iron steam-boat yards, rope-works, and several factories. G., which is also connected with London by railway, is touched at by all the river steamers. Pop. (1871) 169,861.

GREENWICH HOSPITAL, formerly a home for superannuated sailors, was a royal foundation, erected by the munificence of William and Mary, under their let-

Digitized by Google

ters patent of 1694. For many generations a royal palace had occupied the site, and had always been a favorite resort of the sovereign. The buildings were sufficiently completed by 1705 (at a cost of £50,000) to admit 100 disabled seamen. By the 1st July 1708, 350 had been admitted; and the income derived from bequests, the original royal grant, and from contributions made under coercion by sailors, amounted to £13,000 a year, half of which was expended in maintaining the seamen, and the remainder in completion of the building. In the reign of George II., the forfeited estates of the Earl of Derwentwater, who had been attainted of high treason, were granted to the hospital, and were computed at £6000 a year. Up to 1834 a compulsory contribution of 6*d*. a month was exacted from all seamen, whether of the navy or merchant service, towards the funds of the hospital; but in that year an annual grant of £20,000 from the consolidated fund was substituted.

The income from all sources afterwards reached nearly £150,000 a year, out of which the following officers and pensioners were maintained: 1 governor, £1500 per annum; lieutenant-governor, £800; 4 captains, 4 commanders, 8 lieutenants, 2 masters, 2 chaplains, a considerable staff of naval medical officers and nurses, and 1600 pensioners. The pensioners were lodged, clothed, and fed at the expense of the hospital, and in addition had the following pecuniary allowance as tobacco and pocket-money: warrant-officers, 5*s*. a week; petty-officers, 4*s*.; seamen 3*s*. The nurses were usually the widows of sailors who had lost their lives in the service.

The question had been frequently raised of late years, whether this superb charity was not, after all, a mistake, and whether the vast revenues would not be bestowed to better advantage in pensions to seamen, who might still find employment in aid of their subsistence, and who would have the happiness of passing the last days of their lives among their descendants and relatives. Under the old rules, the hospital was, as far as the pensioners were concerned, a monastery, in which hundreds of men lived together, without any of the soul-sustaining inducements of monasticism. The old men were, on the whole, painful objects to contemplate, wrecks from whom no further good of any description was to be expected. Leading lives useless to themselves and to others, their best occupation was to recount, with the garrulity of age and the boastfulness of self-absorption, the exploits of long ago. Many would have preferred to see them in happy country homes, kept by pensions from absolute want, teaching their grandchildren to delight in the country's glory, and spreading throughout the land, instead of concentrating in one parish, a knowledge of how England can provide in their old age for those among her sons who serve her faithfully in their prime.

The authorities were convinced at last that this semi-monastic enclosed life was not good for the old salts, who much preferred being with their children and friends in country villages or at seaports. Accordingly, in 1865, by the 28 and 29 Vict., c. 89, the institution ceased to exist as an asylum for aged sailors. The funds were converted into *out*-pensions, providing for a larger number than were maintained in the hospital; the old men were relegated to their friends; and the truly noble buildings, after lying vacant for some five years, became a Royal Naval College for officers to acquire naval science.

Attached to the hospital is a school for the gratuitous education of 800 sons of seamen. This establishment is under the superintendence of the same commissioners as the hospital, and with regard to funds, is consolidated with it. The education given is such as to fit the recipients for service in the royal or merchant navy; and the period during which boys are permitted to participate in its advantages extends to from three to four years.

In addition to the in-pensioners alluded to above, about 12,000 old or disabled seamen were assisted in their old age by what was called the *Greenwich out-pension*. This, however, is now styled a *Naval pension*. It varies from £3 to £51 a year. These men, distributed throughout the country, receive their pensions from the Staff-Officers of Military Pensioners, in their respective districts.

The buildings of G. H. and schools occupy the whole space, with the exception of a roadway, between the Thames and Greenwich Park; and taken together, they constitute a magnificent series of buildings, those composing the hospital being among the finest in the whole kingdom.

GREENWICH OBSERVATORY. See OBSERVATORY.

GREGARI'NIDÆ. This term was applied by Leon Dufour to designate a group of microscopic organisms belonging to the sub-kingdom *Protozoa*, which have been discovered as parasites in the intestinal canal in various invertebrate animals, especially insects, arachnidans and certain chætopodons worms. They seem to have been first observed by Cavolini in the last century, but the earliest systematic notice of them is that of Dufour in 1828, who gave them their name from the groups in which they occurred.

The form of the body varies: it may be cylindrical, ovate, fusiform, or thread-like. It is often marked by indentations or strictures corresponding to the spot where an internal septum divides the organism into two or more segments. In some, a process projects from one end of the body, or there may be two lateral processes, and to these prolongations minute hooks are attached, by which it is supposed that these animals attach themselves to the surfaces on which they are generally found. Anatomically, the G. consist of an extensible transparent membrane enclosing a granular mass, in which we observe a nucleus surrounded by a clear space. See CELLS. These organisms are colorless; their locomotive powers seem very limited; and they have neither mouth nor feet.

On carefully watching them under the microscope, we observe two of them to come in contact. The surfaces in contact become flattened, and a cyst or capsule soon forms around them and encloses them. Numerous globular vesicles are then produced in the interior, and these become ultimately metamorphosed into peculiar bodies, which are termed *pseudo-naviculæ*. The septum by which the two G. were at first divided, finally disappears; the cyst bursts, and the pseudo-naviculæ escape, and in due time burst also; and thus gives rise to bodies closely resembling amœbæ, minute animals belonging to the Rhizopoda (q. v.), which at length develop themselves into young gregarinidæ. The coalescence or conjugation of the G. is not positively essential to the formation of pseudo-naviculæ, since they are sometimes seen to occur within the bodies of single animals.

We have followed, as we believe, the best authorities in placing the G. as adult forms of the group of the Protozoa. There is, however, considerable difference of opinion regarding the position they ought to occupy. Stein places them among the infusoria, Leon Dufour, Leidig, Vogt, and others, place them under various divisions of the worms, while some have even held that they are vegetable forms.

It is exceedingly probable that certain minute parasitic organisms, occurring both on and within the bodies of fishes, and to which the term *psorospermiæ* has been applied, are identical with the pseudo-naviculæ, which we have already described.

The G. have been divided into (1) the *Monocystidæ*, when the animals are solitary; and (2) the *Zygocystidæ*, when two animals are conjoined.

Numerous memoirs have been written on the Gregarinidæ. We may especially refer to Köliker's memoir in the "Zeitsch. f. wissen. Zoologie" (1848), and the Lieberkühn's memoir on their development in the "Memoires Couronnés des Savants Etrang.," published by the Brussels Royal Academy in 1855.

GREGOIRE, Henri, the most remarkable among the so-called "constitutional" bishops of France, was born of poor parents at Vebo, near Luneville, December 4, 1750. Having received his education from the Jesuits at Nancy, he entered into orders, and for some time held a professorship at the Jesuit College of Pont-à-Mousson. A work of his, published in 1778, on the "Amelioration of the Condition of the Jews," attracted considerable notice. It was translated into English, and crowned by the Royal Society of Metz. G. soon after his ordination was appointed curé of Embermesnil, in Lorraine; and at the election for the States-general in 1789, he was chosen one of the deputies of the clergy. An ardent democrat in all his views, he attached himself from the first to the Tiers-état party, and acted a prominent part in the subsequent drama; he was one of the chief advisers of the secession, took the oath of the Tennis Court with the rest, and supported the Abbe Sieyes in the proposal for constituting the seceders into the National Assembly, of which he became one of the secretaries. From that time forward G. pursued his course without hesitation. He was one of the most enthusiastic on occasion of the famous session of the night of August 4, in the abolition and renunciation of the privileges of the nobles and clergy. G. carried into every department the stern democracy to which he was devoted, and which he identified with the Christian brotherhood of the gospel. Upon the fundamental doctrine of the Revolution—the "rights of man"—he

Digitized by Google

sought to ingraft his own early advocacy of the Jews and of the negroes. Carrying the same views into questions of church-polity, he was a zealous supporter of the civil constitution of the clergy, was the first of his order to take the oaths, and was elected the first "constitutional bishop" of the department of Loir-et-Cher. He was chosen for two places, but accepted this, although the old and legitimate bishop, Monseigneur de Themines, was still alive. When at the blasphemous Feast of Reason, the miserable Gobel, constitutional Bishop of Paris, having publicly renounced Christianity, a similar renunciation was demanded from G. by the infuriated rabble, he firmly confronted the danger and refused.—Through the later phases of the Revolution, under the Directory, G. continued to take a part in the public affairs; and to his interference are due many of the measures connected with the public organisation of literature and science, which still bear their fruits in the French system of administration. After the 18th Brumaire, he became a member of the Corps Legislatif. His extreme republicanism was highly distasteful to Bonaparte, and it was only after a third attempt that he was appointed member of the senate. On the conclusion of the concordat between Pius VII. and Bonaparte, he ceased to exercise ecclesiastical functions, as he could not be induced to give the retractations which the church authorities required. True to his old principles, he resisted every step towards the establishment of the absolute authority of Napoleon; and, in 1814, he was one of the first to pronounce against the Empire. On the Restoration, he was one of the most earnest in demanding from the king the acceptance of the constitution. During "the Hundred Days," he attracted no notice; but after the return of the king, he was excluded from the senate, and ceased thenceforth to hold any public place. During this enforced retirement, and in the intervals of leisure in his earlier political life, he published several works, literary, religious, political, historical, and polemical, the most voluminous of which are a "Cronique Religieuse," in 6 volumes, and a "Histoire des Sectes Religieuses," also in 6 volumes, but incomplete. When upon his death-bed, an effort was made by the Archbishop of Paris to induce him to express his regret for the uncanonical and schismatical proceedings of his early career; but he persistently declined to make any retractation. In consequence of his refusal, the archbishop directed that the last rites of the church should be withheld. Nothwithstanding this prohibition, the last sacraments were administered to G. by the Abbé Guillon, and he died May 23, 1831.

GREGORIAN CALENDAR AND YEAR. See CALENDAR.

GREGORIAN CHANT or Tones, the name given to certain choral melodies introduced into the service of the early Christian church by Pope Gregory the Great, who flourished towards the end of the 6th century. The music of the church in earlier times was founded on the Greek system, as far as it could be used, which was improved from time to time, until St Ambrose, Bishop of Milan, in the 4th c. invented the Ambrosian chant. See AMBROSIAN CHANT. In 599, Pope Gregory began to reform and improve the music of the church at Rome, by discarding the Greek tetrachord, or scale, on the basis of a fourth, and in its place substituting the scale of the octave, which some writers say he named by the letters of the alphabet, while others say he had a peculiar set of signs called *nota Romana*, consisting partly of words, with points, strokes, and other marks, which sufficiently served his purpose. To the authentic modes of Ambrosius, Gregory added the plagal, which began with the fourth below, and thus he completed the octave. He retained the four most useful modes of the Ambrosian chant, termed the *Dorian, Phrygian, Lydian*, and *Mixolydian*, which are supposed to have been obtained from the ancient Greeks. At first Gregory's improvement was called the *Roman chant*, but later it got the name of *cantum planum* or *firmum*, as it was originally sung in unison, and in notes all of the same length. At a later period, the letters of the Roman, as well as of the Greek alphabet, were used to express the notes of the Gregorian chant, but without any general fixed order or rule. In the course of time, the system of notation on lines and spaces came into use; but at first only four lines were used, on which we find all the old examples of the Gregorian chant written. By the Gregorian tones, or modes (*toni, modi*) of Gregory, must be understood a certain melodious formula, made out of the union of a perfect fifth and a perfect fourth, or their inversion, to give the church-

Digitized by Google

song greater variety. All the old writers agree as to the diatonic genus of the Gregorian tones, but they do not all agree as to the number of the tones; some counting fourteen, others twelve, while in some old Roman choral-books we find only eleven. The foundation of the system of the Gregorian tones may be explained thus: As there are seven notes from *a* to *g*, there should be at least seven different modes, or tone-systems, varying from each other according to the position of the semitones; but as the final or key-note of each mode might be the first note, or might be in the middle, the same scale could therefore, as it were, be viewed from two sides, which gave rise to the fourteen system of tones. It was, however, found that two of those were at variance with a fundamental rule of church-song—viz., that every mode or scale must possess a perfect fifth or perfect fourth; and that the modes containing a false fifth from *b* natural to *f* natural, or a false fourth from *f* to *b*, could not be used, and on account of the dissonant character of these intervals, must be rejected. This reduced the number of the tones to twelve. It was further found, that as four of the twelve were merely transpositions of some of the others, there were really only eight, and that they were in every respect sufficient for all the purposes of church-song. The eight Gregorian tones, as they are handed down to us, were in time fixed by a royal mandate of Charles the Great—*octo toni sufficere videntur*.

There cannot be a doubt that Pope Gregory greatly improved the church-music at the time, and that the eight tones have always been ascribed to him. That they are of great antiquity is certain, for we find them mentioned in a treatise on choral singing by one Aurelian in the 9th century. The different character of the Gregorian tones depends entirely on the places of the semitones. Several of the tones have various endings, some as many as four, while the second, fifth and sixth tones have each only one ending. For a full and interesting account of the Gregorian church-music, see N. A. Janssen's "Grundregeln des Gregorianischen Kirchengesanges," published by Schott in Mainz, 1846.

GREGORY, the name of a Scotch family remarkably distinguished, like that of the Bernoullis, in the history of science. Its history goes back to the union in marriage of the Rev. John Gregory, minister of Drumoak, Aberdeenshire, to a daughter of a David Anderson, who is described by Dr Hutton in his "Philosophical and Mathematical Dictionary," as "of Finzaugh, a gentleman who possessed a singular turn for mathematical and mechanical knowledge." The most distinguished offspring of this marriage was—

James Gregory, born at Aberdeen in November 1638 or 1639. He studied at Marischal College, after leaving which, he betook himself to optical science, in which he made his first discoveries. At the age of 24, he invented the reflecting-telescope known by his name, and which he described in a work, entitled "Optica Promota." In 1664 or 1665, he went to London with a view to the construction of his telescope; but finding the artists he employed wanting in the skill necessary for grinding the metal for the object-speculum, he passed on to the university of Padua, where he devoted himself to study; and in the year 1667, produced his "Vera circuli et Hyperbolæ Quadratura," followed, in 1668, by two other works, "Geometriæ Pars Universalis," and "Exercitationes Geometricæ." These works led him into correspondence with the greatest mathematicians of the age—Newton, Huyghens, Wallis, &c. He was immediately on his return to London, elected a Fellow of the Royal Society, and in 1669 he obtained the professorship of mathematics at St Andrews, a chair which he filled for about six years. Here, in 1672, he produced "The Great and New Art of Weighing Vanity," &c., which bore to be the work of M. Patrick Mathers, Archbedal to the University of St Andrews, the object of which was to expose the ignorance of a Professor Sinclair of Glasgow, who had put a slight on one of the St Andrews professors. In 1674, G., who had in the meanwhile married Mary, daughter of Mr George Jamieson, a distinguished painter, was called to Edinburgh to fill the mathematical chair, which he did for little more than a year. In October 1675, when shewing the satellites of Jupiter to some of his pupils, he was struck with total blindness, and a few days after died at the age of 36. For a particular list and account of his works and discoveries, see Hutton's "Philosophical and Mathematical Dictionary." Dr Hutton describes him as a man of very acute and penetrating genius, possessing an inventive mathematical genius

Digitized by Google

of the first order; somewhat irritable in temper; but exhibiting one of the most amiable characters of a true philosopher—that of being content with his fortune.

By his marriage with Mary Jamieson, James G. had a son of the same name, JAMES G., M.D., born in 1674, who became professor of medicine in King's College, Aberdeen, where he founded the School of Medicine. This James G. had two sons, JAMES G., M.D. (the second), who succeeded his father in the Aberdeen professorship; and JOHN G., M.D., who merits particular notice. He was born at Aberdeen in 1724, where he received his early education; afterwards he studied medicine at Edinburgh, Leyden, and Paris. After filling in succession the chairs of philosophy and medicine at Aberdeen, he was appointed, in 1766, professor of the practice of medicine in Edinburgh, where he long enjoyed high reputation as a teacher and practising physician, along with the greatest personal popularity. He was the intimate friend of the most eminent men of Edinburgh in its most brilliant period. He died 9th February 1773. Among his works are—"Elements of the Practice of Physic," 1772; "A Comparative View of the State and Faculties of Man with those of the Animal World," 1765; and "A Father's Legacy to his Daughters" (published after his death), 1793. In 1788 his works were collected in 4 vols. 12mo, by Mr Tytler (Lord Woodhouselee), who prefaced them by a life of the author. A Life of him was also written by Mr Smellie. His son, Dr JAMES G. (the third), became distinguished as professor of the practice of medicine at Edinburgh, and a leading man in his profession. He was the author of "Philosophical and Literary Essays," 2 vols. 8vo, Edin. 1792. The son of this Dr James was the late WILLIAM G., professor, at one time, of chemistry in King's College, Aberdeen, and who died April 1858, as professor of chemistry in the university of Edinburgh. William G. was well known by his works on chemistry, and his edition of the inorganic part of Turner's "Elements of Chemistry;" the organic part of which was edited by Liebig. He also translated, 1855, Liebig's "Principles of Agricultural Chemistry." Amongst his contributions to chemistry may be noticed his improved processes for the preparation of hydrochloric acid, muriate of morphia, and oxide of silver, and his memoirs on the preparation of sulphuric acid, on the preparation of creatine, on the decomposition products of uric acid, on the spontaneous decomposition of alloxan, on the purification of chloroform, &c.

We have now to revert to the original stock—the family of the Rev. John G. and Jane Anderson. James G., inventor of the telescope, and founder of the line of distinguished men which we have just followed, had an elder brother of the name of DAVID—a remarkable man, skilled in medicine, philosophy, and mathematics, and known as David G. of Kinardie—the first man in Scotland who kept a barometer, a circumstance which, according to Dr Hutton, nearly led to his being tried by presbytery as a wizard. This David had three sons, named respectively, DAVID, JAMES, and CHARLES. The first of these became Savilian professor of astronomy, Oxford. He was born at Aberdeen in 1661, and there received the early part of his education, which was completed at Edinburgh. He is supposed to have been disposed to mathematical studies, by having been appointed literary executor of his uncle James—of the telescope—more likely it is that he was so appointed because he had already manifested an aptitude for such studies. With the executry, at any rate, his uncle's "mantle" descended upon him. In his 23d year he was appointed professor of mathematics in the university of Edinburgh, and by his lectures in this chair, he had the honor of being the first to introduce the Newtonian philosophy into the schools. In 1691, through the friendship of Newton and Flamsteed, he obtained the vacant Savilian professorship of astronomy at Oxford, for which the illustrious Halley was a competitor. Halley, however, soon after obtained the professorship of geometry in the same university, and became a great friend and fellow-worker of Gregory's. Dr David died at Maidenhead in 1710, in his 49th year.

Among the works of Dr David G. may be mentioned "Exercitatio Geometrica de Dimensione Figurarum" (Edin. 1684); "Catoptricæ et Dioptricæ Sphæricæ Elementa" (Oxford, 1695), which contained the substance of his Edinburgh lectures, and in which, among other ingenious matters, Dr Hutton thinks there is an anticipation of Dolland's Achromatic Telescope. "Astronomiæ Physicæ et Geometricæ Elementa," Oxford, 1702. An edition of Euclid in Greek and Latin, which is

Digitized by Google

highly valued, 1708. Towards the end of his life he worked with Dr Halley on an edition of the "Conics of Apollonius," but did not live to see it finished. He was the first who considered the Catenary, on which he left a paper in MS., besides a short treatise of the "Nature and Arithmetic of Logarithms;" a treatise on "Practical Geometry," published in 1745 by Maclaurin; and many memoirs which were published in the "Phil. Trans.," vols. xviii.—xxv. Of his four sons, the eldest, David G., became regius professor of modern history at Oxford, and Dean of Christ's Church. On Dr David G. removing to Oxford, he was succeeded, in 1691, in the Edinburgh chair, by his brother James, who filled it for 33 years, when he retired, and gave place, in 1725, to Maclaurin. His brother Charles, in 1707, became professor of mathematics at St Andrews, an office which he held for 32 years, when he resigned it, and was succeeded by his son, another David, who died 1768.—The three sons of David of Kinardie were thus, at the same time, professors of mathematics in three universities, while two of them left sons who obtained professorships. Dr Thomas Reid of Glasgow, it may be mentioned, was a nephew, through his mother, of these illustrious brothers. Altogether, it is said (Chalmers's "Biographical Dictionary," p. 289) that no less than 16 members of this family have held British professorships.—Mention must be made, in conclusion, of R. F. GREGORY, late Fellow of Trinity College, author of "Examples in Differential and Integral Calculus," and other valuable works, who died before bearing the full fruits of his genius, and who is understood to have belonged to the family of the Scottish Gregories.

GREGORY, the name of sixteen popes, of whom the most important, historically, are treated in separate articles.

GREGORY I., the Great, a father and saint of the Roman Catholic Church, was born in Rome about the middle of the 6th c. of an illustrious Roman family. His father, Gordianus, was a senator, and one of the earlier pontiffs; Felix III. had belonged to the same family. At a comparatively early age G. was named by the Emperor Justin II. to the important charge of prætor of Rome; but he voluntarily relinquished this office, and withdrew altogether from the world into the monastery which he had founded in Rome, under the title of St Andrew's. This was but one of many such acts of religious munificence. "He founded and endowed," says Dean Milman, "six monasteries in Sicily." Before entering the Roman convent, equally founded by himself, which he chose for his own retreat, "he lavished on the poor all his costly robes, his silk, his gold, his jewels, his furniture, and not even assuming to himself the abbacy of his convent, but beginning with the lowest monastic duties, he devoted himself altogether to God." This was probably about 575. He was elected abbot of his monastery, and it was while he was still in this office that the well-known incident befell of his meeting the Anglo-Saxon youths in the slave-market, and on being struck by their beauty, and learning that they came from a pagan land, resolving to devote himself to the conversion of that land to Christianity. He set forth on his journey, but the clamor of the Romans at his loss led the pope Benedict to compel his return, and eventually to enrol him in the secular ministry by ordaining him one of the seven Regionary Deacons of Rome. Benedict's successor, Pelagius II., sent G. as nuncio to Constantinople, to implore the emperor's aid against the Lombards. He resided three years in Constantinople, during which time he commenced, and perhaps completed, his great work, the "Exposition of Job." On his return to Rome he resumed his place as abbot, and on the death of Pelagius, in a plague which laid waste the city, G. was unanimously called by the clergy, the senate, and the people to succeed him. He used every means, even to a petition to the Emperor Maurice to withhold his consent, to evade the dignity; but he was forced to yield, and was consecrated September 3, 590. Few pontiffs have equalled, hardly one has surpassed, G. as the administrator of the multiplied concerns of the vast charge thus assigned to him. "Nothing," says Dean Milman, "seems too great, nothing too insignificant for his earnest personal solicitude; from the most minute point in the ritual or regulations about the papal farms in Sicily, he passes to the conversion of Britain, the extirpation of simony among the clergy of Gaul, negotiations with the armed conquerors of Italy, the revolutions of the Eastern Empire, the title of Universal Bishop usurped by John of Constantinople" ("Latin Christianity," i. 439). There is no department of ecclesiastical administra-

Digitized by Google

tion in which he has not left marks of his energy and his greatness. To him the Roman Church is indebted for the complete and consistent organisation of her public services and the details of her ritual, for the regulation and systematisation of her sacred chants. The mission to England, which he was not permitted to undertake in person, was intrusted by him, with all the zeal of a personal obligation, to Augustine; and under his auspices, Britain was brought within the pale of Christian Europe. Under him the Gothic kingdom of Spain, long Arian, was united to the church. Nor was his zeal for the reformation of the clergy, and in purifying of the morality of the church, inferior to his ardor for its diffusion. His letters, which are numerous and most interesting, are full of evidences of the universality of his vigilance. On occasion of the threatened invasion of Rome by the Lombards, G. is declared by Milman to have "exercised the real power by performing the protecting part of a sovereign;" and in his general administration, to have been "in act and in influence, if not as yet in avowed authority, a temporal sovereign." Against the memory of his administration of Rome a charge was formerly made, that in his zeal against paganism he destroyed the ancient temples and other buildings of the pagan city; but Gibbon confesses that the evidence "is recent and uncertain:" and, indeed, the only authority to which Gibbon himself refers, Platina, simply mentions the charge in order to repudiate it. The same, according to Milman, may be said of "the fable of his having burned the Palatine Library in his hatred of pagan literature, which is now rejected." As regards the general government of the church, G. reprobates very strongly the assumption by John, patriarch of Constantinople, of the title of Ecumenical or Universal Bishop; the more especially, as the object of John in assuming this title was to justify an exercise of jurisdiction outside of the limits of his own patriarchate. In his writings, too, the details of the whole dogmatical system of the modern church are very fully developed. His works fill four folio volumes. His "Letters," and, still more, his "Dialogues," abound with miraculous and legendary narratives, which, however uncritical in their character, are most interesting as illustrating the manners and habits of thought of that age. G., with all his zeal for the diffusion of Christianity, was most gentle in his treatment of heathens and Jews, and he used all his efforts to repress slave-dealing, and to mitigate the severity of slavery. He died March 12, 604.

GREGORY II., by birth a Roman, was elected bishop of that see in 715. His pontificate is specially noticeable as forming an epoch in the progress of the territorial pre-eminence of the Roman see in Italy. The Eastern emperors having almost utterly abandoned the government, and, still more, the defence of Italy, and the aggressions of the Lombards becoming every year more formidable, the imperial authority in the West sunk into little more than a name; and the tyrannical and barbarous measures by which the Emperor Leo, the Isaurian, attempted to enforce his decrees against image-worship, weakened still more the tie which bound Italy to the Eastern emperors. The natural result of the diminution of the imperial authority in Italy was the growth of that of the pope, to whom the deserted Italian provinces looked, partly as their spiritual counsellor and head, partly as their mediator with the barbarous enemy, partly as the centre of the political federation for self-defence which this very isolation necessitated. G. convened a council in Rome on the subject of the honor due to images, and addressed a very energetic letter to the emperor, protesting against the sacrilegious outrages of which he had been guilty, explaining and defending the Catholic doctrine on image-worship, and warning the emperor that the feelings of his subjects were so completely alienated by his conduct, that it was only the pope's influence which prevented them from throwing off all allegiance. G. has been accused of himself fomenting this disaffection. The contrary, however, is attested, not only by G.'s own letters, but also by Paul the Deacon, in his "History of the Lombards" (book vi. c. 39); and it is quite certain that the circumstances themselves, and the well-known character of the emperor, would sufficiently explain any degree of discontent in Italy. At all events, the result of the contest was a most notable aggrandisement of the political authority and influence of the popes in Italy. G. II. died in 731.

GREGORY III., a native of Syria, succeeded Gregory II. in 731. The encroachments of the Lombards in Italy during his pontificate became so formidable, that as the Eastern emperors still remained powerless or indifferent to the protection of the

Italian provinces, the Romans charged G. to send a deputation to Charles Martel, soliciting his succor against the enemy, and proposing upon that condition to recognise him as their protector and to confer on him the title of consul and patrician of Rome. This offer was made by the pope "in virtue of a decree of the Roman princes," and is of great historical importance in the consideration of the nature and origin of the papal power in Italy. The embassy failed, owing to the pressure of his war with the Saracens, to enlist the aid of Charles; but it was a step towards the consummation of the independence of the West. G. III. died in 741.

GREGORY VII., pre-eminently the historical representative of the temporal claims of the mediæval papacy, was born about 1020 at Saona, a village in the southern border of Tuscany. Whether his family belonged to the burgher or the noble class, is disputed by his biographers. His family name, Hildebrand, would imply a Teutonic descent; but by birth and education, at least, he was Italian. His youth was passed at Rome in the monastery of St Mary on the Aventine, of which his uncle Laurence (afterwards Bishop of Amalfi), was abbot. From Rome he passed into France, where he entered the celebrated monastery of Cluny, in the schools of which he completed his education; and from the strict ascetic observances there practised by him, he acquired those habits of austerity which distinguished his entire life. He visited the court of Henry III., and obtained by his preaching the reputation of great eloquence. On his return to Rome he became the chaplain of Gregory VI., but after the death of that pontiff he again withdrew to his former retreat at Cluny, from which he was only recalled by the earnest appeal of the new and zealous pope, Leo IX., whom he accompanied to Rome in 1049. Under this active and devoted pontiff, Hildebrand exercised great influence. He now for the first time entered into holy orders, and was eventually created cardinal. Besides the important domestic employments which were assigned to him, he was sent as legate to the important council of Tours, in which the cause of Berengar was examined. Under all the short but important pontificates of the successors of Leo IX., who are known in history as the German popes—Victor II., Stephen IX., Benedict X., and Alexander II.—Hildebrand continued to exercise the same influence, and by inspiring into their government of the church the great principles to which his life was vowed, he prepared the way for the full development of his own theory of the papacy. He was unanimously elected at Rome, without awaiting the imperial authorization, three days after the death of Alexander II. The German bishops, who feared the strong arm of those reforms of which his name was a guarantee, endeavored to prevent the Emperor Henry IV. from assenting to the election; but Henry gave his approval, and the new pope was crowned July 10, 1073. From the date of his election, the pontificate of G. was one life-long struggle for the assertion of the principles with which he believed the welfare of the church and the regeneration of society itself to be inseparably bound up. Regarding as the great evil of his time the thoroughly secularised condition of the church in a great part of Europe, and especially in Germany and Northern Italy, he directed against this all his efforts. The position occupied by the higher clergy as feudal proprietors, the right of investiture with the temporalities of benefices claimed by the crown, the consequent dependence of the clergy upon the sovereign, and the temptation to simony (see SIMONY) which it involved, were, in the mind of G., the cause of all the evils under which Europe was groaning; and of all these he regarded investiture (see INVESTITURE) as the fountain and the source. While, therefore, he labored by every species of enactment, by visitations, by encyclical letters, and by personal exhortations, precepts, and censures, to enforce the observance of all the details of discipline—celibacy, the residence of the clergy, the instruction of the people—and to repress simony and pluralism, it was against the fundamental abuse of investiture that his main efforts were directed. In the year after his election, he prohibited this practice, under pain of excommunication both for the investor and the invested, and in the following year he actually issued that sentence against several bishops and councillors of the empire. The Emperor Henry IV. (see HENRY IV.), disregarding these menaces, and taking the offending bishops under his protection, G. cited him to Rome, to answer for his conduct. Henry's sole reply was a haughty defiance; and in a diet at Worms in 1076, he formally declared G. deposed from the pontificate. G. was not slow to retaliate by a sentence of excommunication; and in this sentence, unless revoked or removed by absolu-

Digitized by Google

tion in twelve months, by the law of the empire at the time, was involved the forfeiture of all civil rights, and deposition from every civil and political office. Henry's Saxon subjects appealing to this law against him, he was compelled to yield, and, by a humiliating penance, to which he submitted at Canossa, in January 1077, he obtained absolution from the pope in person. This submission, however, was but feigned; and on his subsequent triumph over his rival, Rudolf of Swabia, Henry resumed hostilities with the pope, and in 1080 again declared him deposed, and caused to be appointed in his place the antipope Guibert, Archbishop of Ravenna, under the name of Clement III. After a protracted siege of three years, Henry, in the year 1084, took possession of Rome. G. shut himself up in the castle of St Angelo. Just, however, as G. was on the point of falling into his enemy's hands, Robert Guiscard, the Norman Duke of Apulia, entered the city, set G. free, and compelled Henry to return to Germany; but the wretched condition to which Rome was reduced obliged G. to withdraw first to Monte Cassino, and ultimately to Salerno, where he died, May 25, 1085. His dying words are a deeply affecting, but yet a stern and unbending profession of the faith of his whole life, and of the profound convictions under which even his enemies acknowledge him to have acted. "I have loved justice and hated iniquity; therefore I die an exile." The character of G. VII., and the theory of church-polity which he represents, are differently judged by the different religious schools; but his theory is confessed by all, even those who most strongly reprobate it as an excess, to have been grand in its conception, and unselfish in its object. "The theory of Augustine's city of God," says Milman, "no doubt swam before his mind, on which a new Rome was to rise, and rule the world by religion." In his conception of the constitution of Christian society, the spiritual power was the first and highest element. It was to direct, to command the temporal, and, in a certain sense, to compel its obedience; but as the theory is explained by Fenelon, by Gosselin, and other modern Catholics, the arms which it was authorised to use for the purpose of coercion were the arms of the spirit only. It could compel by penalties, but these penalties were only the censures of the church; and if, in certain circumstances, temporal forfeitures (as in the case of Henry IV.) were annexed to these censures, this, it is argued, was the result of the civil legislation of the particular country, not of any general ecclesiastical law. Thus, in the case of Henry, the imperial crown was forfeited, according to the Swabian code, by the mere fact of the emperor's remaining for twelve months under excommunication without obtaining absolution from the sentence. Moreover, whatever may be said of the power in itself, or of the lengths to which it has at times extended, the occasion and the object of its exercise in the hands of G. were always such as to command the sympathy of the philosophical student of the history of the middle age. By his firm and unbending efforts to suppress the unchristian vices which deformed society, and to restrain the tyranny which oppressed the subject as much as it enslaved the church, he taught his age "that there was a being on earth whose special duty it was to defend the defenceless, to succor the succorless, to afford a refuge to the widow and orphan, and to be the guardian of the poor." Dean Milman sums up his history of G. as of one who is to be contemplated not merely with awe, but in some respects, and with some great drawbacks, as a benefactor of mankind.—See Milman's "Latin Christianity," vol. iii.; Bowden's "Life of Gregory VII." (1840); Voigt's "Hildibrandt als Papst Gregor VII. und sein Zeitalter."

GREGORY XIII., Hugh Buoncompagno, was born at Bologna, January 7, 1502. He was educated in his native city, where he held the professorship of law for several years. Having settled at Rome in 1539, he was distinguished by several important employments, and was one of the theologians of the council of Trent, on his return whence, he was created cardinal in 1564, and sent as legate to Spain. On the death of Pius V., G. was elected pope in 1572. Not one among the post-reformation pontiffs has surpassed G. in zeal for the promotion and improvement of education; a large proportion of the colleges in Rome were wholly or in part endowed by him; and his expenditure for educational purposes is said to have exceeded 2,000,000 Roman crowns. The most interesting event of his pontificate, in a scientificate point of view, is the correction of the calendar (see CALENDAR), which was the result of long consideration, and was finally made public in 1582. A grievous imputation rests on the memory of G. from the fact of his having ordered

Digitized by Google

a *Te Deum* in Rome on occasion of the massacre of St Bartholomew (see BARTHOLOMEW); but in justice it must be said, that this was done on the report of the French ambassador, which represented that bloody event, not as a deliberate aggression on the part of the Catholics, but simply as the suppression of a baffled Huguenot conspiracy. G. published a valuable edition of the "Decretum Gratiani" with learned notes. He died in 1585, in the 83d year of his age.

GREGORY NAZIANZEN—from his erudition in sacred literature also called the THEOLOGIAN—was born about 329 at Arianzum, a village near Nazianzus, in Cappadocia, not far from Cæsarea. His father, whose name also was Gregory, and who had originally belonged to the heathen sect of Hypsistatics, i. e., Worshippers of the Most High, but also of the fire, like the Persians, and keepers of the Jewish Sabbath and the law of the purity of meats, had, chiefly at the instigation of his pious wife Nonna, become a convert to Christianity about the time of the great Nicæan Council (325), and four years later was raised to the dignity of Bishop of Nazianzus. Formed to piety by domestic example, G. was at an early age sent, for the purpose of finishing his education, to Cæsarea, in Palestine, where the study of eloquence then flourished. He then visited the schools of Alexandria, and subsequently of Athens, where he met Basil the Great, then also a young student, and became his most intimate friend. At the same time, there studied at Athens, Julian, later emperor and apostate, and there is no doubt that the three often met and had friendly discussions on the subjects of their common studies; although G., even at that time augured no good for Julian, who exhibited signs of "an unsettled and arrogant mind." G. having made brilliant progress in eloquence, philosophy, and sacred literature, returned to Nazianzus, and here first received baptism at the hands of his own father, consecrating to God, at the same time, all "his goods, his glory, his health, his tongue, and his talents;" and, in order to be still more able to pursue a life of austere devotion, he retired into solitude, and took up his abode with Basil in the desert near the river Iris, in Pontus. Recalled by his father, G. was ordained priest, and afterwards fled; and being recalled a second time, he returned to Nazianzus, assisted his father in the ministry, and preached to the people. In 371 or 372, St Basil, who in the meantime had become Bishop of Cæsarea, prevailed upon him to accept the see of Sasime, a small town in Cappadocia. But he had scarcely taken possession of his new dignity, when, overcome again by his innate repugnance to public life, he retired, a bishop without a bishopric, to Nazianzus, where he stayed until the death of his father in 373. He then went into a monastery at Seleucia, which, however, after the death of the Emperor Valens (378), he was induced to leave, in order to undertake the charge of a small Nicæan congregation in Constantinople, where, until then, Arianism had held undisputed sway. G. was after a short time, when his erudition and eloquence became conspicuous, elected archbishop, upon which the Arians became so exasperated that his very life was in danger. G., although upheld by the Pope Damasus and the Emperor Theodosius, preferred resigning his see voluntarily, "in order to allay the storm, like another Jonah, although he had not excited it." He went back to Nazianzus, and took up his solitary abode near Arianzus, where, after some years of a most ascetic life, he died in 389. His ashes were conveyed to Constantinople, and thence, during the Crusades, to Rome. His day is, with the Latins, the 9th of May. His character and temper, ardent and enthusiastic, but at the same time dreamy and melancholy, hard, but also tender, ambitious and yet humble, all his instability and vacillation between a life of contemplation and of action, are vividly depicted in his writings, which mostly serve the great aim of his life—to uphold the integrity of the Nicæan orthodoxy against the heresies of the Arians and Apollinarists. The merits of his writings—which vividly portray the instability and vacillation of his life—are very unequal: sometimes not inferior to the sublimest flights of poetical genius, and withal of a classical elegance and refinement, they at other times become redundant, pedantic, and heavy with far-fetched similes. Notwithstanding all this, G. may fairly be pronounced one of the first orators and most accomplished and thoughtful writers of all times. His surviving works consist chiefly of about 58 orations, 242 letters, and 156 poems—meditations, descriptions, acrostics, epigrams, &c.—to which Tollius (Utrecht, 1696) has added 20 more, which he called "Carmina Cygnea." Muratori published (Padua, 1709) 228 other unedited epigrams. The first edition of his complete works appeared at Basel in 1550, folio. Another

Digitized by Google

edition appeared in Paris 1609—1611 (2 vols., folio), by Morel, which was reprinted in Paris in 1630; Leipsic (or rather Cologne), 1690, and Venice, 1753; but none of these is sufficiently accurate. The last edition, but little improved, under the auspices of the Benedictines, appeared in 2 vols. (Paris, 1760—1840). His separate works have frequently been edited and partly translated into different tongues.

GREGORY OF ARMENIA, commonly called THE ILLUMINATOR, was the apostle of Christianity among the Armenians. Like the majority of the bishops of the primitive church, little is known of his early history. He is said to have been educated at Cæsarea, in Cappadocia, where, at the same time, he was instructed in the Christian religion. He afterwards entered into the service of Tiridates, king of Armenia, by whom he was subjected to severe persecution on account of his refusal to worship idols. Some severe public calamity which succeeded, being looked upon as a proof of divine wrath, the king immediately put himself and his subjects under G.'s instructions. The people were converted in great numbers, and churches immediately erected throughout the country; and G., after receiving ordination at Cæsarea, returned as metropolitan of Armenia, and baptised his converts. This took place about the beginning of the 4th century. Many authors have given in their works discourses professedly by G., but now believed to be spurious. The memory of G. is held in great reverence in the Greek, Coptic, Abyssinian, and Armenian churches, and he is one of the saints of the Roman Calendar.

GREGORY OF NYSSA, Saint, a Greek Church-father, and the younger brother of Basil the Great, born about 332 at Sebaste, devoted himself at an early age to the study of sciences and philosophy, and subsequently married a pious and honorable lady. In consequence of a dream, however, he separated from her, and abjuring the world, entered upon the duties of an ecclesiastic. After a short relapse into his old profane studies, he renounced this "apostacy" forever, and in 372 was made Bishop of Nyssa, a city in Cappadocia, in Lesser Armenia, much to the dismay of the Arians, who knew him to be a zealous defender of the Nicene creed. They at once commenced an opposition to him. G. was deposed by the emperor, and compelled to flee. He lived for some years in seclusion, until, at the death of Valens (378), Gratianus restored him to his see. In 379, he was charged by the council of Antioch, to visit the churches in Arabia and Palestine, in order to restore them to their pristine orthodoxy and peace, the many years of heresy and dissension that had preceded having created a sad confusion among the flock of the faithful. In 381 he was chosen by the council of Constantinople to be one of the "Centres" of faith for the Catholic communion, i. e., an arbiter of orthodoxy for this and other congregations, principally in Pontus. He further assisted at the councils held in that city in 382 and 383, and played so prominent a part in both, that shortly afterwards the honorable title of Metropolitan was unanimously conferred upon him. The last time G. seems to have appeared publicly, was at the council at Constantinople in 394; and he seems to have died shortly afterwards. The second Nicæan council conferred upon him the pre-eminent title of "Pater Patrum."

His writings are extremely numerous. Although not fraught with the glowing eloquence and penetrating acumen of a Gregory Nazianzen, or a Basil, they exhibit a greater depth of poetical feeling and philosophical thought, while, at the same time, they abound in practical teachings and wise counsels for every stage of life. The fanciful, often puerile subtleties and conceits which occur no less frequently, are rather to be put to the account of the times in which G. lived, when symbolism and allegory reigned supreme. On the other hand, G. cannot be praised too highly for having been one of the first who manfully stood out for the ancient Greek—albeit heathen—philosophy. His writings are indeed fully imbued with Platonism and Aristotelianism, and he went as far as to borrow the technical terms of these masters for his theological investigations. "As the Israelites borrowed from the Egyptians," he said, "so Christianity must carry along with it all that is costly out of the pagan camp;" a saying which, however, has been attributed to some other Fathers of the early church. His orthodoxy has been questioned in later times; chiefly on account of his strongly condemning as heathenish the view that religion was mostly dependent on the dogma: according to him, religion was more a matter of the heart and of feeling. The council of Ephesus solemnly and most energetically declared for the soundness of his teaching, refuting the heretics out of his own

Digitized by Google

writings. Of his Christology—in the main that of Origen—viz., that the Logos had penetrated all parts of the human nature, and thus elevated it to himself, we will treat under this latter. The Latins celebrate the day of G. on the 10th of January, the Greeks on the 9th of March. His most celebrated works are a catechetic treatise; a dialogue of the Soul and Resurrection, called "Macrinia," after his sister (supposed to have been held at her death-bed); a treatise on the "Holy Trinity and the Deity of the Holy Ghost," besides a number of homilies. The first complete Latin edition of his writings, comprising dissertations on the Old and New Testament, dogmatical and controversial treatises, discourses, sermons, panegyrics, biographies, letters, &c., appeared at Cologne in 1537 (folio), and was followed by others at Basel (1562 and 1571), and Paris (1573 and 1603). The first Greek and Latin editions by the Jesuit Gretier appeared in Paris (1615—1618), in 2 vols., fol., and was reprinted there in 1638. Separate works of G. have been edited repeatedly, but next to none have appeared in any modern translation.

GREGORY OF TOURS, originally called GEORGIUS FLORENTINUS, born 544 at Auvergne, in a family exalted by rank as well as by piety. On the paternal side he traced his descent from Vellius Epagatus, the martyr of Lyon; on the maternal, from St Gregory, Bishop of Langres. St Gallus, Bishop of Clermont, G.'s uncle, undertook his early education, and, after his death, G. continued his studies under St Avitus, the successor of Gallus in the bishopric. Ordained deacon, G. left Auvergne and went to the court of Siegbert, king of Austrasia. Still very young, he was elected to the see of Tours, and he was consecrated by Giles, Archbishop of Rheims. The first years of his episcopacy were a season of great perplexity, owing to the constant contentions of the first Merovingian kings. His courage and firmness however were equal to any of the severe tests to which they were exposed, and by openly resisting even royal authority on some occasions, he drew upon himself the hatred of Queen Fredegunda and the ire of her husband, King Chilperich, who seems to have been a mere tool in her hands. G. was accused of seditious and other treasonable actions, and summoned before a council of bishops in 580. Here, however, he defended himself with such clearness and vigor, that Chilperich himself, strange to say, from that moment ceased to be his foe, and becoming even his warm admirer and friend, charged him afterwards with many important political missions. This royal partiality however does not seem to have prevented G. from occasionally calling the king a Herod and a Nero. No less favored by the king's successors, Gontram and Childebert II., G. did not fail to use all his influence with the court for the amelioration of the position of the church, and the general condition of his flock. His travels had, apart from their political purposes, at the same time the object of everywhere restoring peace and piety, so much needed in those days in convents and churches, among the clergy and the laity. Of his journey to Rome in 590, the circumstances of which are related with a minuteness of itself surprising; of the pope's wonder at finding in G., instead of the imposing man he had expected to behold, a *homuncio*, or manikin, and of his answer, that "we all are as God had made us," we can only say, that according to the lucid investigations of Dr Kries ("De Greg. Tur. Vita et Scriptis," p. 16), it never can have taken place. His last journey seems to have been to Orleans, whither he accompanied the king in 593. He died shortly after, in 594 or 595, at Tours, where he had been a bishop for twenty-three years. His works comprise, in the first place, his ten books of Frankish history, "Gesta, Chronicon Francorum"—the first attempt at French historiography—and have earned for G. the name of "Father of Frankish History," although its crudity of style, and indiscriminate mixing up of everything important and otherwise, make it partake much more of the nature of a chronicle than of a history properly so called. G.'s other works are: "A Book of the Glory of the Martyrs;" "Of the Miracles of St Julian" (304); "Of the Glory or Miracles of the Confessors;" "Of the Miracles of St Martin;" and a book of the lives of the Fathers, consisting of 23 biographies of Frankish ecclesiastics, and many other minor writings. Much more, however, is generally attributed to G. than is in reality his. The first critical edition of his works, by Ruinard, appeared in Paris, 1699, fol.; the latest, by Guadet and Taranne, Paris, 1836 and 1837, with a French translation. Of monographies on G., we may mention "De Greg. Tur. Episc. Vita et Scriptis," by C. G. Kries and Löbell; "Gregor von Tours und seine Zeit" (Leip. 1839, 8vo).

GREGORY THAUMATU'RGUS (Wonderworker), originally called THEODORUS, SAINT, born at Neocæsarea, in Pontus, between 210 and 215. Sprung from an illustrious and wealthy heathen family, he was educated for a rhetorician or advocate; but an acquaintance which he formed with Origen at Cæsarea, in Palestine, allured him to the field of sacred science. G. forgot Roman law, applying himself instead, under his new master, with zeal and fervor to the study of the Holy Scriptures and of profane philosophy. Several years had thus passed, when Maximin's persecutions forced Origen to leave Cæsarea. G. then went to Alexandria, and stayed there for three years (235—238). Gordian having succeeded Maximin, Origen returned to Cæsarea, and G. went to join him there, and to renew his former studies under him. Most probably it was at that period also that he was baptised, and changed his heathen name of Theodorus. Recalled to his family, G., instead of striving for those posts of honor for which he had been destined, retired into solitude; but was so often besought to return and labor for the church, that he allowed himself to be consecrated about 240. Installed as bishop at Neocæsarea, a wealthy and populous, but utterly unchristian city, G. applied himself to his holy work with the utmost zeal. He wrought, according to ancient testimony, many miracles, such as recalling devils, whom he had frightened out of a heathen temple, at his will, and thereby converting its chief functionary to Christianity; moving a stone, staying a river, killing a Jew by his mere wish, changing a lake—a matter of contest between two brothers—into solid earth, and thus contrived to change the unbelieving population of his see into devout Christians.

During the persecution of Decius, which broke out in 250, G. fled with a great part of his flock, whom he would not see exposed to the danger of having either to change their faith, or to die the death of martyrs, and during this flight, he, once when hard pressed by his pursuers, transformed himself and his deacon—the heathen priest whom he converted by recalling the devils—into trees. In 251, the Emperor Decius died, and G. returned to Neocæsarea. He now instituted a general festival for those Christians who had fallen during the persecution, and permitted the faithful to celebrate it with banquets and sports like those which accompanied heathen festivals—a proceeding by which he intended to draw over the pagan multitude to christianity, but which has been severely blamed, and which, indeed, was fraught with great mischief for the church in later times.

In 264, we find him, together with his brother Anthenodorus, at the Council of Antioch, which had been convoked for the purpose of condemning the heresies of Paul, Bishop of Samosata, their signatures occurring first in the Acts of the Council. Whether or not G. also took part in the second council (269), necessitated by Paul's refusal to abdicate, is very uncertain. Of his own extraordinary piety, devotion, truthfulness, and modesty, of his "prophetic and apostolic temper," the best testimony lies in the fact that St Basil, St Maximus, and other great luminaries of the church, call him a second Moses or Paul.

The only genuine works of G. are a panegyrical discourse on Origen, which he delivered in public before his return to his native place; the above-mentioned creed; a Metaphrasis on Ecclesiastes, often and wrongly attributed to Gregory of Nazianzus, in twelve chapters; and a Canonical Epistle, setting forth the punishments and penances to be undergone by such Christians as had bought booty from pagan soldiers, a practice very common in those times of constant invasions of Goths and Scythians in Asia, principally in Pontus. All other writings shewn under his name are spurious. The first collected edition of his works was published by Ger. Vossius at Mayence in 1604; a more complete edition appeared in Paris, 1622, in folio.

GREI'FENBERG, a small manufacturing town of Prussia, in the province of Pomerania, is situated on the left bank of the Rega, 40 miles north-east of Stettin. It is a decayed place, but has still some manufactures of stoves and of linen. Pop. (1875) 5630.

GREI'FENHAGEN, a town of Prussia, in the province of Pomerania, is situated on the right bank of the Reglitz, 13 miles south-south-west of Stettin. The town has two churches, and is the seat of considerable industry. Pop. (1875) 6759.

GREI'FSWALD, a town of Prussia, in the province of Pomerania, is situated on the Rick, about 3 miles from its mouth, and 20 miles south-east of Stralsund. It is

Digitized by Google

regularly built, and is surrounded by promenades, into which the former ramparts have been converted. Among its houses are several curious brick structures, dating from the 14th and 15th centuries. G. contains, besides other public institutions, a gymnasium and a university (founded in 1456), attended by about 500 students. The university library contains about 180,000 volumes. Weaving, machine-making, salt-works, and manufactures of paper, tobacco, soap, leather, and oil are carried on, as well as commerce. G. possesses some 60 ships of about 16,000 tons. Pop. (1875) 18,016.

G. was founded in the 13th c., before the close of which it made one in a union of Wendish Hanse-towns, comprising Stralsund, Rostock, Weimar, and Lubeck. At the peace of Westphalia (1648), the town came into the possession of Sweden; but, together with the whole of Swedish Pomerania, it was conceded to Prussia in 1815.

GREIZ, a town of Central Germany, capital of the principality of Reuss-Greiz, and seat of the sovereign prince, is charmingly situated on the right bank of the White Elster, 49 miles south-south-west of Leipzig. It is well built, is surrounded by walls, and contains three castles, one for winter, another for summer occupation, with beautiful gardens and park; the third, which is built on an isolated rock, is used for public offices. The town-house, a handsome specimen of Gothic, was built in 1841. Nearly 3,000 hand-looms are here employed in the manufacture of woollen and half-woollen goods; one factory contains 500 looms. Pop. (1875) 12,657.

GRENA'DA, an island of volcanic origin in the British West Indies, is said to be the most beautiful of the Caribbees. With an area of 133 square miles, it contained in 1871, 37,684 inhabitants, mostly of African descent. Of these only 400 or 500 are whites, the rest are people of color. Very considerable importations of coolies have taken place. On the coast are several good harbors; while a central ridge of mountains here and there presenting an elevation of 3000 feet, possesses various extinct craters, some of them transformed into considerable lakes. The chief towns are St George, St Mark, St Patrick, St Andrew, and Charlotte-Town. The first of these, which is the seat of government, stands in lat. 12° 2′ n., and in long. 61° 48′ w. In 1866 there were 27 schools, consisting of the normal and grammar school, the central schools, and parish schools, with an attendance of 1418. The public revenue amounted in 1875 to £26,570. The imports and exports were respectively represented by £118,385 and £171,332; the corresponding results in 1838, virtually the last year of unmitigated slavery, having been £73,846 and £288,683. Among the exports are sugar, cotton, and cocoa; the last of which seems likely to become the staple.—The island was discovered by Columbus on his third voyage in 1498, at which time it was inhabited by Caribs, who were subsequently exterminated by the French, into whose hands G. came about the middle of the 17th century. It finally fell into the possession of the British in 1783.

GRENA'DE, a small shell about three inches in diameter, of iron or annealed glass, filled with powder, and thrown from the hand. Hurled among dense masses of troops, as those assembled in the ditch of a fortress during an assault, grenades are particularly embarrassing, the splinters inflicting deep wounds and causing great confusion. The discharge is effected by means of a small time-fuse. Grenades are occasionally rolled over the parapet, through wooden troughs, into the trench below: there is also a species of hand-gun fired from a rest, called "musketon," from which grenades may be projected to a short distance. These missiles are said to have been first used in the year 1594.

GRENADIER', originally a soldier who was employed in throwing hand-grenades, but in modern parlance a member of the first company of every battalion of foot, in which the tallest and finest men of the regiment are placed. This company used to be distinguished from the rest by tall bearskin caps; it holds the place of honor, viz., the right, when in line, and the front when in column of attack.

GRENADIER GUARDS, the first regiment of Foot Guards in the British Household Brigade of Guards, and generally considered the finest corps in the army. It comprises 2340 officers and men, divided into three battalions. The officers of this

Digitized by Google

fashionable corps are usually from the families of the nobility or more distinguished landed gentry. The First Foot Guards, under which name the regiment was originally known, was first raised in 1660; since then it has ever borne an honorable position in all the wars of the country, and especially in the Peninsula, at Waterloo, and in the Crimea.

GRENADI'NES, a chain of islets in the West Indies, extending between Grenada, on which they are chiefly dependent, and St Vincent, from lat. 12° 30′ to 13° n. They vary in size from about 7000 acres downwards. The largest is Carriacou. Much inconvenience is caused by their deficiency in streams and springs, an evil which, of late years, has been increasingly felt, from the injudicious destruction of the timber.

GRENELLE, a suburb of Paris (q. v.).

GRENO'BLE (a corruption of the Lat. *Gratianopolis*, or City of Gratian), an important town and strong fortress of France, with double enclosures, capital of the department of Isère, is pleasantly situated on both banks of the river of that name, in a beautiful and fertile district, surrounded by high mountains, and about 58 miles south-east of Lyon. It is divided by the Isère, which is here confined within handsome quays, into two unequal portions: the one, narrow and contracted, and consisting of only two streets, situated on the right bank of the river at the foot of a hill, is called Saint Laurent; the other, a much more important quarter, containing all the public buildings, and consisting of spacious and well-lighted streets, on the left bank, is called Bonne. Among the public buildings are the Palais de Justice, with a Gothic oriel, originally the palace of the Dauphin, and the most interesting old building in the town; the Académie Universitaire; the town-hall; the public library, containing 80,000 volumes and 1200 MSS.; and the picture-gallery. G. has gained a reputation for its manufacture of gloves (in making which from 14,000 to 15,000 persons are employed), liqueurs, perfumes, and silk goods. Pop. (1872) 28,668. In the vicinity lies the village of Chartreuse, from which the Carthusian monks derive their name, and where they originated.—See Champollion Figeac, "Antiquités de G." (Gren. 1807), and Pitot, "Histoire de G. et de ses Environs" (Gren. 1829).

GRENVILLE, George, and English statesman and reputed author of the Stamp Act, which first drove the American colonies into resistance, was born in October 1712. He was brother to Richard Grenville, Lord Temple, and brother-in-law of the Earl of Chatham. He entered parliament in 1741, and from 1744 to 1762 filled several minor government offices. In 1757 he introduced a bill for the regulation of the payment of the navy. In 1762 he became Secretary of State, and then First Lord of the Admiralty; and in the following year he succeeded Lord Bute as Prime Minister, uniting in himself the offices of Chancellor of the Exchequer and First Lord of the Treasury. He resigned the premiership in 1765, and died in 1770. G. was distinguished for eloquence, public spirit, business qualities, and extensive knowledge; but his imperious nature made him an unpopular minister, alike with the king, the parliament, and the people.

GRENVILLE, William Wyndham, Lord, third son of the preceding, was born in October 1759. After studying at Eton and Oxford with brilliant success, he became a member of the House of Commons in 1782, and attended his eldest brother, Lord Lieutenant of Ireland, in the character of secretary. Soon after he became Paymaster-general of the Army, and in 1789 was chosen Speaker of the House of Commons. In 1790 he was appointed Secretary of State for the Home Department, and was raised to the peerage with the title of Baron Grenville. He became Foreign Secretary in the ensuing year. He resigned office, along with Pitt, in 1801, on the refusal of George III. to give his assent to the Catholic Emancipation Bill. He was Premier in 1806—1807. In 1809 he was chosen chancellor of the university of Oxford. From 1809 to 1815 he acted along with Earl Grey, and he generally supported Mr Canning. Lord G. was an able speaker, with much influence among the Peers, and an excellent scholar. He died in 1834.

GRESHAM, Sir Thomas, founder of the London Royal Exchange, descended from an ancient Norfolk family, was the second son of Sir Richard Gresham, an opulent merchant elected in 1537 Lord Mayor of London. Born in 1519, he was first apprenticed to his uncle, Sir John Gresham, a wealthy London mercer, and then

Digitized by Google

sent to study at Gonville Hall, now Caius College, Cambridge. In 1543 he was admitted a member of the Mercers' Company. His father, who died in February 1548, had been one of Henry VIII.'s domestic financial agents; and in 1552 G. was sent to Antwerp as king's factor there, in consequence of the mismanagement of the person previously in charge. In two years he paid off a heavy loan, entirely restored the king's credit, and introduced a new system of finance. The principal duty of the royal agent was the negotiation of foreign loans; and during the long period he held the office, he was successfully employed in many most important and difficult money transactions. As he was a Protestant, Queen Mary, on her accession, sent him his dismissal; but on presenting a memorial of his past services, he was soon reinstated. By Queen Elizabeth, he was, in 1559, knighted, and appointed, for a short time, English ambassador at the court of the king of Spain's regent at Brussels. The troubles in the Netherlands compelled him, in 1568, to withdraw finally from Antwerp, to which city he had made more than forty journeys on the service of the state, in one of which, in 1560, he was thrown from his horse and rendered lame for life. In 1569, by his advice, the plan of borrowing money from the London merchants, instead of from foreigners, was adopted, to the great advantage of the mercantile body. Having, in 1564, lost his only son, Richard, he resolved upon devoting a portion of his great wealth to the erection of a bourse or exchange, in imitation of the one at Antwerp, for the London merchants, who were wont to meet in the open air—a project which had originated with his father. It was formally opened, in 1570, by Queen Elizabeth in person, on which occasion she dined with the founder, and named it the Royal Exchange. Renowned for his hospitality and liberality, he frequently entertained foreign personages of distinction, and erected a magnificent mansion at Osterly Park, near Brentford, where he was visited by Queen Elizabeth. For the endowment of a college in London, he directed by his will that his town-mansion in Bishopsgate Street should be converted into a residence and lecture-rooms for seven professors, to be salaried out of the Royal Exchange revenues. Gresham College was taken down in 1768, and the ground on which it stood—now occupied by the Excise Office—was transferred to government. The lectures are now delivered in a lecture-hall built at the corner of Basinghall and Gresham Streets out of the accumulated fund. The subjects of lecture are divinity, physic, astronomy, geometry, law, rhetoric, and music. G. also provided for the erection and support of eight alms-houses, and made many other charitable bequests. He died suddenly, November 21, 1579.

GRETNA GREEN, originally the name of a farmstead in the vicinity of the village of Springfield in the parish of Graitney, in Dumfriesshire, Scotland, but frequently applied to the village of Springfield itself, which is situated about a mile and a half north of the north-eastern extremity of the Solway Firth. The village was long the centre of extensive smuggling operations, and more recently it became famous (or infamous) for its irregular marriages. See next article.

GRETNA GREEN MARRIAGES, the name given to marriages of English persons contracted at Gretna Green. This spot being the first convenient halting-place for runaway couples from England, gave the name to this kind of marriage, originally an easy mode of evading the English Marriage Act, which required the consent of parents and guardians, publication of banns, and the presence of a priest—all of which involved considerable publicity and an inconvenient delay, but which were got rid of by the parties passing the English border into Scottish ground. The rule being, that a marriage is valid if contracted according to the law of the place where the parties enter into the contract, it was easy for English couples to avail themselves of the mode of contracting marriage allowed by the law of Scotland, which required nothing but a mutual declaration of marriage to be exchanged in presence of witnesses—a ceremony which could be performed instantly—and it was immaterial whether the parties were minors or not. This declaration generally took place in presence of a blacksmith, who in reality was no more necessary than any other witness, but who gradually assumed an authority which imposed on the credulity of the English strangers, and thereby profited by the liberality usually dispensed on such auspicious occasions for his trifling services. The declaration of marriage being exchanged, the parties could return at once to England, and their marriage was held ever after to be valid there and all the world over.

Digitized by Google

These marriages have received much discouragement of late. Not only has the strictness of the English law of marriage been dispensed with, by allowing marriages to be contracted in England in comparative secrecy before the superintendent registrar, without going before a priest, but the Scotch law has also been altered, with a view of checking this evasion of English law. By 19 and 20 Vict. c. 96, no irregular marriage of that kind in Scotland is now valid unless one of the parties had at the date thereof his or her usual place of residence there, or had lived in Scotland for 21 days next preceding such marriage. The effect of this statute is, therefore, an obstacle to runaway marriages from England so far, that one of the parties must at least have resided in Scotland 21 days.

GRÉVY, François Paul Jules, the President of the French republic, was born August 15, 1813, at Vandrez in the Jura, studied law, and became an advocate at Paris. He took part in the revolution of 1830, and in 1848 was returned to the Constituent Assembly. There he held an independent position, but was generally ranked with the extreme left. After Louis Napoleon's *coup d'etat*, G. withdrew from politics, and devoted himself to his professional work. He returned to political life in 1868. After the Franco-German war, he was appointed president of the the National Assembly, a post he resigned in 1873; and after the general election of 1876, he again became president of the Chamber. When, in January 1879, Marshal Macmahon resigned the presidency of the republic, G. who is a thoroughgoing but not extreme republican, was by a large majority elected his successor. G. has never been a blind partisan, and he enjoys the respect and even the confidence of all parties.

GREY, Charles, Earl, K.G., head of the government which carried the Reform Bill, was born March 13, 1764, at Fallowden, near Alnwick. The Greys are a Northumberland family of great antiquity, celebrated for military achievements and first ennobled in the time of Edward IV. The first earl was Sir C. Grey, K.B., a distinguished soldier, who held commands in the first American War, and in the war against the French republic. His son was sent to Eton, and thence to Cambridge. He then visited the continent; and in his 22d year entered the House of Commons as M.P. for his native county. He became a follower of Mr Fox, and his maiden speech was in opposition to the address of thanks to the king for negotiating the commercial treaty with France. He soon obtained a leading position in the House of Commons, and was one of the managers of the impeachment of Warren Hastings. He was also one of the founders of the Society of Friends of the People. In 1793, he was selected to present a petition from this society, in which the defects and abuses of the representative system were forcibly exposed. He was outvoted on this occasion, and again in 1797. In 1799, he opposed the proposal for the Irish union, but recommended the abolition of forty rotten boroughs in Ireland as a means of securing the independence of Irish members. When the Whig administration of Lord Grenville came into office in 1806, G., now Lord Howick, became First Lord of the Admiralty. Mr Fox died in September, and was succeeded by G. as Secretary of State for Foreign Affairs, and leader of the House of Commons. The cabinet was broken up in 1807, but not before it had carried the abolition of the slave trade, and the enlistment of soldiers for a limited period instead of for life. It was unfortunate both for G. and the Whigs, that he was, by the decease of his father in 1807, removed from the House of Commons, where he might have led the opposition, to the Upper House, where his advocacy of measures of progress and amendment found little response. G. and Lord Grenville, as the leaders of the Whig opposition, were more than once desired by the Prince of Wales, after he became Regent, to coalesce with the Tory ministry, but these overtures were firmly rejected. G. actively opposed the bill of Pains and Penalties against Queen Caroline. During the long period in which he remained in opposition, from 1807 to 1830, he gave a strenuous support to the abolition of religious tests, the removal of Roman Catholic disabilities, and the amelioration of the criminal code. The year 1830 was a period of great political disorder and discontent. The French revolution had familiarized the bolder and more ardent spirits with the idea of resistance to the government. Nightly conflagrations in the agricultural districts alarmed the timid. When parliament met in November, G. gave warning of the approaching hurricane, and again urged the adoption of measures of temperate reform. It was in answer to this speech that the Duke of Wellington made his memorable declara-

Digitized by Google

tion against reform, and expressed his admiration of the existing system of representation. This was the death-blow to the Duke's government. Being outvoted on a motion of Sir H. Parnell's on the Civil List, the cabinet resigned, and William IV. sent for G., who formed a Whig government, of which he was of course premier. The Whigs set to work in good earnest to clear away the gross abuses and nests of corruption which had accumulated during nearly seventy years of Toryism; above all, a great, comprehensive, and searching measure of parliamentary reform was prepared by a sub-committee of the cabinet, consisting of Lord J. Russell, Lord Durham, Lord Duncannon, and Sir J. Graham. The bill was brought into the House of Commons, March 1, 1831, by Lord J. Russell, and electrified the nation. It was, however, fiercely opposed in both Houses. General Gascoyne carried a resolution against reducing the number of M.P.'s. G. thereupon advised the king to dissolve parliament. "The bill, the whole bill, and nothing but the bill," was the watchword at the elections; and when the new parliament met, the bill was carried through the Lower House by large majorities. The second reading was moved by G. in the House of Lords, October 3, 1831. After five nights, the bill was thrown out by 199 votes against 158. The reply of the House of Commons was an immediate vote of confidence in the ministers. The king prorogued parliament, in order that, after the shortest possible interval, the bill might be again introduced. Riots took place at Nottingham, Derby, and Bristol. At Birmingham, 150,000 men threatened to march upon London. The metropolis was in a fever of excitement. A second Reform Bill passed the House of Commons, which also passed a second reading in the House of Lords, the Tories being determined to mutilate it in committee. Lord Lyndhurst moved the postponement of the disfranchising clauses, and the Whigs being beaten, G. resorted to the extreme remedy of demanding from the king a new and large creation of peers. The king refused his consent, and G. resigned. The popular excitement increased. The king sent for the Duke of Wellington, but Sir Robert Peel refusing to join the Duke in the attempt to form a government, G. again returned to office, armed with the power of creating as many peers as might be necessary to secure the safety of the bill. On the 4th of June 1832, the Reform Bill passed the House of Lords, and G.'s friends crowded round him to congratulate him on having crowned his long, honorable, and consistent public career by a measure of such immense advantage and importance. G. took office on the principles of peace, retrenchment, and reform. His government, however, lost a good deal of its popularity in England by his deference to the hostility of the Lords, and his attempt to conciliate his opponents by a division of patronage. In Ireland, Mr Stanley's quarrels with Mr O'Connell and the Irish Repealers also tended to weaken the government. Many important measures were, however, passed—the measure for National Education in Ireland, the Irish Church Temporalities Bill, and the bill for abolishing slavery in the West Indies. In December 1834, the Grey ministry fell to pieces on the Irish Coercion Act. G. retired from the post of First Lord of the Treasury with the respect and esteem of the entire nation. A more honorable man never existed. A moral dignity stamped his every action, and over his truthfulness no cloud ever passed. He passed the last ten years of his life in comparative retirement, and died at his family mansion, Howick House, July 17, 1845. His personal appearance was stately and dignified, his gestures were animated, and his tones lofty and sonorous. He left eight sons and four daughters to lament the loss of a most revered parent.

GREY, Lady Jane, an English lady of royal birth and singular misfortunes, was the eldest daughter of Henry Grey, Marquis of Dorset, afterwards Duke of Suffolk, and Lady Frances Brandon. Lady Frances was the daughter of Charles Brandon, Duke of Suffolk, and of Mary, sister of Henry VIII., who had been married to Louis XII., of France, but had become a widow. Lady Jane G. was born at Broadgate, Leicestershire, in 1537. Having discovered, at an early age, surprising talents, she was furnished with an excellent tutor, Aylmer, afterwards Bishop of London, and under his care made extraordinary progress in arts and sciences, and particularly in languages, being able to speak and write Latin and Greek, as well as French and Italian. We have the testimony of Roger Ascham, that he found her reading the "Phædon" of Plato in Greek, while the rest of the family were engaged in hunting. She also sang and played well, and was versed in other feminine accomplishments.

In 1553, after the fall of Somerset, the Dukes of Suffolk and Northumberland, now ruling in the name of the youthful King Edward VI., and foreseeing his speedy death, determined to change the succession to the crown, and secure it to their own families. Lady Jane G., now 16 years old, was therefore married to Lord Guilford Dudley, forth son of the Duke of Northumberland, in May 1553. The king, failing in body, and weak in mind, and surrounded by selfish or fanatical advisers, was persuaded to make a deed of settlement, setting aside the right of succession of his sisters Mary and Elizabeth, and Mary Queen of Scots, leaving the crown to Lady Jane, who was innocent of the conspiracy. After the king's death, her ambitious relatives hailed her as "queen." Lady Jane at first shrunk from honor so treacherously won, but ultimately yielded to the force of their entreaties and commands, and allowed herself to be proclaimed. The people of England resented the unscrupulous conduct of Suffolk and Northumberland, and learned, brilliant, and amiable as Lady Jane was, they rallied, with the true English instinct of loyalty, round Mary. Northumberland was defeated, sent to the Tower, and beheaded 23d August 1553; and in the following November, Lady Jane and her husband were also condemned. For a while, Mary hesitated to pronounce sentence of death against the young couple, but at length she issued the fatal warrant on the 8th of February, and, four days after, both were executed. Lady Jane reigned only ten days. She met her fate with remarkable firmness, making a brief address, in which she confessed the justice of her sentence; but said: "I only consented to the thing I was forced into." Several epistles and other writings attributed to her are extant.

GREY, Sir George, K.C.B., governor and commander-in-chief of New Zealand, was born at Lisburn, Ireland, in 1812. He was educated at the Royal Military College at Sandhurst, and on attaining his captaincy, offered to explore the interior of Australia, then but little known, and on receiving the requisite permission from the Colonial Office, started on his arduous mission in 1837. In September 1838 he organised another expedition to explore the Swan River district. He returned to England in 1840, and began his "Journals of Two Expeditions of Discovery in North-western and Western Australia during 1837–8–9." His enterprise and ability obtained for him, unasked, in 1841, from Lord J. Russell, then Colonial Secretary, the post of governor of South Australia. In 1846, he was made governor of New Zealand. Both here and in Australia, his first task was to acquire the language of the natives, with whom he became more popular than any preceding governor. His government appeared to the authorities at home to be so wise and conciliatory, that in 1848 he was made K.C.B. (civil), and in 1854 was appointed governor and commander-in-chief of the Cape of Good Hope. The task of allaying the asperities and irritation left by the Kaffir war demanded high powers of statesmanship; G. was, however, equal to the occasion. Industry revived, and brighter days began to dawn upon the colony. In 1858, however, the Colonial Office interfered with measures which he considered necessary, and he threw up his post, and came to England. Public opinion at the Cape was so strongly manifested in his favor, that he was requested by the government to resume his governorship. On the breaking out of the Indian mutiny, G. sent every soldier he could spare to the assistance of the Indian government, and received the acknowledgments of the British government and parliament for his promptitude and energy. In 1861 he was again appointed governor of New Zealand, in the hope that he would bring the war then raging there to a satisfactory conclusion. The natives received him with joy and veneration, and he succeeded in bringing about pacific relations with the Maories. He resigned his office and returned to England in 1867, but afterwards went to reside in New Zealand, where he has taken a prominent part in resisting the absorption of the provincial powers by the central colonial government. G. is the author of "Journals of Discovery in Australia" (1841); "Polynesian Mythology" (1855); and "Proverbial Sayings of the Ancestors of the New Zealand Race" (1858).

GREY FRIARS. See FRIAR.

GREYHOUND, a kind of dog distinguished by great slenderness of form, length of limbs, elongation of muzzle, swiftness, and power of endurance in running. There are varieties differing in other less important characters, but these are common to all. They have also prominent eyes and very keen sight, but their scent is

Digitized by Google

not acute, and they pursue their prey not by the scent, like the Hounds (q. v.) properly so called, but by keeping it in view. Some varieties, however, as the *Scottish Greyhound*, probably from being crossed with the staghound or some other of the hounds, combine superior powers of scent with the ordinary qualities of the greyhound. Greyhounds have the parietal bones convergent, not parallel as in the hounds. The face exhibits an almost straight line from between the ears to the nose. The ears are small and sharp, half pendulous in the varieties best known in Britain, but quite erect in some of those of other countries. The chest is deep; the belly much contracted; the paws are small; the hair is long and rough in some varieties, short and smooth in others; the tail is long and slender, curved up at the tip, and in the common smooth-haired greyhounds of Britain and the west of Europe, is covered with hair similar to that of the rest of the body; but there are other varieties with a bushy tail. It is probable that the G. originally belonged to some of the wide plains of Central Asia, or to the north of Africa; it has been very long employed by man as a hunting-dog; it is figured in the monuments of ancient Egypt, and has been common from the earliest historic times in India, Persia, and other countries of Asia, as it has been also in Greece, and generally throughout Europe. To the western parts of Europe, however, there is every probability of its having been brought from the East; and old records shew that a very high value was set upon it. It was long employed chiefly in the chase of deer; and on one occasion Queen Elizabeth was entertained with the pleasant spectacle of "sixteen bucks, all having fayre lawe, pulled down with greyhounds," which she viewed from a turret at Cowdrey Park, in Sussex, the seat of Lord Montacute. The right to possess greyhounds was a proof of gentility; and the effigy of this dog often appears at the feet of monumental figures of knights in armor. The killing of a G., in the good old times, was a felony, punished as severely as murder.

The smooth-haired variety of G., at present so common in Britain, and used for hare-hunting or "coursing," was imported from France, and improved by further importations from Greece, Italy, the north of Africa, and India. The varieties previously in use were rough-haired, and some of them larger and stronger. The *Irish G.*, now almost if not altogether extinct, was large and powerful, so that whilst wolves existed in Ireland, it was used to hunt them. The *Italian G.* is a very small and delicate variety, of gentle manners, well known as a drawing-room pet. Greyhounds do not, however, generally shew the strong attachment to particular persons so common in other dogs; and although so long reduced to the service of man, are inferior to many other dogs in the degree of their domestication. Yet the Grecian and Turkish greyhounds have been trained to stop if a stick is thrown among them when in full pursuit of a doubling hare. A whole pack will thus be stopped, and then one, singled out, will pursue the game.

The fleetness of the G. is well illustrated by an anecdote related in Daniel's "Rural Sports," of a brace of greyhounds in Lincolnshire running after a hare a distance of upwards of four miles in twelve minutes—the increase of distance by turns not being reckoned—when the hare dropped dead.

Various etymologies of the name G. have been proposed, than which none is more probable than that which refers it to the prevalence of a grey color in the breeds once most common. Another derivation is from *Graius*, Grecian.—The *gazehound*, mentioned by old writers, is supposed to be the G., the name being probably given when a pure breed, hunting by sight alone, began to be introduced.

GREYWACKÉ (Ger. *Grauwacke*), a partially translated German word, used as the name of an indurated argillaceous rock, common in, though not confined to, Silurian and Cambrian strata. The great bulk of the Silurian strata of the south of Scotland is composed of this rock.

GRICES, in Heraldry, are young wild boars.

GRIESBACH, Johann Jakob, author of the first critical edition of the New Testament, was born at Butzbach, in Hesse-Darmstadt, January 4, 1745. While G. was still a child, his father was called to St Peter's Church, in Frankfurt-on-the-Maine, where he was also made consistorial councillor. G. accordingly received his first education at the gymnasium of that city, and afterwards studied theology at Tübingen, where the old dogmatic was still predominant; at Halle, where Semler influenced his whole after-life; and at Leipsic, where he became acquainted with Er-

Digitized by Google

nesti. Having resolved to devote himself specially to the criticism of the New Testament text, which had become a favorite study among theologians, G. undertook a journey to various libraries of Germany and Holland, to London, Oxford, Cambridge, and Paris. On his return, he published his "De Codicibus Evangeliorum Origenianis" (1771), and commenced lecturing as *Privat-docent* in Halle. In 1773, he was made extraordinary professor; but in 1776 was called as ordinary professor to Jena, where he continued to teach with great success, and in the enjoyment of many honors, till his death on 24th March 1812. The great work with which his name is associated is his critical revision of the New Testament text. Besides pointing out new sources for the discovery of the original reading, attempting a history of the sacred text ("Curæ in Historiam Textus Epp. Paul.," 1777), and laying down more certain laws of criticism ("Symbolæ Criticæ ad Supplendas et Corrigendas Varias Lectiones N. Test.," 2 vols., 1785—1793), G. was the first who dared to print the New Testament text, as he had been enabled to determine it by his critical science. The first specimen of the revised text that he published was the "Synopsis Evangeliorum" (2 vols. 1774—1775; 2d ed. 1809). This was followed, in 1775—1777, by an edition of the whole New Testament, which was published again in 1796—1806, and of which a re-issue was begun by D. Schulz in 1827, but has never been completed. The second edition has been twice reprinted in London, first in 1809, and again in 1818; an American edition was published at Boston in 1908. Besides smaller editions, a splendid one in 4to was published by Göschen at Leipsic in 1803—1807. G.'s other works, "Populäre Dogmatik" (1779; 4th ed., 1789), "Commentarius Criticus in Textum N. Test." (2 vols., 1798—1811), and the "Opuscula Academica" (2 vols., 1824—1825, edited by Gabler), are now less known. A very competent authority, viz., the eminent Dr Marsh, has pronounced G. to be "the most consummate critic that ever undertook an edition of the New Testament." The grand feature of G.'s critical system is his threefold division or classification of the New Testament MSS. These divisions he called "recensions," or "codices." They consisted of—1. The Alexandrine recension; 2. The Latin or Western recension; 3. The Byzantine or Eastern recension. G. endeavors to shew that the early Fathers, according to their locality, made use of a particular set of MSS., exhibiting certain peculiarities such as justify the above division. G. expressed his decided preference for the Alexandrine recension, both in regard to antiquity and purity; the Byzantine he considered the least trustworthy. Among the most memorable of G.'s triumphs as a critic is his exposure of the interpolation of the well-known passage in defence of the doctrine of the Trinity, 1 John v. 7. His life has been written by Köthe (Jena, 1812), Augusti (Berl. 1813), and by Eichstädt (Jena, 1815).

GRI'FFIN (Fr. *Griffon*, Lat. and Gr. *Gryps*), a chimerical creature, which the fancy of the modern has adopted from that of the ancient world. The G. is first mentioned by Aristeas, perhaps about 560 B. C. (see Liddel and Scott's "Gr. Dic."), though the accounts of Aristeas seem to be about as fabulous as those of the Griffin. See Smith's "Dic. of Gr. and Rom. Biog." The origin of those monstrous conceptions in general, of which the G. is one, has already been considered under Dragon (q. v.). The G. is variously described and represented, but the shape in which it most frequently appears is that of an animal generated between a lion and an eagle, having the body and legs of the former, with the beak and wings of the latter. In this form it appears on antique coins, and as an ornament in classical architecture. Like all other monsters, griffins abound in the legendary tales of the Teutonic nations, and the name in various forms, slightly differing from each other (Ger. "Greif," Dan. "Grif," &c.), is to be found in most Teutonic dialects. Whether in the two cases both the name and the notion might not be traceable to a common source, or whether it was through barbarian or classical channels that they found their way into the nomenclature and the practice of heralds, are subjects on which we do not venture an opinion. Certain it is, however, that there are few fabulous conceptions with which the science of heraldry is more conversant than the griffin. Nor were they regarded by the patriarchs of that science always as mere creatures of the imagination, for incredible as it may seem, we find Gerard Leigh, a herald of great reputation in the time of Elizabeth, talking of them with entire sincerity as existing animals. "I think they are of great hugeness," he says, "for *I have a claw of one of their paws*, which should shew them to be as big as two lions."—See Newton's "Dis-

Digitized by Google

play of Heraldry." p. 126. In the heraldic G., the claws of the eagle are usually substituted for the fore-paws of the lion. Gwl lim blazons a G. in the attitude "rampant," all ging that any fierce animal may be so blazoned as well as a lion. But the more appropriate and usual term is "Segreant." In representing the G., the ears ought not to be omitted, as they indicate the attribute of watchfulness, which, along with strength and swiftness, went to make up the classical conception of his character. See WYVERN.

The name GRIFFIN, in Natural History, is sometimes appropriated, as by Cuvier, to the genus *Gypaëtus*, of which the LÄMMERGEIR (q.v.) is the best known species; whilst in France it is generally bestowed, under the slightly modified form *Griffon*, on the TAWNY VULTURE (*Vultur* or *Gyps fulvus*), also called G. Vulture or Griffon Vulture, a bird which inhabits most of the high mountainous regions of Europe, as well as those of Northern and Central Asia and of the north of Africa. A specimen was caught in the south of Ireland in 1843, the only one that is known to have ever found its own way to the British Islands. The G. Vulture is more than four feet in length; it is of a yellowish-brown color, with darker quills and tail; the head and upper part of the neck covered with short white down, the lower part of the neck surrounded with a ruff of long slender white down. Its habits are very much those common to vultures in general.

GRILLPARZER, Franz, an Austrian dramatic poet, was born at Vienna, 15th January 1790, and first attracted the notice of the public in 1816 by a tragedy, entitled "Die Ahnfrau" (The Grandmother). In 1819 appeared "Sappho," and in 1822 "Das Goldene Vliesz" (The Golden Fleece), which, although they had not much success on the stage, were highly admired as literary productions. The most important of his subsequent works are "König Ottokar's Glück und Ende" (King Ottokar's Fortune and End, 1825), a tragedy regarded by some as in many respects his most masterly piece; "Melusina" (Vienna, 1833); "Des Meeres und der Liebe Wellen" (The Waves of Love and of the Sea, 1840), founded on the story of Hero and Leander, and remarkable not only for its particular beauties, but also for the unusual delicacy and simplicity of spirit characterising it as a whole; and "Der Traum im Leben" (The Dream of Life, 1840), a richly poetical drama. G. also wrote some comedies, and several very beautiful lyric poems, which betray a half-suppressed but genuine love of liberty. He died in January 1872.

GRIGORIO'POL, a town of South Russia, in the government of Kherson, on the left bank of the Dniester, 78 miles north-west from Odessa. It is a fortified town, and regularly built, is inhabited chiefly by Armenians, and has manufactures of silk and cotton stuffs. Its Armenian inhabitants have received large grants of land in the vicinity, but neglect its cultivation, and are chiefly occupied in commercial pursuits. Pop. (1867) 6606.

GRILSE. See SALMON.

GRIMM, Jakob Ludwig, German philologist and antiquary, was born January 4, 1785, at Hanau, in Hesse Cassel. He was educated in classical and legal studies at Marburg, and afterward visited Paris, where he pursued a variety of studies, and assiduously cultivated his taste for medieval literature. On his return to Germany, he was appointed secretary to the minister of war at Hesse Cassel, and become successively librarian of Wilhelmshöhe, and auditor to the council of state. In 1814, he was secretary to the ambassador of the Elector of Hesse, whom he attended at Paris, and at the Congress of Vienna. In 1815, he was appointed a commissioner by the Prussian government to claim the restoration of valuable manuscripts, which had been removed to Paris by the armies of Napoleon I. In 1830 he received the appointment of professor of German literature, and librarian of the university of Göttingen. In this position he devoted seven years to the study of the language, ancient laws, history, and literature of Germany. He was one of seven professors who protested in 1837 against the abolition of the constitution by the king of Hanover, for which act he was outlawed, and obliged to retire to Cassel. In 1841 he was invited to Berlin, where, as member of the Academy, he was entitled to give lectures. He sat as a member of the Assembly of Frankfurt in 1848. Though holding at various times important public offices, his life was devoted to philological and antiquarian studies, and to works which are mines of erudition, and the results of a wonderful industry com-

Digitized by Google

bined with an excessive enthusiasm for everything German. His German "Grammar," in four volumes, the first volume of which was published in 1819, and the last in 1837, is perhaps the greatest philological work of the age; it may be said to have laid the foundation of the *historical* investigation of language. It traces the German language through all its dialects. Some idea of its thoroughness may be got from the fact that the vowels and consonants alone occupy 600 pages. His "Deutsche Rechts-Alterthümer" (Antiquities of German Law, published 1828), and "Deutsche Mythologie" (German Mythology, 1835), are exhaustive works upon the society of the middle ages in central Europe, and the religious traditions and superstitions from the earliest times. His "Geschicte der Deutschen Sprache" (History of the German Language), and "Ueber den Ursprung der Sprache" (On the Origin of Language), are also works of great importance. In company with his brother Wilhelm, he published numerous works of a more popular character, the best known of which is "Kinder und Hausmärchen" (Nursery and Fireside Stories). The greatest joint undertaking of the two brothers (now carried on by other scholars) is the "Deutsches Wörterbuch," begun in 1852, and yet far from completion. Jakob G. died September 1863.

GRIMM, Wilhelm Karl, brother of the preceding, was born at Hanau, February 24, 1786. He was the companion of his elder brother at the Lyceum of Cassel and the university of Marburg. In 1814 he was secretary of the librarian of Cassel, and on removing to Göttingen, in 1830, was appointed under-librarian and supernumerary professor of philosophy. He joined his brother in the protest against the king of Hanover, shared his exile, and also his call to Berlin. They labored together and were commonly known as the Brothers Grimm. Wil. G. died December 1859. Among the works of the younger Grimm are—"Translations of Ancient Danish Heroic Poems of the Sixth Century;" "German Runic Characters;" "Heroic Legends of Germany," &c.

GRIMM, Friedrich Melchior, Baron, an eminent critic of last century, who, during his long residence in Paris, was on terms of intimacy with the most celebrated personages of the day, was born at Regensburg, 25th December 1728. Having completed his studies, he accompanied the young Count de Schönberg to the university at Leipsic, and afterwards to Paris. Here he became reader to the crown-prince of Saxe-Gotha, but the situation proved more honorable than remunerative, and G. was in very straitened circumstances when he became acquainted with Rousseau. The latter introduced him to Diderot, Baron Holbach, Madame d'Epinay, and other persons distinguished by birth and talents, and he soon became a general favorite. His connection with the Encyclopædists (q.v.), and his multifarious acquirements and versatility of mind, soon opened to him a brilliant career. He became secretary to the Duke of Orleans, and now began to write his literary bulletins for several German princes, containing the ablest analysis of all the most important French works. In the composition of these notices, he is believed to have been assisted by the Abbé Raynal and Diderot. In 1776 he was raised by the Duke of Gotha to the rank of baron, and appointed minister-plenipotentiary at the French court. On the breaking out of the Revolution, he withdrew to Gotha, and in 1795 the Empress of Russia appointed him her minister-plenipotentiary at Hamburg, a post which he retained till ill-health obliged him to relinquish it. He returned to Gotha, where he died 19th December 1807. His "Correspondance Littéraire, Philosophique et Critique," was published after his death, in 16 vols. A supplement to this is the "Correspondance Inédite de Grimm et Diderot" (Paris, 1829). It contains a complete history of French literature from 1753 to 1790, and is remarkable for its brilliant and piquant criticism.

GRI'MMA, a small town of Saxony, in the circle of Leipsic, and 18 miles south-east of the town of that name, is attractively situated in a hollow on the left bank of the Mulde. In the middle ages, its importance as a trading town was much greater than at present, and the flourishing manufactures in cloth, flannels, hosiery, cottons, and linens, for which at an early period of its history this town was noted, have now almost entirely disappeared. Among the public buildings are the royal castle, now used as a court-house, and the ancient town-hall. Pop. (1875) 7270, who support themselves by manufactures and agriculture.

GRIMM'S LAW, the name—derived from the discoverer, J. Grimm (q. v.)—given to the principle which regulates the interchange of the mute consonants in the cor-

Digitized by Google

responding words of the different Aryan languages. A historical survey of this family of tongues shews the consonants to go through a cycle of changes (Ger. *Lautverschiebung*). What, for example, was a *p* in the original form of a word, or, at least, in the oldest form known, is found at a later stage transformed into *f*, which next passes into *b*; and this again tends to become *p*, and go through the cycle anew. The following table exhibits the transitions that manifest themselves in regard to the Greek, Gothic, and Old High German:

	Labials.			Dentals.			Guttnrals.		
Greek (Latin, Sanscrit), . . .	p	b	f	t	d	th	k	g	ch
Gothic, ...	f	p	b	th	t	d	k	g	
Old High German, ...	b (v)	f	p	d	z	t	g	ch	k

There are of course many exceptions, arising from the influence of adjoining letters and other accidental causes. The following are examples of the law:

Sanscrit.	Greek.	Latin.	Gothic.	Old High German.
Pâda-s	pod-os	pedis	fôtus	vuoz
Pitri	pater	pater	fadrein (pl.)	vatar
bhri	phero	fero	baira	piru
tvam	tu	tu	thu	du
trayas	treis	tres	threis	dri
pagu	poû	pecus	faihu	vihu

It is in the High German dialects that the action of this principle is most marked. In the Teutonic tongues of the "low" type, of which English is one, the consonants have remained at the same stage of development they had attained in the Gothic (e. g. Eng. *father, foot, bear, three*); the Old High German exhibits a third stage; and in modern High German the principle seems still at work, although its development is hindered by the crystallising effect of written language.

GRI'MSBY, Great, a parliamentary and municipal borough, seaport and market-town of England, in the county of Lincoln, is situated on the right bank of the Humber, 40 miles north-east of the town of Lincoln. It consists of two portions—the older, comprising a number of streets irregularly laid out, is at the head of the harbor; and the newer part, called the "Marsh," extends along the east side of the harbor, and is regular and spacious. The parish church, a good specimen of the English pointed style, is an elegant cruciform structure, with a tower containing eight bells rising from the centre. Among its institutions, G. has a free grammar-school, a national school, and other educational establishments; a mechanics' institute, and a new town-hall. There are here an extensive and commodious suite of docks, opened in March 1852, and spacious enough to receive the largest ships of war; several ship-building yards, mills, and a tan-yard and brewery. G., however, is now chiefly famous for its immense fishing trade. In 1875, 2543 vessels, of 438,520 tons, entered, and 2071, of 608,898 tons, cleared the port. The commerce of G. is benefited by its being the terminus of the Great Northern and of the Manchester, Sheffield, and Lincolnshire Railways. It sends one member to the House of Commons. Pop. in 1871 of the municipal borough, 20,244; of the parliamentary borough, 26,982.

G. was formerly a port of such importance that, in the reign of Edward III., it sent eleven ships to aid that monarch in his expedition against Calais. But the gradual silting up of the harbor reduced it to comparative insignificance. Its present prosperity may be said to date from the beginning of this century, when measures were first taken to improve the harbor.

GRI'NDELWALD, one of the most beautiful of the high Alpine valleys, at a distance of 35 miles from the city of Bern, is about 12 miles long and 4 miles broad. G. owes its celebrity as a resort for travellers to two great glaciers, branches or arms, as it were, of the immense ocean of ice which covers the Bernese Oberland. The village of G., consisting of a number of widely scattered cottages, with about 3500 inhabitants, is about 3600 feet above sea level.

GRINDING, the operation of shaping any hard substance by rubbing away its surface with a rough stone or with a cutting powder. It is similar to filing, and is used in cases where, from the hardness of the material, or for other reasons,

Digitized by Google

filing is inapplicable. Thus cutting-tools and other steel instruments may be filed before hardening and tempering; but after this if further abrasion is required, they must be ground. Glass lenses and metal specula are ground to shape with emery-powder laid upon a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap-wheels. Diamonds and other gems are ground or cut with diamond-dust imbedded in soft iron. When large flat surfaces are required, they are obtained by first working two pieces of the substance nearly flat, and then laying one upon the other, and grinding their surfaces together with sand, emery, or other suitable cutting powder. Plate-glass is flattened in this manner; also surfaces of cast iron where accurate fitting is required, the iron surface being either prepared with a planing-machine, or by turning in a lathe with a slide-rest. Sockets and other bearings which require to be fitted with great accuracy are usually finished by grinding together. For brass and bell metal powdered pumice-stone is best adapted for such purposes, as emery is liable to imbed itself in the metal, and give it a permanent cutting action upon the bearings.

Dry grinding is the term applied to the grinding of steel with dry grindstones. Its principal applications are in the grinding of the points of needles and forks, the surfaces of gun-barrels, and in finishing steel-pens. This kind of work produces painful irritation in the throat and nostrils of the men and women who follow it; and although the distressing effects have been very much diminished of late by the introduction of currents of air to carry away the particles of steel, and mouth-pieces of damp cloth, the evil is not entirely obviated; in some branches, such as gun-barrel grinding, it is still very great. Besides this evil, the stones used for gun-barrel grinding, which are very large, revolve with great rapidity, and occasionally break with great force while revolving, and seriously endanger the lives of the men.

Another kind of grinding, quite distinct from the above, is that of crushing and rubbing a substance into a fine powder. This is effected by passing the substance between rough stones, as in the common flour-mill, or between rollers, either smooth or toothed, according to the degree of fineness required, or by a heavy stone or iron cylinder revolving upon a smooth plate. Colors are ground in small quantities with a *muller and slab*. The muller is a heavy piece of stone of somewhat conical shape, and which rests on its base upon the slab of stone, and is grasped by the hands, and the color is mixed to a pasty consistence with the required medium of oil or water, and rubbed between the two surfaces until smooth and impalpable. On a larger scale, iron or stone cylinders revolve on a slab in such a manner that they shall not merely roll but shall also rub upon the surface of the slab. A knife or scoop follows one cylinder and precedes the other, scooping the paste into the position required to come fairly under the cylinder which follows it. Chocolate, spices, plumbago for crucibles, and a variety of other substances, are ground in this manner.

GRINDSTONES. Flat circular stones made to revolve upon an axis, and used for grinding steel, glass, other stones, &c. They are made of sandstone or sand-stone grit, of various degrees of coarseness, according to the purpose for which they are to be used.

GRIPING, or Gripes, a popular name for all painful affections of the bowels, whether attended with Constipation (q. v.) or Diarrhœa (q. v.). When pains of this kind are spasmodic, they are termed Colic (q. v.). The action of purgative medicine is often attended by more or less of griping pain, which may be averted in certain cases by the careful choice of the medicine, or by combination of it with Carminatives (q. v.), or with a little opium.

GRIPPE, a French name for Influenza (q. v.).

GRI'QUALAND, a tract of country in South Africa, to the northeast of Cape Colony, lying about the junction of the Orange and Vaal Rivers to the west of the Orange River Free State. It derives its name from its inhabitants, the Griquas or Bastaards, a race sprung from the intercourse of Dutch settlers with Hottentot and Bush women. The area and population are uncertain. Some of the inhabitants are successful farmers, and there is a thriving settlement, Griqua Town, under the care of the London Missionary Society. *Griqualand West* has of late years become famous from the discovery of the Cape diamond fields, which are situated within its bounds. The first diamond was found in 1867, and since 1870 a strong tide of immigration has flowed unceasingly. Various settlements were formed, digging was vigorously

Digitized by Google

prosecuted, and all nationalities were represented. The territory in which the diamond fields lie had been secured to a native chief, Waterboer, by the British government, but both the Orange River Free State and the Transvaal Republic contested his boundaries, and the result was constant disturbances at the diggings. At length, in October 1871, the British government of Cape Town issued a proclamation declaring Griqualand West British territory, and annexing it to Cape Colony. This was done with the assent of Waterboer, whose interests were not neglected. The principal settlements are Du Toit's Pan and De Beer. Pop. (1872) 25,477; area about 17,800 sq. m. *Griqualand East* was incorporated with Cape Colony in 1874.

GRISE'LDA, or Griseidis, is the heroine of a celebrated medieval tale, which probably had its rise in Italy. A poor girl, who was a charcoal-burner, was raised to be the wife of the marquis of Saluzzo, who put her humility and obedience to the severest tests. She, however, passed through them all triumphantly, and a reconciliation took place. In this legend, the endurance and self-renunciation of the loving woman are represented as carried to the highest pitch. We find the tradition first worked up into a tale, said to be founded on fact, in Boccaccio's "Decameron;" Petrarch translated it into Latin in 1373, under the title "De Obedientia, et Fide Uxoria;" and in the 14th c., the story was well known throughout Germany. In the year 1393, it was worked up into a "mystery" play in Paris; in England, the drama of "The Patient Grissel" appeared in 1599, and one on the same subject by Hans Sachs in Germany in 1546. Versions of the story are also found in the literatures of Holland, Bohemia, Sweden, Iceland, &c. The old German people's book, entitled "Markgraf Walther," has lately been reproduced with more or less fidelity in Schwab's "Buch der Schönsten Geschichten und Sagen," Marbach's 'Volksbücher," and Simrock's "Deutschen Volksbücher."

GRI'SI, Giulia, a celebrated vocalist, was born at Milan in 1810. From a very early period, she evinced the most remarkable musical genius, accompanied by a voice of the rarest promise. At the age of 16, she first appeared in the opera of "Zelmira," at Bologna, and gathered her earliest laurels by the inimitable quality, melodiousness, and fidelity of her voice, as well as by her pathetic and lifelike impersonation of the rôle. Two years later, she appeared at Florence, and to no artist was pre-eminence ever more unanimously accorded. Her greatest triumph, however, was obtained at La Scala, Milan, where she played the part of Norma in the tragic opera of that name. So thoroughly did she identify herself with this character, that hardly any subsequent singer has ventured on an original and independent personation. G.'s début at Paris in 1832 was equally successful, and overcame the proverbial cynical apathy of the frequenters of the Théâtre Italien. London, however, was the scene of her grandest performances, and most appreciating audiences. G. was twice married, first, unhappily, to Mons. Gérard de Melcy, and secondly, to Signor Mario, the eminent tenor. She died in 1869.

GRIS-NEZ, or Grinez, Cape, a headland of France, in the department of Pas-de-Calais, opposite Dover, is the point of land nearest to the English shore, the distance being barely 21 miles. Cape G. is about equally distant from Calais on the north-east and Boulogne on the south. It is surmounted with a light-house, the lat. of which is 50° 52' n., and the long. 1° 35' e.

GRI'SONS (Ger. *Graubünden*), the largest and the most thinly peopled of all the cantons of Switzerland, is bounded on the n. by St Glarus, St Gall, and the Vorarlberg; on the e. by the Tyrol; on the s. by Lombardy; and on the w. by Uri and Ticino. Its area is 2673 square miles; its population (1870), 91,782, of whom 39,848 are Catholics. The canton divides itself naturally into three great valley-districts, of which the first and most important lies along the course of the Rhine, and stretches northward, occupying nearly the whole of the western portion of the canton; and the second, forming the Engadine (q. v.), extends north-east along the course of the Inn. The third valley-district comprises several smaller valleys whose streams run southward, belonging to the basins of the Ticino and the Adda. The whole canton is an assemblage of mountains intersected by narrow valleys. The climate is very varied, in some districts winter reigns for nearly eight months, while some of the southern valleys resemble Italy. In the colder districts, scanty crops of barley and rye are raised with difficulty; while in the southern valleys, wheat, maize, and also the vine, fig, and almond are successfully cultivated.

Digitized by Google

Pastures and forests occupy a large portion of the canton; and cattle, timber and cheese are the principal exports. Iron, lead, copper, zinc, and silver are worked. The rivers abound in salmon and trout, and in the mountains are bears, wolves, lynxes, and wild cats.

The country was anciently inhabited by the Rhætii, who are by some connected with the Etruscans (See ETRURIA). It was conquered by the Roman emperor Constantius in the 4th c., and his camp (*Curia*, *Chur*, or *Coire*, the name of the present capital), was planted on the Rhine. Chur has been a bishopric since 450 A.D. In the 10 c. the country of the G. was added to the German empire, and remained till 1268 subject to the Swabian dukes. With the decay of the imperial authority, it came to be oppressed by a numerous nobility, the ruins of whose castles still crown the heights. Against them the people began, in the end of the 14th c., to form leagues in the different valleys. One of these leagues, formed in 1424, was called the *gray* league (Ger. *der graue bund*; in the native language, *lia Grischa*), from the gray home-spun worn by the unionists, and hence the German and French names of the canton—Graubünden and Grisons. In 1472, these separate unions entered into a general federation, which then formed an alliance with the Swiss cantons. It was not till 1803 that G. was admitted into the Swiss confederation as the 15th canton. The constitution of G. is very complicated, and suffers from the want of centralisation incident to its origin. Of the inhabitants, one-half speak German, and the others dialects derived from Latin. The dialects of the southern valleys are a kind of Italian; the Latin of the Engadine (q. v.), and the Romanese differ greatly from Italian, but are far from being Latin.

GRIT is a coarse-grained sandstone, the particles of which are more or less angular, and compacted together by a hard siliceous cement. See MILLSTONE GRIT.

GRIVEGNÉE, a town of Belgium, in the province of Liege, and about two miles south-east from Liege, on the right bank of the Ourthe. Steam-engines and other machinery are extensively manufactured; also nails, copper wire, and strings for musical instruments. G. has brickworks, and worsted and fulling mills. There are coal-mines in the vicinity. Pop. 6234.

GROAT (Dutch, *groot*, Ger. *groschen*, Fr. *gros*, Ital. *grosso*, Low Lat. *grossus*, from the same root as Eng. *great*, and meaning *thick*), a name given in the middle ages to all *thick* coins, as distinguished from the "bractentea" (Lat. *bractea*, a thin plate or leaf), or thin coins of silver or gold-leaf stamped so as to be hollow on one side and raised on the other. Groats differed greatly in value at different times and in different countries. The silver groat once current in England (introduced by Henry III.) was equal to four pence. The coin—though not the name—has been revived in the modern fourpenny-piece. Groschen were till lately current in the north of Germany. The silver groschen, or neugroschen of Prussia and the Zollverein, was 1-30th of a thaler, and worth 1½d.; the guter groschen of Hanover = 1-24th thaler = 1¾d.

GROATS (also locally *grits*, from the same root as *to grate*, to rub to powder; allied to Eng. *scratch*, and Lat. *rado*, to scrape), the grain of oats deprived of the integuments. Groats are much used for preparing *gruel* for invalids, and were formerly also often used in broths and soups like pot-barley.—*Embden Groats* are groats broken into small pieces by crushing.—Concerning the nutritive and other qualities of groats, see MEAL and OATS.

GRO'DEK, or Grudek, a town of Austrian Gallicia, 15 miles west-south-west of Lemberg, with which it is connected by railway, is situated partly on a hill between two small lakes, and partly on three small islands. Pop. (1869) 8000, consisting chiefly of German colonists, but including also a number of Jews.

GRO'DNO, a government of Russia, in the province of West Russia, and formerly a portion of Lithuania, is bounded on the n. by the government of Vilna, on the e. by that of Minsk, on the s. by Volhynia, and on the w. by Poland and the province of Bialystok. It has an area of 14,532 square miles, and a pop. of (1870) 1,008,521. The land is, in general, flat, and belongs in the south-west to the basin of the Vistula, in the north to that of the Niemen, and in the south-east to that of the Dnieper. In the south, extensive morasses occur, although much marshy land has been already converted into pasture-ground by draining; and in the north are extensive forests, chiefly of pine. The soil is light and sandy (except that of the river-valleys, which

Digitized by Google

is clayey), and is in general fruitful. Rye is the principal agricultural product, the average annual yield being estimated at 2,846,000 English quarters. Barley, flax, hemp, hops, and timber are also extensively raised. The bear, the lynx, and the buffalo are found in the forests. Cattle, sheep, and bees are largely reared. The chief branches of industry are the manufactures of cloth, hats, paper, and leather, and the principal exports are corn, cattle, wool, leather, hops, honey, and wax.

GRODNO, a town of Russia, capital of the government of the same name, is situated on an elevation on the right bank of the Niemen, 160 miles north-east of Warsaw. It has fourteen churches and convents, several synagogues and castles, some ruinous palaces, belonging formerly to old Lithuanian families; a gymnasium: manufactures in cloth, silk, and weapons; and a flourishing trade, which is almost wholly in the hands of the Jews, who form about three-fourths of the population. The modern palace, erected here by Augustus III., is an extensive and handsome edifice. The other principal buildings are the market-place, the equestrian seminary, the high school, the academy for medical science, connected with which are a library, collection in natural history, and a botanic garden. Here, in 1586, Stephan Bathori died in his own castle; and here, 25th November 1725, Stanislas Augustus abdicated the Polish crown. Pop. (1867) 24,789.

GROG, the name applied in the navy to the mixture of rum and water served out as a beverage to the men. Under recent regulations, men who prefer abstaining from grog are allowed to receive money or tea in lieu thereof. Forced potations of *six-water grog*, consisting of one part rum to six parts of sea-water, are administered occasionally, by way of punishment for dirtiness and some other offences. The quaint name of *grog* is said to be derived from a nickname of Admiral Vernon, who introduced it into the service. In bad weather, he was in the habit of walking the deck in a rough *grogram* cloak; the sailors thence called him *Old Grog*, and then transferred the name to the drink.

GROINED VAULTING is that kind of vaulting in which the vault is not a plain barrel-vault from end to end, but where one vault cuts into another. The angle formed by the intersection is called the groin. In Roman architecture, the groins were generally left as a plain sharp edge; in Gothic, they were usually protected and strengthened with *ribs*. See VAULT.

GROMWELL (*Lithospermum*), a genus of plants of the natural order *Boragineæ*, having a funnel-shaped corolla, stamens shorter than the corolla, and *achenia* of stony hardness. Probably, on account of the last-mentioned character, extraordinary virtues were formerly ascribed to them, particularly to the COMMON G. (*L. officinale*), in the cure of stone in the bladder, which, however, were wholly imaginary. The Common G. is a native of dry gravelly places in Europe, Asia, and North America. It has an erect, much-branched stem, broadly lanceolate leaves, and small greenish-yellow flowers.—CORN G. (*L. arvense*) with small white flowers, is more plentiful in Britain, and is of equally wide geographic distribution.—Two species, natives of the south of Europe, *L. tinctorium* and *L. anchusoides*, yield a dye-stuff similar to alkanet, and which passes under that name.

GRO'NINGEN (anc. *Cruoninga*), the most north-eastern province of the Netherlands, is bounded on the n. by the North Sea, on the e. by Hanover, on the s. by the province of Drenthe, and on the w. by that of Friesland. It has an area of 896 sq. miles, and on 31st Dec. 1873, its population amounted to 282,739. It is watered by the Hunse, which is navigable for large vessels from the town of Groningen to its mouth in the Lauwer Sea, by other small streams, and by lakes and numerous canals. Its surface is flat, and is protected against the sea on the north by dykes. The soil, which is principally alluvium, forms excellent arable land. The north of the province contains the best soil, and is one of the most densely peopled districts of the kingdom. A considerable portion of the land (towards the south-east) is marshy, and lies in pasturage, which supports a fine breed of cattle, and great numbers of highly valued horses and sheep. Farming and grazing are the chief pursuits of the people; fishing, commerce, and trade are also carried on, as well as manufactures to some extent. Ship-building is extensively followed, and much butter exported. The people are almost entirely of the Frisian race, and belong chiefly to the Reformed Church.

Digitized by Google

GRONINGEN, an important fortified town of the Netherlands, capital of the province of the same name, is situated on the Hunse, at the confluence of the Aa with that stream, 22 miles west of Dollart Bay. It is nearly circular in form, surrounded by walls and a fosse, and traversed by canals crossed by 18 bridges. The Hunse is here converted into a canal, and is navigable for large vessels, about 600 of which visit the town annually. The great market-place is 662 feet long and 389 feet broad, and contains the beautiful Gothic church of St Martin's, with a noble tower 343 feet high. The university, founded in 1614, possesses a library, a botanic garden, and a cabinet of natural history. G. has railway communication with Friesland, Germany, and southwards to all the Netherlands towns. The port of G. is good; it communicates by means of canals with Dollart Bay on the east, with the Lauwer Sea on the north-west, and with the entrance to the Zuider Zee at Harlingen on the west. There are ship-building yards and paper-mills. Pop. (31st December 1873) 39,284.

GROO'TÉ EY'LANDT (English, *Great Island*) lies off the western coast of the Gulf of Carpentaria, in North Australia, and is the largest island in that vast inlet, in lat 14° s., and long. 136° 40' e. Its extreme length and breadth are about 40 miles each. The centre is mountainous, and the shores are dry and barren.

GROS, Antoine Jean, Baron, a French historical painter, was born at Paris on 16th March 1771, studied in the school of David, and first acquired celebrity by his picture of Bonaparte as the victor of Arcola. The latter was so much pleased with the work, that he appointed G. a member of the commission charged with collecting the objects of art which had been ceded to France by the treaty of Tolentino. His first great achievement, however, was the "Pestiférés de Jaffa" (The Plague-smitten at Jaffa), which was executed at Versailles in 1804. It excited prodigious enthusiasm, the author being carried in triumph to the saloon of the Louvre, where the picture was crowned in his presence. Other important works executed by G. during the Consulate and the Empire are: "Bonaparte aux Pyramides," "Le Combat d'Aboukir," "La Bataille de Wagram," "Charles-Quint reçu à Saint Denis par François Ier." After the return of the Bourbons, G. painted, among other pictures, "Le Depart Nocturne de Louis XVIII. au 20 Mars 1815," "La Duchesse d'Angoulême s'embarquant à Pauillac," and "Charles X. au Camp de Reims." Besides these, he finished, in 1824, an immense work for the cupola of the church of Sainte-Geneviève in Paris, begun in 1811, to which, say his countrymen, "there is nothing comparable." It is not a fresco, but a painting executed in oil upon a peculiar kind of plastor, representing the four great dynasties of France doing homage to the tutelary genius of the nation. Charles X. was so charmed with the work, that he raised G. to the dignity of a baron, and doubled the sum which the painter had originally stipulated for. The rise of the romantic school bore away from him the tide of popularity, and G. felt the ebbing of his fame so acutely, that it is suspected he committed suicide in a fit of profound chagrin. At all events, his body was drawn out of the Seine near Meudon, 26th June 1835. G.'s paintings are all marked by strength of effect, and dramatic movement in the scene; they are, however, deficient in delicacy and sentiment, and exhibit a very ordinary power of imagination.

GRO'SBEAK (*Coccothraustes*), a genus of birds of the family *Fringillidæ*, distinguished chiefly by the great thickness of the bill, which has also a proportionate strength, and notwithstanding the small size of the birds, is used for breaking the stones of cherries, olives, &c. The Hawfinch (q. v.) and Greenfinch (q. v.) are the British species, nor are there any others in Europe; but some are found in other parts of the world, as the beautiful EVENING G. (*F. vespertina*) and the ROSE-BREASTED G. (*F. Ludoviciana*) in North America.

GRO'SSENHAIN, or Hain, formerly also called Markgrafenhain, is a small manufacturing town of Saxony, situated on the left bank of the Röder, 20 miles north-west of Dresden. It is famous for its woollen and cotton manufactures. Pop. (1871) 10,438.

GROSSETESTE, Robert, a celebrated English prelate of the middle ages, was born at Stradbrook, in Suffolk, in the latter part of the 12th c. He studied at Oxford, and subsequently at Paris. On his return to England, he obtained a great

Digitized by Google

reputation as a divine, and was the first lecturer in the Franciscan school at Oxford. In 1235, he was elected Bishop of Lincoln, and at once commenced in the most vigorous fashion the reformation of abuses in his diocese. The most conspicuous and offensive ecclesiastical sin in G.'s days, was the conduct of the pope (Innocent IV.) in the matter of church appointments. It was common for His Holiness to make grants of vacant benefices in England to Italians, and other foreigners, many of whom, it would appear, never shewed face in this country at all, but contented themselves with drawing the revenues of their office. This was intolerable to a man like G., and he set himself strongly against it, incurring, by his boldness, a temporary suspension from the exercise of his episcopal functions, and a continual menace of excommunication. One of these transactions in the year 1253 has been the subject of much controversy. It is alleged by some writers that Innocent wrote to G., ordering his nephew, an Italian youth, to be promoted to the first canonry that should be vacant in the cathedral of Lincoln, accompanying his injunctions with threats. The bishop was filled with indignation, and at once addressed a letter either to the pope or his agents, in which he declares, that "if an angel from heaven commanded him to obey a mandate so absurd and sinful, he would not do it," and compares the nepotism of the pope to the sin of Lucifer and Anti-Christ. Innocent, according to these writers, was violently enraged at his opposition; he excommunicated G., and even appointed a successor to the bishopric, but in this instance the thunder of the Vatican was harmless. G, quietly appealed to the tribunal of Christ, and troubling himself no more about the matter, continued to discharge his episcopal functions. The general feeling of the English nation sustained him; the clergy of his diocese went on obeying him as if nothing had happened; and at his death, October 9, 1253, Archbishop Boniface conducted the funeral services. But Dr Lingard (ii. p. 502) has shewn that the mandate came not from the pope, but from the nuncio; that Innocent, on receiving G.'s reply, not only rescinded the order, but adopted measures for the reform of these abusive appointments; and that the story of his having died under a sentence of excommunication rests on very questionable authority. G. is commonly regarded as one of the "reformers before the Reformation." It is assumed that because he quarrelled with the head of the church on a matter of discipline, he must have been a "Protestant." But nothing could be further from the fact than such an assumption. He belonged to that class of minds who look at truth not from the side of *doctrine*, but of *practice*. He would have accepted, with acquiescence, any new doctrine from the Vatican, but a knavish trick was not to be endured, even at the hands of an angel from heaven! It is in the last degree futile, therefore, to claim him as a precursor of men like Luther, or Calvin, or Knox. In politics, he was a constitutionalist, and a friend of Simon de Montfort, heartily interested in the preservation and extension of such liberty as England then enjoyed. His learning was prodigious, almost inspiring awe among his contemporaries. Latin, Greek, Hebrew, French, mathematics, medicine, and music were among his attainments. His knowledge of the Scriptures is also particularly lauded. G. was one of the most voluminous authors that England ever produced. The list of his works, as given by Dr Pegge, of which only a few have been published, occupies 25 closely-printed pages in quarto. For an intelligent estimate of his life and character, see Mr Brewer's "Monumenta Franciscana," and the collection of his letters edited by Mr Luard, and published (1862) under the title, "Roberti Grosseteste Episcopi quondam Lincolniensis Epistolæ."

GROSSE'TO, a town of Central Italy, capital of the Maremma (q. v.), on the Ombrone, about 10 miles from its mouth, and 70 miles south of Florence. The town is very unhealthy, but it is well built, and is regularly fortified, the walls forming a pentagon with brick bastions and two gates. It is the seat of a bishop, has a fine cathedral, two convents, hospital, &c., and in the centre of the square a colossal statue of Leopold II. There are manufactures of silk and woollen goods, glass, &c. About 6 miles from G. are the ruins of the very ancient Etruscan city *Rusellæ*, the Cyclopean walls of which may still be traced. It was at one time so powerful as to be one of the twelve cities of the Etruscan league. Pop. 3000.

GROSSULARIA'CEÆ, a natural order of exogenous plants, containing about 100 known species, all shrubs, natives of temperate climates, and chiefly of the

Digitized by Google

northern hemisphere. They have alternate lobed leaves. The calyx is 4—5-cleft, the tube entirely or in part adherent to the ovary; the petals are very small, alternate with the segments of the calyx; the stamens are alternate with the petals, and inserted into the throat of the calyx; the ovary is one-celled, with two opposite parietal placentæ; the fruit is a berry crowned with the remains of the flower, having numerous seeds immersed in pulp, and suspended by long threads; the *testa* externally gelatinous, adhering firmly to the horny albumen. The most important species of the order are the Gooseberry (q, v.) and Currants (q. v.).

GROSSWA'RDEIN (Magyar, *Nagy-Varad*), a town of Upper Hungary, in the county of south Bihar, is situated in a beautiful plain, on the Sebes Körös ("the rapid Körös"), 88 miles south-south-east of Debreczin. It is the seat of a Roman Catholic, and of a non-united Greek bishop, and consists of the town G. proper, and eight suburbs. The town is surrounded by a wall, and was formerly a fortress. The principal buildings are the churches, of which there are 22, including the cathedral, a magnificent edifice. A great trade is carried on here, especially in pottery, in cattle-rearing, and in the cultivation of the vine. There are several distilleries. The town is connected by railway with Vienna. The entire population of this town in 1869 was 28,696. G. was taken and pillaged by the Turks in 1660, and by the Austrians in 1692.

GROTE, George, politician, historian, and philosopher, was born 1794 at Clay Hill, Beckenham, Kent. His grandfather, Andrew Grote, a native of Bremen, settled in London in the beginning of the last century, and, in conjunction with Mr G. Prescott, founded the London banking-house that still bears their joint names. His mother, Selina Mary Peckwell, was the daughter of the Rev. Dr Peckwell, chaplain to the Countess of Huntingdon, who married an Irish lady, descended from an old French family in Touraine, one of whom, being a Protestant, settled in this country after the revocation of the edict of Nantes. G. was educated at Charter House, and at sixteen entered his father's banking-house, employing all his leisure hours in study. In 1823, he began to amass materials for a history of Greece. Previous to 1832, he wrote on parliamentary reform, and threw himself into the agitation for the Reform Bill. After the passing of the bill, he was elected, at the top of the poll, a representative of the city of London in parliament, and continued a member of the House of Commons till 1841. His parliamentary career was chiefly distinguished by his annual motion for the ballot, but he spoke with great effect on many other questions. In 1843, he retired from the banking-house, and devoted himself exclusively to his history; the first two volumes appeared in 1846, and the last (twelve volumes in all) in 1856. He forthwith commenced the study of Greek philosophy, and in 1865 brought out his work on Plato. The remainder of his studious life was devoted to Aristotle, but he did not execute more than a part of what he intended. He died in 1871. After his death, appeared what he had composed on Aristotle; also a collection of essays, entitled "Minor Works," and, in 1876, "Fragments on Ethical Subjects." "The Personal Life of George Grote" was written by Mrs Grote. He spent much of his time, in later years, in the management of the great unsectarian educational institutions—University College, and the University of London—being, at the time of his death, president of the one, and vice-chancellor of the other. His whole career was marked by attachment to liberal opinions. He was not merely a man of erudite research; he devoted himself also to mental philosophy and logic, by which he became as much distinguished in his capacity of historian of philosophy as he was in political history.

GROTE'SQUE, a style of classical ornament, so called, in the 18th c., from its having been rediscovered in the excavations made in the baths of Titus and other ancient Roman buildings, the Italian word *grotto* applying to any subterranean chamber. This light, fantastic style was much in favor during the Renaissance. It abounds in all kinds of transformations, from the animal to the vegetable, and mingles all the natural kingdoms in the most fanciful and picturesque confusion. The name *grotesque* thus came by degrees to mean a fanciful combination of natural ideas as applied to ornament. Thus, all the picturesque animal and vegetable *inventions* of the medieval artists are grotesques. Some of these are very beautiful, and others very picturesque, and, generally, an idea of some value, such as boldness, fierceness, dignity, &c., is expressed. In this mode of application, the grotesque is

Digitized by Google

a valuable quality in art; it is only when it becomes debased, as in the monstrosities of the Renaissance, that its value is lost.

GRO'TIUS, Hugo, or De Groot, was born at Delft, 10th April 1583. His father, Jan de Groot, was burgomaster of the town, and also curator of the university of Leyden. In his 11th year he entered the university of Leyden, where he enjoyed the advantage of study under Joseph Scaliger. In his 15th year he took his degree. In the following year he accompanied Olden Barneveldt, the grand pensionary, on his embassy to France, where, notwithstanding his extreme youth, his talents and conduct gained him the favor of Henry IV. On his return, he began to practise as a lawyer; and in 1607 was appointed fiscal-general, and in 1613 council-pensionary at Rotterdam. But the disputes between the Remonstrants and their opponents were now at their height in Holland; Olden Barneveldt had the misfortune to be the protector of the former, and G. also supported them by his writings and favor. These religious, or rather theological strifes had, however, a *political* significance also; and the consequence was, that both Olden Barneveldt and G. were arrested, tried, and condemned by the dominant party under Prince Maurice (see BARNEVELDT). Olden Barneveldt was beheaded in 1619, and G. sentenced to imprisonment for life in the castle of Lovenstein. He escaped, however, by the contrivance of his wife, who managed to have him carried out of the castle in a chest used for the conveyance of books and linen, while she remained in prison in his stead. Her devotion was applauded even by his stern masters, and she was set at liberty.

For some time G. wandered about in the Catholic portion of the Netherlands, and finally escaped to France, where Louis XIII. bestowed on him a pension of 3000 livres; but not paying sufficient court to Richelieu, he lost the king's favor, and in 1631 his pension was withdrawn. A friendly letter from Prince Frederick of Orange induced him to return to his native country; but by the intrigues of his enemies, sentence of perpetual exile was soon passed upon him. He now removed to Hamburg, and, while there, he received invitations from the kings of Denmark, Poland, and Spain; but the protection promised him by the Chancellor Oxenstiern, and Queen Christina's taste for literature, induced him to enter the Swedish service in 1634. As ambassador at the French court (1635—1645), he gained universal respect. On his return to Sweden, he passed through his native country, and was received in Amsterdam with the most distinguished honor. Equally flattering was his reception by the Swedish queen; but the literary dilettantism of Christina's court did not suit so serious and solid a scholar, whose thoughts were always of the broadest and most forecasting nature. Besides, the climate of Sweden did not agree with him, and he was probably anxious to spend the evening of his life in his native land. In consequence, he sent in his resignation of office to the queen, who, when she found that nothing could induce him to stay, presented him with a sum of 10,000 crowns, and some costly plate, besides placing at his disposal a vessel to conduct him down the Baltic to Lübeck. A storm compelled him to land on the coast of Pomerania. While proceeding towards Lübeck, he was seized with a fatal illness, and died at Rostock, 28th August 1645. To the talents of a most able statesman, G. united deep and extensive learning. He was a profound and enlightened theologian—perhaps the best exegete of his day, a distinguished scholar, an acute philosopher, a judicious historian, and a splendid jurist. Altogether, he was what Menage called him, "a monster of erudition." His metrical translations from the Greek authors also display superior poetical powers; he was one of the best modern writers of Latin verse, and likewise composed poems in the Dutch language. In spite of his broken, wandering, and checkered carreer, G. found time to write a great variety of works. The first was the "Mare Liberum," in which he defended the freedom of the Dutch East India trade. His chief work, however, is that entitled "De Jure Belli et Pacis," which has been translated into all the languages of Europe. It may be considered as the basis of international law, and has long been used as a text-book on the subject in many universities. Among his other works we may mention "Annales et Historiæ de Rebus Belgicis" (Amsterdam, 1657), written in a style that equals Tacitus for concise and pointed power; "Annotationes in Vetus Testamentum" (Paris, 1644); "Annotationes in Novum Testamentum" (Paris, 1644); "De Satisfactione Christi;" and "De Veritate Religionis

Digitized by Google

Christianæ" (Leyden, 1627), translated even into several Oriental languages, and remarkable for its clear arrangement, vigorous logic, and eloquent style. It is reckoned the best "apology" for Christianity in modern times.—Compare Butler, "Life of Grotius" (London, 1826); De Vries, "Huig de Groot en Maria van Reigersbergen" (Amst. 1827); Creuzer, "Luther und Hugo Grotius" (Heidelb. 1846).

GRO'TTA DEL CANE, or Grotto of the Dog, is a noted cave near Naples, in the vicinity of Lake Agnano and of Puzzuoli. It is about 10 feet deep, 4 feet wide, and 9 high, and is so full of carbonic acid gas, especially near the floor, that little animals introduced into it soon die, and tapers placed near the ground are extinguished. This cave was known to the ancients, and is described by Pliny. It derives its name from the practice of introducing small dogs, which are soon almost deprived of life by the gas, but recover upon being restored to the open air.

GROTTA'GLIE, a town in the south of Italy, in the province of Lecce, 12 miles north-east of Taranto. Pop. 8858. It dates its origin from the 10th c., when the inhabitants of several surrounding villages, that had been laid in ruins by the Longobards and Saracens, sought refuge here, and gave the name of G. to their new dwellings, from the *grotte* or caves which intersect the hill at the foot of which the town stands.

GRO'TTE, a town of Sicily, in the province, and 18 miles north-north-east. of Girgenti. It derives its name from the number of caves in the rocks around it, which prove it to have been an ancient site. It is supposed by some to be that of *Erbessus*, a town where the Romans deposited their military stores during their siege of Agrigentum, in 262 B.C., but which was seized by Hanno, the Carthaginian general. Sulphur is found largely in the neighborhood. Pop. 7800.

GROUND, in Painting, the coating or preparation put on the surface of the panel, board, or canvas on which a picture is to be painted. Artists attach great importance to the color and texture of the ground, as tending in no small degree to affect the technical quality of the work. In forming an opinion on paintings by old masters, the kind of ground used is always taken into consideration, for in different epochs and schools, particular grounds were used. The works of the Italian school preceding and during the time of Raphael were all painted on white grounds, and almost always on panels, even when the works were large, and many pieces had to be joined. The preparation was composed of *gesso*, plaster of Paris, or chalk mixed with size, and the ground was of course absorbent. Afterwards, when canvas came to be generally used, the works of the Italian and Spanish schools were generally painted on an oil ground of a dull red color; and when this was not covered by the artist with a thick *impasto* or body of paint, the picture was apt to become black and heavy, a fault very marked in the works of the school of the Carracci and the Neapolitan and later Roman schools. The works of the Dutch and Flemish masters, which are distinguished for brilliancy and transparency, were painted on light grounds, varying from white to gray, and their practice is generally followed in this country and in the modern schools abroad. The term *ground* is also applied to different parts of a picture, as the *foreground*, or portion of the picture on which are placed the figures or objects represented as nearest the spectator; *background*, the part, particularly in portraits, behind or on which it is intended to set off or relieve the head, figure, or group depicted. The portion of a model or carving from which the figures are projected, is styled the ground.

GROUND-ANNUAL, in the Law of Scotland, is an annual rent or annuity paid by the owner of land to a creditor or to the vendor of the land, and in most respects corresponds to Ground-rent (q v.) in England, though the parties stand in a converse relation. It also resembles a rent-charge (see RENT) in England, with a like distinction. Thus, when a vendor sells his land, and instead of taking a lump sum for the price, prefers a sum by way of a perpetual annuity or rent, he conveys the land in fee to the disponee or purchaser, subject to this ground-annual, which is a burden on the lands for ever after. The vendor or creditor is then called the ground-annualer, and if the ground-annual is not paid, he is entitled as a remedy to poind the ground, i. e., seize all the goods, whether of the owner or his tenants, which are found on

Digitized by Google

the lands, and pay himself, or he may sue the debtor. But he cannot, as a ground-landlord can do in England, pound the goods of the debtor's tenants to a greater extent than the current term's rent or arrears due by them.

GROUND DOVE AND GROUND PIGEON are names given to those birds of the family *Columbidæ* which in characters and habits approach most to the ordinary gallinaceous type. They have short and rounded wings, with much inferior power of flight to pigeons in general; their legs are longer, and their feet rather adapted for walking than for grasping. They are little arboreal in their habits, but live mostly on the ground. Many of them run very quickly. They have not in general much brilliancy of plumage, but among them are the beautiful bronze-wings (q. v.) of Australia.

GROUND-IVY (*Glechoma hederacea*, united with the genus *Nepeta* by some botanists as *N. Glechoma*), a plant of the natural order *Labiatæ*, a common native of Britain and other parts of Europe, growing in waste places, plantations, hedges, &c., in a dry soil. It has a creeping stem, kidney-shaped crenate leave, and axillary blue flowers growing in threes. The flowers have four ascending stamens, two long and two short, a 15-nerved 5-toothed and equal calyx, the anthers before bursting approaching in pairs and forming a cross. A tea prepared from the leaves is in great repute among the poor in many places, and the plant is stimulant, aromatic, and of use in pectoral complaints. The leaves were formerly used in England for clarifying and flavoring ale, which was then called Gill-ale or Goll-ale, from Gill or Gell, an old name of this plant; but this use has been discontinued since the introduction of hops.

GROUND-NUT, a term variously employed, to denote the seed of the *Arachis hypogæa* (see ARACHIS), and the tubers of certain umbelliferous plants, also called EARTH-NUTS (q. v.).

GROUND-RENT, in the Law of England, is the rent which a person, who intends to build upon a piece of ground, pays to the landlord for the use of the ground for a certain specified term, usually 99 years. The usual arrangement between the owner of the freehold of land and a speculating builder, is of this kind. The builder pays a certain annual sum by way of rent to the owner, who is thereafter called the ground-landlord, and then commences to build upon the land. The builder then lets the houses, and in doing so he of course includes in the rent which he puts upon each house a proportionate part of this ground-rent, which he himself is bound to pay to the ground-landlord, so that practically the tenant pays both the rent and the ground-rent, the latter being so called because it issues out of the ground, independently of what is built upon it. Ground-rents often form a safe investment for capital, because the security is good. This security consists in the ground-landlord being able, whenever his ground-rent is in arrear, to distrain all the goods and chattles he finds on the premises, to whomsoever they may belong; and as the ground-rent is generally a small sum, compared with the furniture of the tenant, he is always sure to recover its full amount. This power of distress exists whether the tenant has paid his rent to his own landlord or not; but if at any time the tenant has been obliged to pay the ground-landlord the ground-rent, which it is the duty of his own landlord in general to pay, he may deduct such sum from the next rent he pays, or, as it is called, may set off the one against the other so far as it will go. Strictly speaking, there are thus two landlords. The ground-landlord is the over-landlord, and has the paramount security; the other landlord is landlord to the tenant who actually occupies, but is himself tenant to the ground-landlord, for he merely holds a lease. He is what is called a mesne landlord. At the end of the 99 years, or whatever other term is fixed upon, the whole of the building becomes the property of the ground-landlord, for the interest of the builder or his assignees then expires by effluxion of time; and as the building is a fixture, and cannot be carried away. it thus falls in to the landlord, and often thereby creates a great accession of wealth.

Ground-rent corresponds to *feu* in Scotland, with this difference, that the feu-rent in the latter case lasts for ever, there being no definite term fixed for its ceasing.

GROUND SQUIRREL (*Tamias*), a genus of rodent quadrupeds of the Squirrel

Digitized by Google

family, differing from the true squirrels in the possession of cheek-pouches, in having a more slender body and shorter legs, and in other less important particulars; but most of all in their habits, residing chiefly on the ground; and seldom ascending trees to any considerable height. They are of small size, are all longitudinally striped on the back and sides, are extremely active and restless, and emit a peculiar "chipping clucking sound, very widely differing from the quacking, chattering cry of the squirrels." A well-known species is the HACKEE or CHIPPING SQUIRREL (*T. Lysteri*) of North America, of a brownish-gray color, striped with black and yellowish white, the belly white. It is much persecuted by boys, with whom the hunting of it is a favorite sport. The fur is used for muffs, tippets, &c. Other species of G. S. are found in America, Asia and Africa.

GROUNDLING (*Botia tænia*), a small fish of the family *Cyprinidæ*, found in some of the rivers of England. It is never more than three or four inches long. It receives its name from habitually keeping close to the bottom. It is probably often mistaken for the Loach (q. v.), which it much resembles; but, besides its smaller size, it is of a much more compressed form, and is particularly distinguished by a forked spine beneath each eye. These have been made generic distinctions. Several species having these characters are found in the Ganges.

GROU'NDSEL, the common name of those species of *Senecio* (q. v.) which have small heads of flowers either destitute of ray or with the ray rolled back. The COMMON G. (*S. vulgaris*), one of the most plentiful of weeds in waste and cultivated grounds in Britain and most parts of Europe, is usually destitute of ray. It is a coarse-looking annual, of rapid growth, about a foot high, branched, with pinnatifid leaves, and small yellow heads of flowers; flowering at all seasons, even in winter when the weather is mild; and its seeds, like those of other *Compositæ*, are widely diffused by means of their hairy pappus, being wafted about by the wind. It has a rather disagreeable smell; but birds are very fond of the young buds and leaves, and cage-birds are fed on them. It has a saltish taste, whence its name. Its leaves, beaten into a coarse pulp, and externally applied to the stomach, cause vomiting some hours after their application; it also makes a good poultice for boils and sprains.—The other British species are weeds of very similar appearance, but are stronger, have a more disagreeable odor, and are viscid to the touch.—Like other annual weeds, the groundsels are to be hoed down or pulled as they appear, when the ground is in crop.

GROUP, the combining of several bodies so as to form an agreeable whole. In drawing, one or more groups compose the picture. A bunch of grapes, a cone, or a pyramid have been taken by different artists as the model form of a group.

GROUSE (*Tetrao*), a genus of gallinaceous birds, which, as defined by Linnæus, included patridges, quails, and all the birds now forming the family *Tetraonidæ*, and divided into many genera. The *Tetraonidæ* have a very short bill, rather thick, sharp, and a little curved, and very generally a naked red patch over or behind the eye. They have three toes before, and generally one hind toe, placed high on the tarsus, but the hind toe is often very short, and sometimes wanting. Those to which the name of G. is popularly given have the legs feathered to the feet, but in the genus *Tetrao*, as now restricted by ornithologists, the toes are not feathered; in moorfowl and ptarmigan, they are completely so, and these have therefore been separated into a distinct genus, *Lagopus*. Partridges, quails, &c., which have not the tarsi feathered, are regarded as connecting the families *Tetraonidæ* and *Phasianidæ*, and are sometimes referred to the latter, although their intimate connection with the former is generally recognised. Some of the *Tetraonidæ* are polygamous, and this is the case with all, or almost all, the species of the genus *Tetrao*, whilst those of *Lagopus*, so nearly allied to them, pair.—The genus *Tetrao* contains the largest birds of the family, exceeded in this respect by almost no other gallinaceous birds. They have a full figure, with much muscular power, the tail is longer than in most of the family, is composed of broad feathers, and generally rounded. The females differ very considerably in plumage from the males, which are often resplendent in black, brown, green, and blue. The species are natives of the northern and temperate parts of Europe, Asia, and America, the regions in which the *Tetraonidæ* in general are most abundant, although some of the family are found in warmer and more southern countries. The largest species of *Tetrao*, is the Capercailzie (q. v.), Wood

Digitized by Google

G., or Cock of the Woods (*T. urogallus*); and next to it, among European species, ranks the Blackcock (q. v.), (*T. tetrix*), the only other European species indeed, if the somewhat rare *T. hybridus* of continental Europe, the *Racklehahn* of the Swedes (see BLACKCOCK), be regarded as the result of a mere accidental intermixture of these two.—The PINNATED G., or PRAIRIE HEN (*T. cupido*) of North America, is rather smaller than the blackcock; the general color of the plumage is yellowish-red, with bars and crossings of black; the tail is very short and much rounded. The male has neck-tufts of narrow feathers, the largest of which are five inches long, and is still more remarkably adorned with two loose pendulous wrinkled skins, extending along the sides of the neck for two-thirds of its length, capable of inflation with air, and when inflated, resembling in bulk, color, and surface, middle-sized oranges. This species of G. chiefly inhabits dry open districts, studded with trees or patches of brushwood. It was at one time common in New Jersey and Pennsylvania, as well as in the western prairies, but has always become rare as a district has become cultivated and populous, notwithstanding laws in some cases enacted for its preservation. It has almost disappeared from the state of Kentucky, where it was at one time so extremely abundant, that children were constantly employed to prevent its depredations in the cultivated fields, and multitudes were shot and trapped merely to be thrown away. In the north-eastern parts of the United States it exists, but is not abundant. It congregates in flocks in winter, which break up into smaller parties in spring. The males have many combats at the approach of the breeding season. Their voice is described as a low *looting* or *booming*. They strut, after the manner of turkey-cocks, with wings let down to the ground, and neck-feathers erected. Certain spots, known in the western parts of America as their *scratching-places*, seem to be specially appropriated for their displays and combats, and there considerable numbers often meet about daybreak, dispersing again after the sun is up. Many are shot on such occasions. The food of the Pinnated G. consists of seeds, berries, the buds of trees and bushes, insects, &c. It is highly prized for the table in those parts of America where it is rare. The flesh resembles that of the blackcock.—The SPOTTED G., or CANADIAN G. (*T. Canadensis*), is smaller than the Pinnated G., about equal to the Scottish moorfowl. It inhabits the northern parts of America, and is plentiful near Hudson's Bay. It is chiefly found in forests of pine or fir, feeding much in winter on the leaves and branchlets of these trees, as well as on their seeds, whence it is often called the Spruce Partridge. From this food the flesh acquires a strong and peculiar flavor in winter. The plumage of the upper parts is mostly brownish-black, transversely barred with brownish-grey; in some parts varying to a rusty orange. The tail is rounded.—The DUSKY G. (*T. obscurus*) is a species almost as large as the capercailzie, a native of the shady forests of the Rocky Mountains and the banks of the Columbia. The general color is blackish-brown, the wings lighter. The tail is large and rounded.—The MOORFOWL (q. v.), or RED G. of Britain, is allied to the ptarmigans rather than to these species, and is called Red Ptarmigan by some systematic writers, although it is the species to which, in popular language, the name G. is almost exclusively appropriated in Britain. Other species, often popularly called G., are noticed in the articles BONASIA, COCK OF THE PLAINS, GANGA, SYRRHAPTES, &c.

GROVES have, among almost all nations, been associated with religious rites, being chosen as suitable places for them, or even planted in order to this use. The pleasantness of groves may have had something to do with this, but probably far less than the sentiments of awe and solemnity naturally excited by the gloom of deep forests. Groves became so intimately associated with the idea of sacrifice and other religious rites, that the planting of a grove became itself an act of religion, like the erection of an altar or the building of a temple. Thus, "Abraham planted a grove in Beersheba, and called there on the name of the Lord, the everlasting God" (Gen. xxi. 33). Afterwards, however, the Jews were forbidden to plant groves near the altar of the Lord (Deut. xvi. 21, 22), because of their association with idolatry, and with the cruel and abominable rites of the nations of Canaan, and of the neighbors of the Jews.

GROWING CORN on a farm, or on land let to a tenant, may be distrained in England by the landlord for rent which is already due and in arrear; that is, the landlord may seize and sell the corn to pay his rent. In Scotland, growing corn

Digitized by Google

may also be sequestrated by the landlord (which means the same thing); but this can be done only for the rent which is current, and which will become due for the same year to which the crop belongs. In England, the landlord can distrain for several years' rent at one time.

GROWLER (*Grystes salmoides*), a fish of the Perch family, abundant in many of the rivers of North America, as in the neighborhood of New York. It attains a length of two feet. It is of an olive color, dark on the upper parts, and becoming grayish-white beneath. The G. is much esteemed for the table. It affords good sport to anglers. It receives its name from a sound which it emits. The genus Grystes has small scales and only fine cardlike teeth. Another species is found in the Macquarie River, in New Holland.

GRUB, the name commonly given to the larvæ of coleopterous insects. See COLEOPTERA. Some grubs are too well-known to farmers and gardeners for the injury they do to the roots of plants, and thus we hear of crops suffering from *the grub*, but different species are destructive to different kinds of plants. The most important are noticed under their proper names, and reference is made from the more important cultivated plants to those grubs most hurtful to them.

GRUBBER, an agricultural implement which has recently come into very general use, and of which there are many forms of varieties, all, however, essentially the same in their principle as well as in their uses. Some of the forms are called by their inventors *Cultivators* and *Scarifiers*. The grubber consists of a framework of cast or wrought iron, in which are fixed *tines* or teeth, somewhat like those of a harrow, but curved, and so placed as to enter the ground somewhat obliquely when the implement moves forward; the whole moving on wheels, by which the depth to which the teeth may penetrate is regulated; it is provided with various mechanical adaptations, enabling the workman somewhat to vary the depth, or to lift the teeth out of the ground partially or altogether, when it may be necessary to clear them of obstructive clods or accumulations of weeds, to turn at the head of a ridge, or to travel to or from the field. The grubber is sometimes used for tearing up clover-fields and stubbles before the plough is used, but more generally in land already ploughed, to stir it afresh, to clear it of weeds, to bring clods to the surface, that they may be broken, &c. A grubber with five teeth gives work for two strong horses.

GRU'GRU, the grub or larva of *Calandra palmarum* (also called *Rhyncophorus palmarum*, and *Cordylia palmarum*), an insect of the weevil family (*Rhyncophoræ*), inhabiting Guiana and other tropical parts of America. The perfect insect is an inch and a half long. The grub is an ugly inactive creature of a whitish cream color, as long and as thick as a man's thumb, and lives in the soft and spongy central part of the Cabbage Palm (*Euterpe oleracea*), on which it feeds. It is extremely fat and oily, and is esteemed a great delicacy, not only by the Indians, but by many of the European colonists and their descendants, particularly the Dutch. It is cooked by roasting, and eaten with bread and butter, after being sprinkled with cayenne pepper. The fragrance of roasted grugru is said to be most tempting to epicures. A cabbage palm which has been cut down often becomes in a short time almost filled with grugrus; but they are usually obtained from the upper part of the stem of growing palms near the crown. A negro is often sent up with a cutlass, to cut them out of the wood.

GRÜ'NBERG, a town of Prussia, in the province of Silesia, is prettily situated near the northern boundary of the province, on the Golden Lunse, 59 miles north-north-west of the town of Liegnitz. It consists of the town proper, surrounded by a wall, pierced by three gates, and of four important suburbs, and is seated amid vine-clad mountains. G. is chiefly known for the fine sparkling wine which is extensively produced in the vicinity. The 700th year of its trade in this excellent commodity was celebrated here in October 1850. G. has also an active trade in the manufacture of woollen cloths and tobacco, and in the growing of fruit. Pop. (1875) 12,248.

GRUS AND GRUIDÆ. See CRANE.

GRUYÈRES, a small decayed town of Switzerland, in the canton of Freiburg, and 16 miles south-south-west of the town of that name, is situated about a mile from the left bank of the Saane or Sarine. The town is known from its giving

Digitized by Google

name to the famous Gruyères cheese, which is made in great quantities in the surrounding district. Population (1870), 1097.

GRY'LLUS, a Linnæan genus of insects of the order *Orthoptera*, answering to the section *Saltatoria* (Lat. leapers) of later entomologists, and containing crickets, grasshoppers, locusts, &c. The genus has been subdivided into many genera, which have been grouped into families; but great confusion exists in the nomenclature, the crickets and their allies being the genus *Gryllus*, and family *Gryllidæ* of some authors, *Acheta* and *Achetidæ* of others; grasshoppers being *Gryllus* and *Gryllidæ* of some, *Locusta* and *Locustidæ* of others; and locusts, in like manner, being *Locusta* and *Locustidæ*, or *Acrydium* and *Acrydidæ*. See CRICKET, GRASSHOPPER, and LOCUST. The three groups are very closely allied. They are all characterised by the large thighs of the last pair of legs, and great power of leaping. The stridulous sounds which they emit are produced in some—crickets and grasshoppers—by rubbing together the bases of the elytræ; in others—locusts—by rubbing the thighs against the elytræ. The females generally lay their eggs in the ground.

GRYS-BOC (*Antilope melanotis* or *Calotragus melanotis*), an animal of the antelope family, a native of South Africa, and common in most parts of Cape Colony. It is about three feet in length, and about a foot and a half in height at the shoulder. The grys-boc lives in pairs on the plains. It is not very swift, is easily captured, and its flesh is much esteemed.

GUA'CHARO (*Steatornis Caripensis*), a remarkable South American bird, of the order *Insessores*, and tribe *Fissirostres*, generally referred to the family *Caprimulgidæ*, but widely differing from the goatsuckers and most of that family, and indeed from the *Insessores* generally, in having a strong bill, and being frugivorous. The food of the G. consists of hard and dry fruits. It is about the size of a common fowl; the plumage brownish gray, with small black streaks and dots. The G. is a nocturnal bird, a circumstance very singular among frugivorous birds. It spends the day in deep and dark caverns, where great numbers congregate and make their nests. Humboldt gives a most interesting account, in his Personal Narrative, of a visit to the great Guacharo cavern in the valley of Caripe, near Cumana. This cavern is visited once a year for the sake of the fat of the young birds, which are slaughtered in great numbers, and their fat melted and stored for use as butter or oil. The clarified fat is half liquid, transparent, inodorous, and will keep for a year without becoming rancid.

GUACHINA'NGO, a small town of Mexico, in the north of the state of Puebla, and 103 miles north-east of the city of Mexico, has a population of 6000, and is noted for the great quantity of excellent vanilla raised in the vicinity.

GUA'CHOS, the name given to the country-people who inhabit the Pampas in the states of La Plata, and are engaged in rearing cattle. Although they pride themselves on being whites, they belong chiefly to the Mestizo class, and by their intercourse with Indian women, contribute to approximate the population of the inland provinces to the type of the aboriginal inhabitants, whom they likewise greatly resemble both in their manners and turn of mind.

GUADALAJA'RA, or Guadalaxara, one of the handsomest towns in Mexico, is the capital of the state of Xalisco, in the Mexican Confederation. It stands on the Rio Grande de Santiago, which, after passing through Lake Chapala, enters the Pacific at San Blas. The population has been estimated at 90,000. As the houses are generally but two stories high, the place covers a wide extent of surface. It contains the buildings for the government, a cathedral, a mint, an episcopal palace, an opera, large barracks, a college, and many inferior seminaries. It has well-supplied markets, and extensive manufactures of cotton and earthenware.

GUADALAJARA (anc. *Arriaca*), a decayed town of Spain, capital of the province of the same name, is situated on the left bank of the Henares, 35 miles north-east of Madrid. It is a large but ill-built town, and contains many buildings of interest, which, however, are for the most part falling to ruin from neglect. The chief of these are the palace of the Mendozas, the feudal lords of G.; the *Panteon*, in

Digitized by Google

which they are buried; and the churches of San Francesco and San Esteban. G. is the chief town of the fine pastoral and wheat district of the Alcarria. Pop. 7650.

GUADALAJARA, a province of Spain, the most north-eastern of the five modern provinces into which New Castile has been divided. Pop (1870) 208,638. See CASTILE.

GUADALAVIA'R, or Turia, a river of Spain, has its source near that of the Tagus, in the south-west of Aragon, and after a course of 180 miles, in a generally south-south-east direction, falls into the Mediterranean, at Grao, a mile and a half east of Valencia. The G., in passing through the beautiful gardens of Valencia, is divided, for purposes of irrigation, into eight canals. Its mouth is much silted up.

GUADALQUIVI'R (Arab. *Wad-al-Kebir*, the great river; anc. *Bœtis*), the most important river of Spain, for the mass of waters which it conveys to the ocean, and for the extent of its natural navigation; has its origin in the Sierra de Cazorla, near the eastern border of the province of Jaen; flows in a general south-west direction through the provinces of Jean, Cordova, Sevilla; and forming the boundary for about ten miles between the provinces of Huelva and Cadiz, falls into the Atlantic at San Lucar de Barrameda, after a course of about 360 miles. The principal towns upon its banks are Montoro, Cordova, and Sevilla, to the last of which, about 80 miles above its mouth, the river is navigable. Below Sevilla it twice divides itself into two branches, forming two islands—the Isla Menor and the Isla Mayor. Its chief affluents are the Gadajos and the Jenil on the left, and the Guadalimar and the Guadiato on the right. The lower course of the G. is sluggish and dreary in the highest degree; the stream itself is turbid and muddy, and eats its way through an alluvial level given up to herds of cattle and to aquatic fowls. There are no villages in this district, which, though favorable to animal and vegetable life, is fatal to man, from the ague and fever caused by the numerous swamps. There is no great trade on the G.; foreign vessels are generally moored at the Isla Menor, and their cargoes sent up to Sevilla by means of barges.

GUADALU'PE, a river of North America, rises in the southern section of the state of Texas, and flows in a south-eastern direction, emptying its waters into Espiritu Santo Bay, after a course estimated at about 250 miles. The geography of this stream and its capabilities are not yet well known.

GUADALUPE-Y-CALVO, a town of Mexico in the state of Chihuahua, and 170 miles south-south-west of the town of that name, is situated in a mountainous district in close vicinity to several important silver mines. Pop. 10,000.

GUADELOU'PE, one of the Lesser Antilles in the West Indies, and the most important of those which belong to France, lies in lat. 16° n. and long. 61° 45' w., and contains 600 sq. m., with a pop. (including dependencies) in 1874 of 167,344, of whom ⅓ths are colored. It is divided into Grande Terre on the east, and Basse Terre or Guadeloupe Proper on the west, by a strait of about 40 yards in width, which, under the name of Salt River, is navigable for vessels of fifty tons. The nomenclature of the separate islands is apparently out of place, for of the two Basse Terre is the loftier and Grand Terre is the smaller. Graud Terre, generally low, is of coral formation; Basse Terre, on the contrary, is traversed by volcanic mountains, which culminate in La Soufrière (the "Sulphur Mine") to the height of 5108 feet. Though this range shews no regular crater, yet it emits by several orifices columns of smoke, and even sparks of fire. In addition to these symptoms of subterraneous action, may be mentioned a boiling spring and frequent earthquakes. Basse Terre, on the island of its own name, is the chief town, having an indifferent harbor. Connected with G. as dependencies, are the neighboring islets of Desirade, Marie Galante, Les Saintes, and the north part of St Martin. In 1870, the exports to France amounted to 24,900,000 francs, and the imports from France to 9,800,000 francs. In 1848, slavery was abolished by a decree of the French republic. The island was discovered by Columbus in 1493, but it was not before 1635 that it was colonised by the French; and after repeatedly falling into the hands of England during her wars with France, it was at length permanently ceded to the latter power in 1816.

GUADIA'NA (anc. *Anas*), one of the longest but at the same time the narrowest

Digitized by Google

and poorest in volume of the five great Spanish rivers, rises on the western boundary of Murcia, about 8 miles north-west of the town of Alcaraz. From its source it flows north-west for about 30 miles, after which it disappears among swamps; flows underground in a westward direction for nearly 80 miles; and rises again at Daymiel, after throwing up in its subterraneous course numerous lakes called *Los ojos* (the eyes) *de la Guadiana*. From Daymiel it pursues a westward course through La Mancha and the province of Estremadura, until, passing the town of Badajoz, it bends southward, and flows in that direction, forming, for about 35 miles, the boundary between Spain and Portugal. Near the town of Monsaras it enters the Portuguese territory, and flows through the eastern district of the province of Alemtejo. Finally, turning eastward, and again forming the international boundary for about 30 miles, it enters the Atlantic below the town of Ayamonte. It is about 520 miles in length, and is navigable only for about 35 miles. Its chief affluents are the Giguela on the right, and the Javalon and Ardilla on the left.

GUA'DUAS, a city of the United States of Columbia, is situated in that portion of the republic which belongs to South America. It stands near the east or right bank of the Magdalena, high among the Andes, and is one of the most elevated towns on the globe, being 8700 feet above the level of the sea. It contains about 4000 inhabitants.

GUAIA'CUM, a genus of trees of the natural order *Zygophyllaceæ*, natives of the tropical parts of America, having abruptly pinnate leaves, and axillary flowers on one-flowered stalks, often in small clusters. The flowers have a 5-partite calyx, five petals, ten stamens, and a tapering style; the fruit is a capsule, 5-angled, and 5-celled, or the cells by abortion fewer, one seed in each cell. The trees of this genus are remarkable for the hardness and heaviness of their wood, generally known as *Lignum Vitæ*, but sometimes as *Guaiacum Wood*; and sometimes as *Brazil Wood*; as well as for their peculiar resinous product, *Guaiacum*, often but incorrectly called *Gum Guaiacum*. The species to which the commercial Lignum Vitæ and Guaiacum are commonly referred, is *G. officinale*, a native of some of the West India islands, and some of the continental parts of America; a tree sometimes 30 or 40 feet high, with two or three pairs of ovate, obtuse, and perfectly smooth leaflets, pale blue flowers, a furrowed bark, and generally a crooked stem and knotty branches. It seems probable, however, that other species, as well as this, supply part of the G. wood and resin of commerce. At present, they are obtained chiefly from Cuba, Jamaica, and St Domingo. The wood is imported in billets about three feet long and one foot in diameter, of a greenish-brown color. This is the color of the heart-wood, the sap-wood is pale yellow. G. wood is remarkable for the direction of its fibres, each layer of which crosses the preceding diagonally; annual rings are scarcely to be observed, and the pith is extremely small. It sinks in water. It is much valued, and used for many purposes, chiefly by turners; ships' blocks, rulers, pestles, and bowls (see BOWLS) are among the articles most commonly made of it. When rubbed or heated, it emits a faint disagreeable aromatic smell; its taste is also pungent and aromatic. Shavings and raspings of the wood are bought by apothecaries for medicinal use. The bark is also used in medicine on the continent of Europe, although not in Britain. The virtues of both wood and bark depend chiefly on the resin which they contain, and which is itself used in powder, pill, and tincture. It is an acrid stimulant, and has been employed with advantage in chronic rheumatism, in chronic skin diseases, in certain cases of scanty and painful menstruation (and hence it is occasionally an effectual remedy in cases of sterility), and in chronic catarrh. It has also been highly praised as a preventive of gout. The resin is an ingredient of the well-known *Plummer's Pills*. In the 16th and 17th centuries, G. was the remedy most in repute for syphilis. The resin sometimes flows spontaneously, from the stem of the G.-tree; it is sometimes obtained artificially. It is of a greenish-brown color, and has a brilliant resinous fracture. It has scarcely any taste, but leaves a burning sensation in the mouth. One of its most striking characteristics is, that it is colored blue by its oxidising agents. It contains *guaiacic acid* ($HO,C_{18}H_7O_3$), which closely resembles benzoic acid, and yields, on distillation, certain definite compounds known as *guaiacine*, *pyroguaiacine*, and *hydride of guaiacyl*.

Digitized by Google

GUAN, or Yacou (*Penelope*), a genus of large gallinaceous birds of the family *Cracidæ*. They have a naked skin on the throat capable of being inflated or swollen, and a naked space around each eye. The name G. more particularly belongs to *Penelope cristata*, a species of which the entire length is about thirty inches. It is a native of the forests of Brazil and Guiana, and has been long domesticated in South America. It has been found to endure the climate of Britain and of Holland so well, that hopes are entertained of its becoming common in the poultry-yards of Europe. Its flesh is much esteemed.

GUANABACO'A. See HAVANNA.

GUANAHA'NI, or Cat Island, one of the Bahamas, is generally regarded as Columbus's first discovery in the New World, being presumed to be identical with the San Salvador of the illustrious navigator. Recent criticism, however, appears to have transferred this honor to Watling Island (q. v.), which is about 50 miles to the east-south-east.

GUANAJUA'TO, or Guanaxuato, an inland state of Mexico, in lat. between 20° and 22° n., and long. between 99° 40' and 102° 40' w., is bounded on the n. by the states of San Luis Potosi, on the e. by Queretaro, on the s. by Michoacan, and on the w. by Xalisco. It has an area of 11,400 square miles, and a population in 1873 of 730,000. The surface, a portion of the lofty plateau of Anahuac, has an elevation of 6000 feet above sea-level, and is traversed by chains of mountains, among which those of Santa Rosa are porphyritic, and present elevations of 11,400 feet in height. The state is watered by no river of consequence. The soil is fertile; maize, wheat, and frijoles (beans) are the chief grain crops raised; the vine, the *chili colorado*, or red pepper, and the olive, are also largely cultivated. Among the valuable mineral products of the state are silver, iron, lead, and copper, the first in the greatest abundance. The manufactures are woollens, cottons, leather, earthen-ware, and refined sugar. The climate is mild and pure. The population of the state divides itself into three races—25 per cent. of the whole being whites, 39 per cent. Indian, and 36 per cent. mixed.

GUANAJUATO, or Santa Fé de Guanajuato, a city of Mexico, capital of the state of the same name, is irregularly built on an extremely uneven district of hill and valley, in lat. 21° n., and long. 100° 50' w. The streets are steep and tortuous, but the houses are generally well built, and have gaily painted outsides, green being the favorite color. It contains many fine public buildings, the chief of which are the cathedral, the monasteries (eight in number), the college, the gymnasium, the theatre, and the mint. G. stands in a district in which within a circuit of five leagues, there are upwards of 100 mines. Pop. 63,000.

GUANAPA'RO, a river of Venezuela, in South America, rises in the department of Caraccas, and after an easterly course of 230 miles, joins the Portuguesa, which again, through the Apure, sends its tribute to the Orinoco.

GUANA'RÉ, a river of Venezuela, in South America, is an affluent of the Portuguesa. See GUANAPARO. On its banks are two towns, both of which derive their names from it; Guanarito, an inconsiderable place; and Guanare, a city of 12,000 inhabitants.

GUANCABELI'CA. See HUANCAVELICA.

GUA'NINE, is a yellowish-white, amorphous substance, which derives its name from its being a constituent of guano; it, however, also forms the chief constituent of the excrement of spiders, has been found attached to the scales of fishes—the bleak, for example—and seems to be a normal constituent of the mammalian liver and pancreas.

G. belongs to that class of bodies which were formerly called bases, but which, from their combining equally with acids, bases, or salts, are now often termed amides or amide-like compounds.

By oxidation with permanganate of potash, it is converted into urea, oxalic acid, and oxyguanine, a substance not yet sufficiently studied.

With regard to its occurrence in guano, as it has not been found in the recent excrement of sea-birds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of the uric acid, much as uric acid can be made to yield urea and oxalic acid. And in the pancreas and liver it probably represents

Digitized by Google

one of those transitory stages of distintegrated nitrogenous tissue which are finally excreted by the kidneys in the more highly oxidised form of urea.

GUA'NO (derived from the Peruvian word *huano*, dung) is the excrementitious deposit of certain sea-fowl, which occurred in immense quantities on certain coasts and islands where the climate is dry and free from rain. Although the use of guano as a manure is comparatively recent in this country and in Europe, its value in agriculture was well known to the Peruvians long before they were visited by the Spaniards. We learn from the "Memoriales Reales" of Garcilasco de la Vega, published in 1609, that in the times of the Incas no one was allowed, under pain of death, to visit the guano islands during the breeding season, or, under any circumstances, to kill the birds which yield this substance; and that overseers were appointed by the government to take charge of the guano districts, and to assign to each claimant his due share of the precious material. Alexander von Humboldt first brought specimens of guano to Europe in 1804, and sent them to Fourcroy, Vauquelin, and Klaproth, the best analytical chemists of the day.

Mr Nesbit, in a useful little pamphlet entitled "The History and Properties of the Different Varieties of Natural Guano," remarks that the quality and value of these manures, commercially, depend almost wholly upon the amount of decomposition to which they have been subjected by the action of the atmosphere. The fæcal matter of the fish-eating birds, which, by its long accumulation, forms the guano deposits, consists essentially of nitrogenous and phosphatic compounds, the former being chiefly ammonia salts derived from the decomposition of the uric acid and urates which exist in the fresh excrements of these birds. The ammoniacal portion of these deposits, and some of the phosphates, are tolerably soluble in water, and are readily washed away by rain. The late Professor Johnston remarked that "a single day of English rain would dissolve out and carry into the sea a considerable portion of one of the largest accumulations, and that a single year of English weather would cause many of them entirely to disappear." In dry climates, where very little rain falls, as in some parts of Bolivia and Peru, on the western coast of South America, the dung deposited suffers very little from the action of the atmosphere, and retains nearly the whole of its soluble nitrogenous and phosphatic compounds. Guanos, on the other hand, found in regions where rain falls freely, lose a great part of their soluble constituents, but remain rich in their less soluble constituents—the phosphates of lime and magnesia. Mr Nesbit divides guanos according to their composition, into three classes: 1. Those which have suffered little by atmospheric action, and which retain nearly the whole of their original constituents, such as the Angamos and Peruvian guanos. 2. Those which have lost a considerable portion of their soluble constituents, such as the Ichaboe, Bolivian, and Chilian guanos. 3. Those which have lost nearly all their ammonia, and contain but little more than the earthy phosphates of the animal deposit. Many of these are largely contaminated with sand. In this class we place the various African guanos (excepting that from Ichaboe), West Indian guano, Kooria Mooria (islands off the coast of Arabia) guano, Sombrero guano, Patagonian guano, Shark's Bay guano (from Australia), &c.

The following table represents the mean of 78 samples of Peruvian guanos, analysed by Mr Way:

Moisture	18·67
Organic matter and salts of ammonia	52·05
Earthy phosphates	22·78
Alkaline salts containing 3·34 phosphoric acid, and equal to 6·89 soluble phosphate of lime	9·67
Sand, &c.	1·83
	100·00
Ammonia, per cent.	16·52

Most of the so-called Peruvian guano has been obtained from the Chincha Islands, which are three in number, and are situated about 12 miles off the coast of Peru, between 13 and 14 degrees s. lat. Each of these islands is from 5 to 6 miles in circumference, and consists of granite covered with guano, in some places to a

Digitized by Google

height of 200 feet, in successive horizontal strata, varying in thickness from three inches to a foot, and in color from a light to a dark brown. Sometimes, however, is found a vertical surface of upwards of 100 feet of a perfectly uniform appearance. If Humboldt's statement is correct, that "during 300 years the coast-birds have deposited guano only a few lines in thickness," the extreme age of the lower strata becomes at once obvious.

The following, from Muspratt's "Chemistry," gives the mean of several analyses of the inferior kinds of guano, the first four belonging to Nesbit's second class, and the remaining three to his third class:

	Ichaboe	Ichaboe	Chilian	Bolivian	Patagonian	Kooria Mooria	Saldanha Bay
	Earlier cargoes	Recent cargoes					
Moisture	27·3	20·0	20·4	10·0	25·0	18·1	20·0
Organic matters and salts of ammonia	34·3	24·4	18·6	21·6	18·3	12·4	14·9
Earthy phosphates	30·3	20·4	31·0	51·5	44·0	42·7	56.4
Alkaline salts	5·0	6·2	7·3	14·1	2·1	4·2	5 8
Carbonate of lime						4·1	
Sand, &c.	3·1	29 0	22 7	2 7	10·6	18·5	2 9
	100·0	100 0	100·0	100·0	100·0	100·0	100·0
Ammonia per cent.	7·3	6·0	5·47	4 5	2 5	2·05	1·47

The nitrogen in these analyses is calculated as ammonia for the purpose of comparison. In reality, it exists in various forms of combination—viz., as uric acid, urea occasionally, urate, oxalate, hydrochlorate, phosphate, &c., of ammonia, other urates, guanine (q. v.), and undefined nitrogenous compounds. Hence, as may be inferred, a complete analysis of guano is a work of very considerable labor; but as its agricultural value depends mainly on the quantities of ammonia, soluble and insoluble phosphates, and alkaline salts, which it contains, such analyses as those we have given are sufficient for practical purposes, and they are easily made.

As good Peruvian guano sold long at from £11 to £13, and latterly at about £14 per ton, there was a strong inducement to adulterate it. Umber, powdered stones, various earths, partially decomposed sawdust, and other substances, were used for this purpose, and specimens have been sold containing mere traces of the genuine article. Hence it is expedient that large purchasers should either send a sample to a good chemist for analysis, or should cork up and retain a small quantity in a bottle for analysis, provided the crops to which he has applied his guano do not answer reasonable expectation. A chemist is attached to most agricultural societies and clubs, who performs such analyses for a moderate fee. The numerous analyses of Professor Anderson, late chemist to Highland Society, and of other chemists, have had a very material effect in checking the sale of adulterated guano in Scotland. Still, the adulteration of manures has for some time been rather more common in Scotland than in England. True, guano is not so often adulterated as some other fertilisers; but in England, the rigorous measures adopted by Dr Voelcker and the Royal Agricultural Society to expose dealers in spurious articles, and to suppress such traffic, have had a very beneficial effect. In Scotland, the agricultural public awakened to the magnitude of the question. Several district analytical associations have been formed throughout the country. With all this machinery in full play, the fraudulent dealer will fortunately find his avocation as stiff work in Scotland as he has latterly discovered it in England.

Digitized by Google

Such facilities for analysis will to a considerable extent supersede the following ancient yet simple modes of testing the quality of guano. A pretty good idea, however, can be formed of the superiority or otherwise of the samples of guano by these tests:

1. *Test by Drying.*—If the guano, as is generally the case with the Peruvian and Chilian varieties, is a uniform powder, weigh out two ounces, spread it on paper, and let it lie two days in a dry and moderately warm room. What it may then have lost in weight must be esteemed superfluous water. Many sorts of guano are so moist as to lose 20 or 25 per cent. of their weight by this gentle drying. If we wish to determine the water with greater accuracy, a smaller quantity of guano should be placed in a shallow platinum capsule, and moistened with a few drops of hydrochloric acid. A heat of 212° may then be applied without loss of ammonia.

2. *Test by Combustion.*—Pour half an ounce of the guano into an iron ladle, such as is used for casting bullets, and place it upon red-hot coals, until nothing but a white or grayish ash is left, which must be weighed after cooling. The best sorts of Peruvian guano do not yield more than 30 or 33 per cent. of ash, while inferior varieties, such as Patagonian, Chili, and African guano, leave a residue of 60, or even 80 per cent.; and those which are intentionally adulterated, may leave a still larger residue. Genuine guano of all kinds yields a white or gray ash; and a yellow or reddish ash indicates the adulteration with earthy matter, sand, &c.

This test is based upon the fact, that the most important ingredients, viz., the nitrogenous compounds, become volatilised, and escape, when subjected to a sufficient amount of heat. The difference of odor of the vapors evolved in the process, according as we are working with first or third rate guano, must also be noticed. The vapors from the better kinds have a pungent smell like spirits of hartshorn, with a peculiar piquancy somewhat resembling that of rich old decayed cheese; while those rising from inferior varieties smell like singed horn-shavings or hair.

3. The *Lime test* affords a ready means of roughly determining the relative quantities of ammonia in different specimens of guano. Put a teaspoonful of each kind of guano, and an equal quantity of slaked lime, into a wine-glass; then add two or three teaspoonsful of water, and mix the substances together with a glass rod. Lime being a stronger base than ammonia, liberates the latter from the ammonia salts contained in the guano; and the better the guano is, the stronger will be the pungent ammoniacal odor which escapes from the mixture. The slaked lime should be preserved in a dry and well-corked bottle, so as to exclude the air.

4. The *Hot-water test* affords a simple means of determining the goodness of guano. We may either boil half an ounce of dried guano in five or six ounces of water, and filter the solution while hot, or we may place the guano on a filter, and continue to pour boiling water over it, until the drops that come through the filter cease to yield any residue when heated to dryness on a glass slip held over the spirit-lamp. As a general rule, the larger the quantity of guano that is dissolved in hot water, the more ammonia salts does it contain, and the better it is. In the best or Peruvian guano, the insoluble residue ranges from 50 to 55 per cent., while in the inferior varieties it may amount to 80 or 90 per cent.

5. The *Acid Test* serves to detect the chalk which occurs in the Kooria Mooria guano, and is used as an adulteration for other varieties. Mix the powdered guano with a little water, and add a little hydrochloric acid or strong vinegar. If chalk is present, effervescence from the liberation of carbonic acid occurs.

6. The *Weight* affords the easiest test for the purity of guano. According to Professor Anderson, a bushel of pure Peruvian guano should not weigh more than from 56 to 60 lbs.; but according to most authorities it should weigh almost exactly 70 lbs. If heavier than 78 lbs., it is adulterated with clay, marl, sand, or some other impurity.

If the value of a manure be calculated, as is done by Boussingault and other chemists, according to the amount of nitrogen which it contains, one ton of good Peruvian guano is equal to 33⅓ tons of farmyard manure, 20 tons of horse-dung, 33⅓ tons of cow-dung, 22½ tons of pig-dung, or 14½ tons of human excrement.

When we consider what guano is—viz., that being the more or less decomposed excrement of fish-eating birds, it consists essentially of the ash constituents of the flesh of fish, together with ammonia salts—we need not wonder that its application to the land as a manure should so largely increase its productiveness, "for guano,"

Digitized by Google

says Liebig, "contains not only the mineral elements which a soil must possess to produce corn, but also in the ammonia an indispensable element of food which serves to quicken their action, and to shorten the time required for their assimilation. On many fields, the ammonia in the guano may, if the weather prove propitious, possibly effect the assimilation of double the ordinary quantity of these mineral constituents, and thus render the amount of produce yielded in one year equal to what would have been otherwise obtained in two years by these mineral matters alone."

The introduction of guano into this country as a manure is comparatively recent. In 1840, only 20 casks of it were imported. In 1841, the Earl of Derby—then Lord Stanley—spoke strongly in its recommendation at the Liverpool meeting of the Royal Agricultural Society of England; and from that time it has come rapidly into use, as may be seen by the following table of imports:

Years.	Tons.	Years.	Tons.
1841	2,881	1852	129,889
1842	20,898	1854	285,111
1843	30,002	1855	305,061
1844	104,251	1857	288,362
1845	283,300	1858	358,541
1846	89,203	1859	84,122
1847	82,892	1860	141,435
1848	71,414	1865	257,892
1849	83,438	1867	192,306
1850	116,925	1870	280,311
1851	243,014	1872	116,704

As the chemical composition of natural guano is known, an artificial guano may be readily compounded by the admixture, in due proportions, of its constituents. The following mixture, recommended by the late Professor Johnston, forms one of the best imitations of guano, 132½ lbs. of it being equal in power to 1 cwt. of good Peruvian guano: Mix 78¾ lbs. of bone-dust, 25 lbs. of sulphate of ammonia, 1¼ lb. of pearl-ash, 25 lbs. of common salt, and 2½ lbs of dry sulphate of soda. All these materials, excepting the bone-ash, may be procured from any druggist.

Guano was largely used for all the cultivated crops on the farm, and is yet, as far as it can be procured. Being a high-priced, but concentrated and powerful fertiliser, in ordinary farm-management it is applied with more economical results to some crops than to others. On grasses proper, it is sown broadcast in the early part of spring, when vegetation begins to start. At this time the roots take it up, and prevent it from being washed out of the soil. Clover, on the other hand, being a deep-rooted plant, is supposed by some to be best dressed with it in autumn, before vegetation is stopped for the season. The roots store up the active principles of the manure till spring, and the plants are in a far more vigorous state for the summer growth. From two to three cwts. of guano per acre is the common allowance for grasses intended to be cut for hay, but the Italian variety of ryegrass will sometimes bear a large quantity with beneficial results. Guano is rather too soluble to be applied to early autumn sown wheat. It both stimulates the plant too much before winter, and is apt to be partially washed out of the soil with the winter rains. In moist springs, when there are abundance of rains to wash it in, guano forms an admirable top-dressing for winter wheat. For spring sown wheat, and other cereals, no manure has a more powerful influence. The closer that it is put to seed, the better. The common dressing is from three to four cwts. to the acre for cereals. It should be kept in mind, in regulating the quantity, that the stronger the land is, the larger the quantity that can be applied with a prospect of yielding a profit. The same principle should be observed in its use for the turnip crop. As much as from four to six cwts. may sometimes be beneficially applied to early sown turnips on deep and able soils, while two to three cwts., when farmyard manure is given, will in general prove the most economical quantity. Guano is apt to produce too much heat when it is applied in large quantities to late sown turnips, and to prevent the formation of bulbs. In such circumstances, phosphoric manures will often yield better crops at less expense. When guano is applied to beans or potatoes, they should be also dressed with farmyard manure. Guano does not

Digitized by Google

possess the power of sustaining the healthy growth of these plants on most soils without something else in addition.

Mixed with rough bones, guano is valuable, applied above dung for turnips, and a great deal of it has been so used. Its value as a fertiliser was so highly appreciated, and its use so extensive, that farmers got not a little alarmed and disappointed at the diminution of the genuine Peruvian guano supplies. Agriculturists of necessity betook themselves of late to various artificial substitutes for Peruvian guano, but the results are not generally so satisfactory. Farmers learned, in the spring of 1874, with satisfaction, of the discovery of new guano deposits on the coast of Peru. For the Peruvian government, Mr M. H. Thierry explored the new deposits, and he estimated the total quantity at 7,500,000 tons. Of seven different places mentioned as containing that deposit, Pubellon de Pica, having 5,000,000 tons, is the principal. Analyses already made of the new guano on behalf of the government proved it equal in quality to the guano of the Chincha Islands.

GUANONIEN. Under this name, Du Chaillu, in his second volume of travels, entitled "A visit to Ashango Land," mentions a great bird of prey, inhabiting the tropical parts of Western Africa, hitherto unknown to naturalists, which he thinks may probably rival in size the condor of South America. He failed, however, in all endeavors to procure a specimen, the bird being apparently very wary. He regards it as an eagle, and not as a vulture, and its habits shew this conjecture to be probable. The traveller says: "Several times I have been startled in the forest by the sudden cry of anguish of a monkey who had been seized by this 'leopard of the air,' as the natives often call it, and then saw the bird, with its prey, disappear out of sight." On one occasion, he saw a nest of this bird at the top of a gigantic tree, but the young had flown away. At the foot of the tree lay more than 100 skulls of monkeys, of different sizes, some of which must have been formidable animals.

GUAPEY', a river of South America, rises in Bolivia, and joins the Mamore on its way to the Amazon, after a winding course of 550 miles.

GUAPO'RÈ, a river of South America, rises in Brazil, and, after a course of 400 miles, unites with the Mamore to form the Madera, an affluent of the Amazon.

GUARA'NA BREAD is a kind of food prepared by the savages of Brazil from the seeds of a plant supposed to belong to the genus *Paullinia* (natural order *Sapindaceæ*), and which has been called *P. sorbilis*. It is in round or oblong cakes, which are regarded in all parts of Brazil as very efficacious in the cure of many disorders, and which contain, besides other substances, some of them nutritious, a considerable quantity of a substance supposed to be identical with theine or caffeine. The Brazilians pound the Guarana Bread in water, sweeten it, and use it as a stomachic and febrifuge. It is also reputed aphrodisiac.—The genus *Paullinia* contains several species remarkable for their extremely poisonous properties.

GUA'RANTY, or Guarantee, is a contract by which one person binds himself to pay a debt or do some act in case of the failure of some other person, whose debt or duty it is to do the thing guaranteed. The person so binding himself is generally called the surety in England, while the person who is primarily liable is called the principal. Thus, where A borrows money, and B joins as a party in a bill of exchange or a bond to secure the loan, B is a surety. Where B guarantees that certain goods which are supplied to A shall be paid for, he is more usually styled a guarantor than a surety, but the liability is the same.

Such a contract must be in writing, for the Statute of Frauds (29 Charles II. c. 3) required that no action should be brought whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person, unless the agreement or some memorandum or note thereof should be in writing and signed by the party to be charged therewith, or some other person by him lawfully authorised. So that a surety can only be bound by some writing signed by himself or his agent. And Lord Tenterden's Act (9 Geo. IV. c 14, s. 6) enacted the same thing as to persons making representations as to the character, ability, or dealings of another, with intent that the latter may obtain credit. In order to bind the surety, there must also be no deceit or misrepresentation used as to the nature of the risk or as to the state of the accounts. If a guaranty is given to a firm, it is

Digitized by Google

not binding after a change in the firm, unless the parties expressly stipulate to the contrary. If the creditor discharge the principal, or even give time, by way of indulgence to him, the surety is released, for he is thereby put to a disadvantage. In general, the creditor can sue either the principal or the surety for the debt at his option. If the surety is obliged to pay the debt of his principal, he can sue the principal for the money so paid, and is entitled to have all the securities assigned to him, so as to enable him to do so more effectually.

In Scotland, the law is substantially the same as regards principal and surety, or, as they are there called, principal and cautioner; but there are some minor differences, though many of the differences which formerly existed between the laws of the two countries, were swept away by the statutes 19 and 20 Vict. c. 97, and 19 and 20 Vict. c. 60. The chief differences now are, that in Scotland it is not necessary to prove any consideration for the contract, though the contract is not by deed; that liability of the surety continues seven years, whereas in England it continues generally only six years—and that the discharge of the surety can be proved only by the writ or oath of the creditor, whereas in England it can be proved by oral evidence. See Paterson's "Comp. of E. and S. Law."

GUARDAFUI', Cape (anc. *Aromatum Promontorium*), the most eastern point of the African continent, and the extremity of an immense promontory stretching seaward in an east-north-east direction, and washed on the north-west by the Gulf of Aden, and on the south-east by the Indian Ocean. The cape is in lat. 11° 50′ n., long. 51° 20′ e.

GUA'RDIA-GRE'LÉ, a small and unimportant town of S. Italy, in the province of Chieti, 12 m. south-south-east of the town of Chieti. Pop. 7970.

GUARDIAN, in English Law, is the legal representative and custodier of infants i. e., persons under the age of 21, and various species are distinguished. Guardian by nature is rather a popular than a legal term, especially when used in reference to a father or mother, who are often called guardians by nature. In its technical sense, it is confined to an ancestor who is said to be guardian of his heir-apparent. *Guardian for nurture* is the name given to a father, or, after his death, to the mother, who, as such, has the custody and control of children until the age of 14. *Guardian in socage* is the term anciently given to the next of blood who had the legal custody of the person as well as estate of the heir to lands which descend in socage or freehold, until the heir attains the age of 14. A father may, by deed or will, appoint a guardian to his child. If he do not, the lord chancellor will do so; but practically, this is only done when the child is entitled to property. When a guardian is appointed by the Court of Chancery, the infant is called a ward of court, and requires the sanction of the guardian for most purposes, and requires the permission of the Court of Chancery to marry, or rather, if the infant marries without such permission, those who were privy to such a contempt of court may be punished. A *guardian ad litem* is a person (usually the father, if alive) appointed by the Court of Chancery for the purpose of carrying on a suit in the name of an infant. In general, the power of a guardian extends to the person as well as the property of the infant; but in the case of guardians appointed by the Court of Chancery, their powers are under the strict control of that court.

The guardian of a Lunatic (q. v.) is usually called a committee. In Scotland the word "guardian" is sometimes used in reference to lunatics, but seldom applied, except in a popular sense, to those who have the custody and care of children. In corresponding cases in Scotland, the custody of a child under 12, if female, or 14, if male, belongs to her or his Tutor (q. v.); and from those ages to 21, the child has no legal guardian, being *sui juris*, but the care of the child's property belongs to a Curator (q. v.)

Guardian of the poor, is in English parochial law an important functionary, being a person elected by a parish or union of parishes to manage the affairs of the poor. The ancient officers of the parish who attended to the affairs of the poor were called overseers; but by statutes, most of which are recent, it has been thought better to have a larger body of persons elected by the ratepayers of the parish to discharge most of these duties. Hence, many of the larger parishes are, either by a special statute or by order of the Poor-law Board, put under a board of guardians, and all poor-law unions are managed by guardians also. The ratepayers, in voting, have

Digitized by Google

one vote for each £50 of rent they pay, but in no case are allowed more than six votes. The guardians have the management of the workhouse, and the maintenance, clothing, and relief of the poor, and in the regulations must comply with the orders of the Local Government Board, whose president is a member of the government, acting by these orders and by statutes. The office of guardian is compulsory, but may be refused, if notice is given during the election. See also Poor.

Guardaful
Guarini

In Scotland, the corresponding duties are discharged by the Parochial Board (q. v.), which is subject to the general Board of Supervision.

GUARDS are in all armies the élite of the troops, and usually those most heavily armed. In the British service, the Guards constitute in time of peace the garrison of London and the guard of the sovereign at Windsor. The Guards compose what is called the Household Brigade, and include in cavalry the Grenadier Guards, the Cold-stream Guards, and the Scots Fusilier Guards. These distinguished corps comprise and the Royal Horse Guards (Blue); and in infantry the 1st and 2d Life Guards, 1302 cavalry in three regiments, and 5940 infantry in seven battalions. Before the abolition of purchase, the regiments of Foot Guards held higher army rank than that they bore regimentally; that is, ensigns ranked with lieutenants of other regiments, lieutenants with captains, captains with lieutenant-colonels; and on exchanging into the line they were thus enabled to exchange into the higher positions, a circumstance which often placed officers of comparatively short service over veterans of the line, and caused perhaps more heart-burning than any other anomaly among our regulations. When purchase was the rule, every officer in the Guards was quite ready to accede to it; when it was abolished in 1871, this excep-tional rank was also abolished in regard to all officers newly entering the Guards.

GUARDSHIP, the ship-of-war in charge of a port. She generally acts also as a dépôt for seamen raised there until appropriated to other vessels, and her captain is responsible for the safety and proper preservation of the men-of-war which may be laid up—out of commission in the harbor. The superintendent of a dockyard, if a flag-officer, carries his flag at the mast-head of the guardship; if he be only a cap-tain, the guardship is usually under the commander or next senior officer, although the duties are carried on by the nominal command, actual

GUAREA, a genus of tropical American trees of the natural order *Meliaceæ*, of some of which the bark is used as an emetic and purgative. *G. grandifolia* is called Musk-wood in some of the islands of the West Indies; the bark smelling so strongly of musk, that it may be used as a perfume.

GUARINI, Giovanni Battista, a popular and elegant poet, was born at Ferrara in 1537. At the termination of his studies in the universities of Pisa, Padua, and Ferrara, he was appointed to the chair of literature in the latter, and soon after, the publication of some sonnets obtained for him great popularity as a poet. At the age of 30, he accepted service at the court of Ferrara, and was intrusted by Duke Alfonso II. with various diplomatic missions of delicacy and importance. Differences between him and the duke induced him to withdraw from the court of Ferrara, and having resided successively in Savoy, Mantua, Florence, and Urbino, he returned to his native Ferrara, and discharged one final public mis-sion, that of congratulating Pope Paul V. on his election to the tiara. He died in 1612 at Venice, whither he had been summoned to attend a lawsuit. An irascible sensitiveness, joined to an exaggerated estimate of his personal dignity, neutralised many qualities both brilliant and solid, which seemed to fit G. exactly for a court career. To these defects, in part, may be attributed the frequent mortifications which tracked him through life. As a poet, he is remarkable for refined grace of language and sweetness of sentiment, while his defects are occasional artificiality, a too constant recurrence of antithetical imagery, and an affected dallying with his ideas. His chief and most popular work, "Il Pastor Fido" (The Faithful Swain), is regarded in Italy as a standard of elegant pastoral composition, and obtained a high measure of popularity on its appearance. The writer designed it as a tragi-comic pastoral; its first dramatic representation was translated into Latin, and was in honor of the nuptials of the Duke of Savoy and Catherine of Austria, 1585. It subsequently ran through forty editions during G.'s life, and was frequently compared; the two poets were literary friends Tasso and G. have been almost all the modern languages and reciprocal admirers, although rivals in love. G.'s varied writings, including son

Digitized by Google

nets, comedies, satires, and political treatises, were published at Ferrara in 1737, 4 vols. 4to.—See "Storia della Letteratura Italiana del Tiraboschi."

GUARI'NO (Lat. *Varinus*), a learned Italian, born at Verona in 1370, went to Constantinople in 1388 to learn Greek under Chrysoloras. After his return, he taught in Verona, Padua, and Bologna, was tutor to Prince Lionello of Ferrara, acted as interpreter at the council of Ferrara, and died in 1460. He performed great services for the revival of classical studies; translated the first ten books of Strabo, and a portion of Plutarch; commented on Cicero, Persius, Juvenal, Martial, and Aristotle; and wrote a "Compendium Grammaticæ Græcæ," which was printed at Ferrara in 1509.—Compare Rosmini, "Vita e Disciplina di Guarino" (3 vols. Brescia, 1805—1806).

GUATEMA'LA, the name of two cities in Central America.—1. Guatemala (Old) stands at the foot of Volcan d'Agua, in lat. 14° 30′ n., and long. 90° 45′ w. Once the capital of the country, it was twice destroyed, first in 1541, by an eruption, and again in 1773, by an earthquake. Though, after the second disaster, it was supplanted by its more modern namesake, yet it was, to a certain extent, rebuilt. It numbers about 20,000 inhabitants; and many of its ancient buildings, more especially a cathedral and a palace, remain entire.—2. Guatemala (New), capital of the republic of the same name, is situated in a rich and spacious table-land, at an elevation of 4961 feet above the sea, in lat. 14° 37′ n., and long. 90° 30′ w. It is 24 miles to the east-north-east of the original capital. Population estimated at 45,000. The people manufacture muslins, cotton-yarn, plate, artificial flowers, and beautiful embroidery, carrying on at the same time a prosperous trade in the agricultural productions of the neighborhood. The place is well supplied with water by an aqueduct.

GUATEMALA, nominally a republic, but really an oligarchic state of Central America, terminates this division of the new continent towards the north-west, being washed at once by the Caribbean Sea and the Pacific Ocean. It stretches in n. lat. from about 14° to 17°, and in w. long. from 88° to 93°, containing 40,620 square miles, and 1,190,750 inhabitants. The surface presents great variety, mountains and valleys, plains and table-lands. The different levels, ranging from the seashore to an elevation of 5000 feet, have each its own climate and temperature. The country is subject to earthquakes, and abounds in active volcanoes. Being nearly as populous as all the other states of Central America put together, G. popularly gave name, in the early days of independence, to the confederation which they temporarily formed; and, from the same pre-eminence, it had given name, under the Spanish domination, to a still more extensive region. The government is in the hands of a president elected for four years, with a Council of State and a House of Representatives. Formerly the president was elected for life, and under Rafael Carrera (1854—1865) the government was carried on in the interest of a dissolute aristocracy and a debased priesthood. The banished Jesuits were recalled, the convents re-established, &c. Now a different order of things prevails. A new code of laws has been drawn up; the monastic order has been wholly suppressed; and, though the Roman Catholic is the established religion, others are tolerated. In 1874, the imports and the exports respectively amounted to £610,801 and £657,744, the trade with Great Britain, partly direct and partly through Belize, comprising two-thirds of the former, and nearly three-fourths of the latter. The chief articles imported were cottons, silks, woollens, hardware, ironmongery, linens, and jewelry; and the chief articles exported were cochineal, indigo, sugar, hides, country manufactures, sarsaparilla, and mahogany. Formerly, cochineal was the principal export, in worth more than doubling all the others put together; but of late years, owing to a disease among the cochineal insect, coffee has been the staple.

GUA'VA (*Psidium*), a genus of trees and shrubs of the natural order *Myrtaceæ*, mostly natives of tropical America, and some of them yielding fine and much valued fruits. They have opposite entire, or almost entire leaves, a 3—5-lobed calyx, 4—5 petals, and a 1—5-celled berry, with many-seeded cells. The COMMON G. or WHITE G. (*P. pyriferum*) is a low tree of 7—20 feet, with numerous branches, obtuse smooth leaves 2½—3 inches long, and fragrant white flowers on solitary axillary stalks. It is said to be a native both of the East and West Indies, and is now much cultivated in both. It is not improbable, however, that it was introduced into the East

Digitized by Google

Indies from America, but it has now become fully naturalised. Sir James E. Tennent says it is to be seen in the jungle around every cottage in Ceylon. It has long been occasionally grown as a stove-plant in Britain. The fruit is larger than a hen's egg, roundish or oblong, smooth, yellow; the rind thin and brittle; the pulp firm, full of bony seeds, flesh-colored, aromatic, and sweet. The jelly or preserve made from it is highly esteemed, and is now regularly imported into Britain from the West Indies and South America. The rind is stewed with milk, and is also made into marmalade. This fruit is rather astringent than laxative. G. buds, boiled with barley and liquorice, make a useful astringent drink in diarrhœa.—The RED G. (*P. pomiferum*), also now common in the East as well as in the West Indies, produces a beautiful fruit, with red flesh, but not nearly so agreeable as the white guava. It is very acid.—The CHINA G. (*P. Cattleyanum*), a native of China, produces fruit readily in vineries in Britain. It is a larger tree than the white guava. The fruit is round, about the size of a walnut, of a fine claret color, growing in the axils of the leaves; the pulp purplish-red next the skin, becoming paler towards the centre, and there white, soft, subacid, and of a very agreeable flavor. It makes an excellent preserve. It succeeds in the open air in the south of France.—On some of the mountains of Brazil grows a dwarf species of G., called Marangaba (*P. pygmæum*) a shrub 1—2 feet high, with fruit about the size of a gooseberry, much sought after on account of its delicious flavor, resembling that of the strawberry.—The BASTARD G. of the West Indies is a species of *Eugenia* (q. v.).

GUAXA'CO. See OAJACO.

GUAYAQUI'L, a term of various application in Ecuador, South America, indicates at once a river, a bay, a department, and a city.—1. The river is the only stream on the western coast of South America which can, without qualification, be said to be navigable for sea-going vessels. It is navigable for about 110 miles to Caracol, and is known in its upper course successively as the Caracol and Babahoyo.—2. The bay which receives the river, stretches in s. lat. between 1° and 4°, and in w. long. between 80° and 81°. It receives also the Daule and the Tumbez.—3. The department extends from the Pacific on the west to the departments of Quito and Assuay on the east, comprising a much wider belt of low and level land than is generally found further to the south, between the Andes and the sea.—4. The city, the capital of the department, stands on the right bank of the river, at the distance of 40 miles from its mouth. It is divided into two parts, the old and the new. The houses are mostly of wood; the principal are the cathedral, the two hospitals, and the two colleges, the last of which have faculties of theology, philosophy, and law. G. possesses the best, perhaps the only really good harbor on the Pacific shores of South America, the naturally deep channel being aided by a tide which sometimes rises and falls 24 feet. Occupying such a position, and being in lat. 2° 11′ s., the place is necessarily unhealthy. Still it has a population of 25,000, and carries on an extensive trade. In 1873 (besides the steam-packets), 128 vessels, of 113,084 tons, entered, and 118, of 110,662 tons, cleared the port. In 1870 the imports amounted to £760,500, the exports to £783,000. In 1869, the imports were £405,200; the exports, £594,500. In 1876 the exports were £673,925. The chief articles of import are cottons (more than a quarter of the whole), woollens, wines, spirits, grocery, soap, &c., metals, flour, and linens; and of export, cocoa, straw-hats, timber, bark, hides, orchilla, tobacco, sarsaparilla, canes, india-rubber, and coffee.

GUAY'RA, La, the principal sea-port of Venezuela, in South America, stands on a narrow strip of land between the mountains and the sea, and is about 5 miles from Caraccas, of which it is the port. The town, which is strongly defended, has a population of about 7000. The harbor is an open roadstead of the Caribbean Sea, and the anchorage is unsafe; but the trade of the port, which is entered annually by about 200 vessels, is extensive. The imports in 1874 were valued at about £736,000. The chief exports of G. are coffee, cotton, cocoa, and hides. The principal imports are woollens, calicoes, guns, cutlery, and china-ware from Great Britain; wines from France and Germany; flour, wheat, petroleum, machinery, and cotton goods from the U. S. of America.

GU'BBIO (ancient *Iguvium* or *Eugubium*), an interesting city in Central Italy, is beautifully situated on the south-western declivity of the Apennines, in the pro-

Digitized by Google

vince of Urbino, and about 27 miles south of the city of that name. Pop. 5350. It contains several fine edifices of importance. On the most elevated point of the city, where the ancient fortress stood, is the ducal palace, so call from having been erected and inhabited by the Dukes of Urbino, who also governed Gubbio. The municipal palace is a noble old pile of building, erected in 1332 by Matteo di Giannello, a native architect. In the palaces Brancaleone and Beni are valuable pictures, collections of Etruscan and other antiquities. G. possesses several fine churches, and some excellent public establishments for sanitary and educational purposes. The most important ancient remains are the ruins of a theatre, supposed to have been destroyed by the Longobards, a temple of Mars, and an Etruscan sepulchre of great antiquity. At a short distance from G. are the ruins of the famous temple of Jupiter Apenninus; and here, in 1444, were discovered the famous Eugubine Tables (q. v.).

GU'BEN, a manufacturing town and river-port of Prussia, in the province of Brandenberg, is charmingly situated on the Neisse—the banks of which are here planted with vines—at its confluence with the Lubst. 23 miles south-south-east of Frankfurt. Except its gymnasium, it has no notable buildings. The principal manufactures are woollen goods and tobacco. The shipping-trade of the Neisse is of some importance; ship-building is also carried on. On the neighboring heights, fruit-trees and vines are cultivated. The red wine produced here is esteemed one of the finest grown in the eastern portion of the kingdom. Pop. (1871) 21,423.

GUDGEON (*Gobio*), a genus of fishes of the family *Cyprinidæ*, having a short dorsal fin, a short anal fin, and no strong serrated ray in either, the body covered with rather large scales, and barbules at the angles of the mouth. The COMMON G. (*G. fluviatilis*) is abundant in many of the rivers of England, particularly in such as have gravelly bottoms, and occasional pools and rapids. It seldom exceeds eight inches in length; the depth is not one-fifth of the length. The tail is forked. The eye is placed high up on the side of the head. The upper parts are olive brown, spotted with black; the under parts white. Gudgeons swim in shoals. They feed on worms, molluscs, and other small animals, and are extremely ready to bite at a bait, which is commonly a small piece of a red worm. Great numbers are often taken even by young anglers, and the readiness with which the G. is lured has become proverbial. The G. is much esteemed for the table. Many are taken with casting-nets in shallow water, and kept in well-boats till wanted. Fishmongers also keep them in tanks, constantly supplied with fresh cold water. They thrive well in ponds supplied with fresh water by brooks.

The G. is usually one of the first objects of the juvenile angler's ambition; and with a crooked pin and thread, with a fragment of a worm for bait, the angler often imbibes his first love of the art while catching his first gudgeon. The G. is very easily captured. Swimming in large shoals at the bottom, it watches with incessant industry for every trifling matter brought down by the stream. A small red worm is by far the best bait for the G.; next to it, perhaps, a maggot or gentle. A small hook and a light float are required. A fragment of worm is fixed on the hook, neatness in baiting not being a desideratum, for the same bait, without much alteration, will often take ten or a dozen gudgeons in succession. The bait should drag or trip along the bottom; and if there be gudgeons about, it will hardly fail to attract them. Ground-bait is not required for G.; but if the angler will, with a large rake or any other heavy matter, disturb the gravel, and rake a clear bright spot, a yard in width, and two or three in length, the gudgeons, attracted by the dislodged particles, will swarm up to the spot in great numbers in search of food: and thus it is no uncommon thing to take, by one or two rakings, from five or six to ten or twelve dozen of gudgeons in one spot. There is no art required in the angling, as they bite very boldly, and the angler can hardly miss catching them.

GUDIN, Jean-Antoine-Théodore, French landscape and marine painter, was born at Paris, 15th August 1802, and studied for some time under Girodet-Trioson, but soon abandoned the style of this artist, and ranked himself with the Romanticists, on the side of Géricault and Delacroix. He first attracted notice by his picture, "Brick en Détresse," exhibited in 1822. Most of his marine pictures appeared at the Paris Exhibition of 1855. Between 1838 and 1848, G. painted more than eighty of such pieces for the Museum of Versailles. Since 1855 he has exhibited many new paintings.

GUE'BRES, Ghebres, Gabres, Ghavres (Turk. *Ghiaur* or *Ghaur*), the followers of the ancient Persian religion as reformed and consolidated by Zerdusht (Zoroaster). This name, Guebres, which is commonly, but against all lingu stic laws, derived from the Arabic *Kafir* (a word applied to all non-Mohammedans, and supposed to have been first bestowed upon this sect by their Arabic conquerors in 7th c.), is evidently nothing but an ancient proper name taken from some pre-eminent tribe or locality, since the Talmud (Jebam. 63 b., Gitt. 17 a. &c.) already knows them only by this name (Cheber); and Origen ("Contra Cels." vi. 291) speaks of Kabiri or Persians, asserting that Christianity has adopted nothing from them. They are also called *Atesh Perest*, or fire-worshippers; *Parsees*, or people of Pars or Fars—i. e., Persia; *Madjoos*, from their priests the Magi; and by themselves *Beh-Din*, "Those of the excellent belief;" or *Mazdaasnan*, worshippers of Ormuzd. For the origin, nature, and early history of this religion, see ZOROASTER, ZEND-AVESTA, SUN-WORSHIP. When the Persian empire became subject to the Mohammedan rule, the great mass of the inhabitants were converted to the religion of Islam. A very small number still clinging to the ancient religion, fled into the wilderness of Khorassan, or the island of Hormuz; but even this remnant was for many centuries the victim of constant oppression. Mahmoud the Ghiznevide, Shah Abbas, and others, are conspicuous by their untiring persecution of them; and the manner in which they were held up to general detestation is best shewn by the position assigned them in most popular Mohammedan tales as sorcerers and criminals. At this present moment, there are, according to the very latest native information, about 8000 Guebres scattered over the vast dominions of their ancestors, chiefly in Yezd and twenty-four surrounding villages. There are a few at Teheran, a few at Ispahun, at Shiraz, and some at Baku, near the great naphtha mountain, but all plunged in the depths of ignorance, and, with very few exceptions, of poverty. They have a high reputation for honor, probity, obedience to the law, chastity, and endurance. Another portion, after various migrations—which are told at length in the "Kissah-i-Sanjan," written by Behram (1599 A. D.)—reached India, where they are now settled under the name of Parsees, chiefly in Bombay, where they are very numerous, forming a population of above 50,000, or about 8 per cent. of the whole population. See PARSEES.

GUEBWILLER (Ger. *Gebweiler*), a town in the province of Alsace-Lorraine, 15 miles s. s. w. of Colmar, on the right bank of the Lauch, at the foot of the Ballon de Guebwiller. The town is well built, has two handsome churches, one built in the 11th, and the other in the middle of last century. There are manufactures of tapes, ribbons, cottons, woollen cloths, gloves, nails, and refined sugar; there is also an extensive manufacture of spinning machinery. In the vicinity are coal-mines and slate-quarries; good white wine is abundantly produced in the district. Pop. (1871) 11,838.

GUELDER ROSE, or Gueldres Rose, a cultivated variety of the Water-Elder (*Viburnum Opulus*—see VIBURNUM), in which the flowers are all barren, and instead of forming flat cymes, as in the wild plant, form much larger globose corymbs. It is sometimes called the SNOW-BALL TREE. When abounding in flowers, it is a very ornamental shrub, and is therefore very often planted.

GUE'LDERLAND. See GELDERLAND.

GUE'LPHIC ORDER, an order of knighthood for Hanover, instituted by George IV., when Prince Regent, on the 12th August 1815. It is both a military and civil order, unlimited in number, and consisted originally of three classes—Knights Grand Cross, Commanders, and Knights—to which the revised statutes of 1841 have added another class of simple members. The Grand Mastership is vested in the crown of Hanover. The badge of the order is a gold cross, surmounted by the Hanoverian crown—between each division of the cross is a lion passant gardiant. In the centre is the horse courant of Hanover, surrounded by a blue circle, and the motto, *Nec aspera terrent*.

GUELPHS AND GHIBELLINES, the names of two great parties, the conflict of which may almost be said to make up the history of Italy and Germany from the 11th till the 14th century. The origin of these names was formerly the subject of much speculation; but antiquarians are now agreed in tracing them respectively to the two families, Waiblinger and Welf, which, in the 12th c., were at the head of

Digitized by Google

two rival parties in the German empire, and whose feuds came to be identified historically with the respective principles for which these parties contended. The actual origin of the assumption of the names is commonly fixed at the great battle of Weinsberg, in Suabia, 1140 A.D., in which the two rival claimants for the empire, Conrad of Hohenstaufen, Duke of Franconia, and Henry the Lion, of the House of Welf, Duke of Saxony, rallied their followers by the respective war-cries, "Hie Waiblingen!" "Hie Welf!" but it is certain that the names were in use from an earlier date, although, probably, rather as representing the family feud, than the political principles which the two families afterwards severally supported. As the chief theatre of the conflict of these parties was Italy, the original names took the Italian form of *Ghibellini* and *Guelfi*. The former may, in general, be described as the supporters of the imperial authority in Italy, the latter, as the opponents of the emperors; and as the opposition to imperial authority in Italy arose from two distinct parties, which, for the most part, made common cause with each other —from the church, which asserted its own spiritual independence, and from the minor principalities and free cities, which maintained their provincial or municipal rights and liberties—the history of the struggle is involved in much confusion, and is variously related, and its merits variously appreciated, according to the point of view from which it is regarded. To the churchman, it is the struggle of the church against the state; to the friend of popular principles, it is the conflict of liberty against absolutism and centralisation. The same individual—as, for example, the poet Dante—is found to change sides in the struggle. For the most part, however, the interests of the church in these mediæval contests, although regarded by Protestants as excessive in degree, must be confessed to have fallen in with the claims of political and personal freedom. Five great crises in the strife of the Guelph and Ghibelline parties are commonly noted by historians: under Henry IV., in 1055; under Henry the Proud, in 1127; under Henry the Lion, in 1140; under Frederick Barbarossa, in 1159; and in the pontificate of the great champion of churchmanship, Innocent III. The cities of Northern Italy were divided between the two parties—Florence, Bologna, Milan, and other cities, as a general rule, taking the side of the Guelphs; while Pisa, Verona, and Arezzo, were Ghibelline. The great Italian families, in like manner, took opposite sides; but the policy of each family frequently varied from one generation to another. In general, it may be said that the nobles of the more northern provinces of Italy inclined to the Ghibelline side, while those of the central and southern provinces were Guelph. By degrees, however, especially after the downfall of the preponderance of the German emperors in Italy, the contest ceased to be a strife of principles, and degenerated into a mere struggle of rival factions, availing themselves of the prestige of ancient names and traditional or hereditary prejudices. Even in 1272, Gregory X. could with truth reproach the Italians with their sanguinary animosities for the sake of what were but names, the meaning of which few of them could understand or explain; and in the following century, in 1334, Benedict XII. practically disallows altogether the reality of the grounds of division between the parties, by prescribing, under pain of the censures of the church, the further use of those once-stirring names, which had long been the rallying words of a sanguinary warfare. From the 14th c. we read little more of Guelphs or Ghibellines, as actually existing parties; but in the sense already explained, the conflict of principles which they represent is found in every period of political history.

GUERA'RA, or Gerrara, a town of Algeria, in the district of the Beni-M'zab, stands on the left bank of a river called the Zighrir or Zegerin, in lat. 32° 45′ n., long. 5° e., and about 40 miles north-east of Ghardaia. It is a walled town, has three gates, and is a favorite commercial rendezvous for all the neighboring tribes, who frequent this place for the purchase or disposal of horses, asses, sheep, ivory, gold-dust, ostrich feathers, cotton, silk, cutlery, &c. The market of G. is supplied chiefly from Tunis and Algiers. The pop. is about 12,000.

GUERCINO, "the squint-eyed," properly GIAN-FRANCESCO BARBIERI, a celebrated master of the Bolognese school of painting, was born in 1590 at Cento, a pretty town not far from Bologna. G. gave early proof of his intuitive love of art, by sketching with the roughest materials on the house-door a Virgin so full of artistic promise, that his father, in spite of the straitened circumstances of the family, took immediate measures for training the boy's talents, by securing for him

Digitized by Google

the best tuition in drawing which the place afforded. In 1616 he opened an academy at Cento, to which pupils flocked from all quarters. From 1619 to 1623 he visited different cities of Italy, particularly Rome and Venice, to improve himself by the study of the works of other eminent painters. In 1642 he went to live at Bologna, where he died in 1666. Some of the early paintings of G. bear perceptible traces of his admiration of Caravaggio's style, both in their powerful effects of deep coloring and strong fidelity to nature, while they much surpass those of the great realist in dignity and refinement of tone. They are deficient, however, in accuracy of design. His works, which are too numerous for notice, are to be found in the galleries of Rome, Bologna, Parma, Modena, Perugia, and Paris. His master-pieces are considered to be the fresco of "Aurora," which decorates the ceiling of one of the casinos of the Roman villa Ludovisi; the famous "Persian Sibyl," and "Saint Petronilla," both in the Capitoline Gallery at Rome. At Cento, the artist's house, *Casa di Guercino*, is carefully preserved, with its fine paintings and fresco decorations, and is the chief object of interest to those who visit the place. The church of Cento also contains several fine works of this master, who had an intense love for his birthplace.

GUERICKE, Otto von, a celebrated physicist, was born at Magdeburg, in Prussian Saxony, 20th November 1602. His personal history contains nothing of interest. As a natural philosopher, he is chiefly known by his discoveries regarding the nature and effects of air. The experiments of Galileo and Pascal on the weight of air led G. to attempt the creation of a vacuum. His first experiment was made by filling a stout barrel with water, and then pumping out the water; but it was found that no sooner was a vacuum produced in the barrel than the air forced its way through. He now took a globe of copper, with an opening at the bottom into which a pump was fitted, provided with a stop-cock, and to his astonishment found that the pump extracted the air quite as well as the water; then, on opening the cock, the air was heard rushing in with a whistling noise. This, the first air-pump, was invented about 1650. G.'s invention soon became famous, and in 1654 he was summoned to the presence of the Emperor Ferdinand III. of Germany at Ratisbon, at which time he made the famous experiment commonly known as the Magdeburg Hemispheres (q. v.). He died at Hamburg, 11th May 1686.

GUÉRIN, Pierre Narcisse, Baron, one of the most eminent historical painters of the French classic school, was born at Paris, 13th May 1774, and first attracted notice by his "Corps de Brutus rapporté à Rome" (1796). Some of his pieces are regarded as masterpieces of the French classic school. The few portraits executed by G. are admirable. Among others may be mentioned one of Henri de la Roche-Jacquelin storming an intrenchment. In 1829 he was raised to the rank of baron, and died at Rome, 16th July 1833. Purity of design, dignity of style, taste in grouping, and harmony of color will be generally conceded to G., but the coldness which marks the classic school of painters is as visible in him as in others.

GUERITE, a small loopholed turret in the wall of a fortress, from which a sentry may command a view and fire over the ditch.

GUE'RNSEY, the second in size of the Channel Islands (q. v.), is situated in lat. between 49° 24′ and 49° 30′ N., and in long. between 2° 33′ and 2° 41′ W.; is distant 69 miles south-east from Start Point, in the south of Devonshire—the nearest point of the English coast; and is about 46 miles south-west from Cherbourg, in France. Its length is 9 miles, its greatest breadth about 6, and its circumference 31 miles. In 1871 it had a population of 30,593. The coast is of difficult approach, owing to the number of rocks and the rapidity of currents around the island. The northern part of the island is flat, the southern more elevated, but intersected by deep valleys and glens, and with a lofty and abrupt coast. St Peter's, on the southeast coast of the island, is the only town. For particulars about the climate, soil, productions, trade, &c., see JERSEY.

GUERRAZZI, F. D., a patriotic Italian statesman and brilliant writer, was born at Leghorn in 1805, and, educated for the legal profession, won a great reputation among his countrymen by his political fictions, which are said to have exercised an immense influence on contemporary Italian events by their exalted strain of patriotic enthusiasm and abhorrence of despotism. G.'s own words are, "he wrote a book when impotent to fight a battle." On the eve of the definite breach between

Digitized by Google

the people and the Grand Duke of Tuscany, in 1849, G. was induced to accept office in the ministry. On the flight of the Grand Duke, he was proclaimed member of the provisional government, and subsequently dictator. During this crisis of the state he energetically refused his adhesion to "the substitution of republicanism for monarchy," and preserved the strict autonomy of Tuscany until the return of the Grand Ducal rule, when he was immediately seized and imprisoned on the grounds of having neglected due measures of repression when the revolution first gathered strength during his ministry. His defence, entitled "Apologia della vita Politica di F. D. Guerrazzi," or "Justification of the Political Career of F. D. Guerrazzi," is a masterpiece. After an imprisonment of three years, he was condemned for life to the galleys, but was subsequently permitted to select Corsica as the refuge of his perpetual banishment. Restored to liberty and action by later events, G. sat in the parliament of Turin in 1862 and 1865. He died in Sept. 1873.

His chief works of fiction are "L'Assedio di Firenze" (the Siege of Florence), a magnificent historical novel, treating of the downfall of the republic of Florence; "La Battaglia di Benevento," remarkable for exquisite expression and beautiful poetic imagery; "Beatrice Cenci;" "Isabella Orsini;" "L'Asino;" and various other writings, which have run through innumerable editions and translations.

GUERRI'LLAS (diminutive of Sp. *guérra*, "war," literally "petty" or "partisan wars," or "partisan warriors"), the name given in Spain to the armed bands, composed of peasants and shepherds, who, on occasion of foreign invasion or civil wars, carry on an irregular warfare on their own account. From 1808 to 1814 they were regularly organised against the French, and being favored by the character of the country, were successful on many occasions, especially at the commencement of the war, under Empecinado, the Pastor Merino, Mina, and other leaders. The country itself suffered from the guerillas, who revenged political treachery, or even the bare suspicion of it, by fearful devastations. Many of them, particularly Mina's band, joined Wellington, and after having undergone a course of discipline, rendered signal service as regular troops. In all the recent civil wars of Spain, the guerillas, especially those of the Basque provinces, acted a prominent part on the Carlist side.

GUESCLIN, Bertrand du, Count of Longueville, Constable of France, the most eminent French general of the 14th c., was born of an ancient family in the district of Rennes, sometime between 1314 and 1320. As a boy, he was remarkably dull, and could never be taught either to read or write, but exhibited a passion for military exercises. In his 17th year he bore away the prize at a tournament at Rennes, and from this time was always successful in such encounters. In the contests between Charles de Blois and Jean de Montfort for the dukedom of Brittany, he took part with the former. After King John had been taken prisoner by the Black Prince at the battle of Poitiers, in 1356, G. rendered important services to the Dauphin, afterwards Charles V. He took Melun and several other fortified towns, freed the Seine from the English, and on Charles's ascension to the throne, in 1364, was created governor of Pontorson. In May of the same year he gained the battle of Cocherel, and was rewarded by the title of Count of Longueville and Marshal of Normandy. On the 29th September he was defeated and taken prisoner by the English, under Sir John Chandos, at the battle of Auray, but liberated on payment of a ransom of 100,000 livres, paid by the king, the pope, and several other princes. He now supported Henry, Count of Trastamare, against Pedro the Cruel, king of Castile, but was defeated and taken prisoner by the Black Prince. Being again ransomed on payment of a large sum, to which even the enemy contributed from feelings of respect, G. renewed the contest, and in 1369 defeated and slew Pedro, and placed the crown of Castile on the head of Henry of Trastamare. As an acknowledgement of his services, Henry created G. Count of Burgos, Duke of Molina, and Constable of Castile. He was, however, soon recalled by Charles V. of France, at that time hard pressed by the English, and raised by that monarch to the dignity of Constable of France. In the year 1370, G. opened his campaigns against the English, and in a short time the whole of their possessions were in the hands of the French, with the exception of a few fortified towns. While assisting his friend Sancerre in the siege of Châteaunneuf de Randon, in Languedoc, G. was taken ill, and died July 3, 1380. Charles V. caused him to be interred with great pomp beside his own burial-

vault at St Denys.—Compare Guyard de Berville, "Histoire de Bertrand du Guesclin" (Paris, 1767).

GUEUX, or "The Beggars," the name assumed by the confederated nobles and other malcontents who opposed the tyrannical policy of Philip II. of Spain in the Low Countries. Philip having sent nine inquisitors to that country to put into execution the decrees of the Council of Trent, provoked by this act the bitter resentment of the Protestants, as well as of the Catholics and nobility, who saw in it an attempt to curtail their ancient liberties. A party of opposition was thus formed, and, headed by Counts Louis of Nassau and Henry de Brederode, declared in an act called the "Compromise," which was remitted (5th April 1560) to the Regent Margaret, their fixed determination to ignore utterly the authority of the inquisitors. On the admission of a deputation from them to an audience, the regent seemed somewhat unnerved by their bold front, and inclined to yield to their demands; when one of her council approached her, and whispered that she "need not be afraid of these gatherings of beggars." The remark having been overheard by some of the deputation, the abusive epithet was assumed as the title of their association. As a sign of fraternity, each of the "beggars" wore a medal called the "beggar's denier," made of gold or silver, and stamped on the obverse with the image of Philip II., and the inscription, "In everything faithful to the king;" and on the reverse with a wallet, such as the mendicant monks carried, held in two hands, with the words, "even to the carrying of the wallet." The "beggars" maintained a long and vigorous contest against the despotic proceedings of Philip and his advisers, but were ultimately compelled to succumb to superior force. A branch of them, "the Beggars of the Sea," under the bold leadership of the savage Count de la Marck, were almost uniformly successful in their enterprises: they several times defeated the Spanish fleet, captured transports with supplies for Alva's army, captured several fortresses, and succored besieged places along the coast.

GUGLIELMI, Pietro, a celebrated musician and composer, was born at Massa di Carrara in 1727. From his father, who was *Maestro di Cappella* in the ducal chapel of Modena, he acquired the elements of music. His first opera, composed at the age of 28, was performed at Turin, and was greeted with enthusiasm. Previous to setting out on a continental tour he visited the chief cities of Italy, and was everywhere successful. After a residence of some months at Dresden, Vienna, and various other towns, G. passed over to London, where he remained five years, assiduously engaged in composition. At the age of 50 he returned to Naples with the double prestige of great fame and wealth. In 1798, Pope Pius VI. appointed him *Maestro di Cappella* at St Peter's, and from that time his official duties seem completely to have engrossed him. He died at Rome in 1804. The characteristics of his style are pre-eminently simplicity, purity, and precision, and these qualities he inexorably demanded from the exponents of his inspiration—"Sing *my* music and not *yours!*" His best known operas are—"La Clemenza di Tito;" "Artaserse;" "La Didone;" "Enea e Lavinia;" "La Morte di Oloferne;" "Debora e Sisera;" and the comic operas "La Virtuosa di Mergellina;" "I due Gemelle;" "La Serva Innamorata;" "La Pastorella Nobile;" "La Bella Pescatrice."

GUIA'NA, British (Fr. *Guyane*, Sp. *Guayana*, Port. *Guianna*), a section of the extensive tract forming the north-eastern portion of South America, lying between 8° 40′ n. and 3° 30′ s., and between the meridians of 50° and 68° w. The greatest length of this tract, from Cape North to the confluence of the river Xie with the river Negro, is calculated at 1090 miles; its greatest breadth, between Punta Barima, at the embouchure of the river Orinoco, and the confluence of the river Negro with the river Amazon, at 710 miles. It is at present politically divided into Venezuelan, British, Dutch, French, and Brazilian Guiana. The name G. is usually supposed to have been applied by the Dutch to the whole country from the name of a small river Wai-ini, a tributary of the Orinoco, on which stands a small town, called Guayana Vicija.

The limits of the British possessions have never yet been accurately determined. If we adopt the idea of Sir Robert Schomburgk, the latest authority upon the subject, and assume the natural indications to be the proper guide to the geographical boundaries, we shall include all the regions drained by the waters falling into the river Essequibo; and taking the river Corentyn as the acknowledged line of de-

Digitized by Google

marcation between British and Dutch G., we arrive at an area of 76,000 square miles, a territory much larger than England and Wales. If, on the other hand, the claims of the Venezuelan and Brazilian governments respectively are to be admitted, the British portion will be reduced to something above 12,000 miles, and become the smallest of the European colonies in this region.

The coast-line of the British territory consists of an alluvial flat, composed of a blue clay impregnated with marine salts, and mixed with decayed vegetable matter, which, in its decomposed state, forms a rich and highly productive soil. The inland depth of this fertile coast varies from ten to forty miles, where it is bounded by a range of sand-hills, varying in height from 30 to 120 feet. In the fifth parallel n. lat. occurs a chain of mountains composed of granite, gneiss, and trappean rocks, with their various modifications, and it has been conjectured that it was the ancient boundary of the Atlantic ocean. A peculiar feature of the interior is the savannas extending between the rivers Demerara and Corentyn, and at the river Berbice closely approaching the sea-shore. There is another series of such savannas further inland, and the geological structure of the region indicates that it was once the bed of an inland lake, which, by some great elemental disturbance, burst its barriers, and forced for its waters a passage to the Atlantic. This supposition may throw light upon the origin of the tradition of the White Sea and the city of the gold-besprinkled Manoa, which inflamed the ardor of the chivalric Raleigh, and led him to the pursuit of those discoveries by which his name has been immortalised.

The fluvial system of British G. consists mainly of four great and seven smaller streams, the whole of the first named and six of the latter pouring their waters directly into the Atlantic. The four great rivers are the Essequibo (q. v.), the Demerara (q. v.), the Berbice (q. v.), and the Corentyn (q. v.). The smaller streams are the Pomeroon, the Moruca, and the Wai-ini, between the Orinoco and the Essequibo; the Mahaica, the Mahaicony, and the Albany, between the Demerara and the Berbice; and the Canje, which joins the latter immediately before it falls into the ocean. In addition to the foregoing, there are numerous creeks of considerable size, formed by the surplus waters of the savannas behind the sea-coast.

All these streams are continually bringing down quantities of detritus; the coast outline is consequently undergoing perpetual changes: in one place, the drainage of the estates is blocked up by banks of drift mud; in another, incessant exertion is required to repel the encroachments of the sea.

Climate.—The climate of G. is genial and equable, and for a tropical country comparatively healthy. The thermometer ranges from 90° to 75° F., the mean temperature being 81°·226. The barometric pressure—highest, 30·05 in.; lowest, 29·74; mean, 29·916; average rainfall at Georgetown, 100·50 in.

History.—Whether Christopher Columbus himself ever actually landed on the shores of G. seems not to be positively ascertained. It is, however, certain that the Spaniards must have settled in the neighboring countries early in the 16th c., as in 1580, when the Dutch began to establish themselves on the banks of the Pomeroon and other rivers, they were speedily driven out by the Spaniards, nor was it until 1602 that they succeeded in obtaining a footing on the river Essequibo. During the 17th and the early part of the 18th centuries, the Dutch were frequently harassed by incursions of the French and by internal insurrections: three distinct colonies were constituted, until, in 1789, those of Essequibo and Demerara were united. Berbice remained a separate colony until 1831, when the three were constituted into the colony of British G., consisting of the counties of Demerara, Essequibo, and Berbice.

Towards the close of the 18th c., the feelings of the inhabitants had become strongly influenced by a desire to place themselves under British sovereignty, and in 1796 effect was given to that desire by the cession of the colonies to an expedition under Major-general Whyte. At the peace of Amiens, in 1802, however, the colonies were restored to the then "Batavian republic," to be again surrendered to Great Britain in 1803, which was finally confirmed at the peace of 1814.

Government.—The political constitution of the colony has undergone but little modification since its affairs were administered by the Dutch. It retains peculiarities which distinguish it from that of any other colonial dependency; the principal variations introduced have been the division of the colony into electoral districts; a new definition of the qualification for holding the electoral franchise, and open in-

Digitized by Google

stead of secret voting. The electors return members of two distinct bodies; one is termed the "college of electors," seven in number, who hold office for life, unless they quit the colony; the special function of this body will be explained hereafter. The other elected body is termed the "college of financial representatives," and consists of six members. The legislative body comprises ten members, five of whom, including the governor, who personally presides over its deliberations, are nominated by the crown, and hold office under it, the remaining five are chosen as vacancies occur, by the existing members of the court from a double nomination sent up by the college of electors above described. Once in each year, what is called the "combined court" holds a session for the purpose of agreeing upon the annual expenditure, and determining the nature and amount of the taxes to be levied. This court, which is also presided over by the governor in person, consists of the court of policy "combined" with the college of financial representatives, and its legislative functions are confined to passing the annual tax ordinance. Practically, in the legislative body, or court of policy, the governor is able to carry any measure he desires, possessing, as he constitutionally does, a double vote; but it is hardly necessary to add that this power has been very sparingly resorted to, and the same may be said of the power of vetoing any proposition brought forward either in that or the combined court, should he deem it objectionable. The direct responsibility of the governor to the crown for any and all of his acts, has been found in practice an ample safeguard against any abuse of these large prerogative powers. Another privilege reserved to the governor is that of originating all money votes; and while the majority in the combined court may reduce, they are prohibited from increasing the amount of any item of the public expenditure as annually settled.

The judicial system of the colony continued until a comparatively recent period to be as it was established by the Dutch; and the Roman code is still the basis of the administration of justice in civil matters. Trial by jury in such cases, at the option of either party, was introduced in 1844; and in criminal cases, trial by jury was established by law in 1846, and the English criminal code was adopted as the law of the colony.

Besides the supreme and inferior courts, presided over by judges, there are police and stipendiary magistrates in each town and district, with the ordinary powers of summary jurisdiction; a jail in each county, and a penal settlement for the more heinous classes of criminals, situated on the banks of the river Massarnni, about 70 miles from Georgetown. The stipendiary police consists of about 300 men, and there is a strong body of rural constables throughout the colony, consisting usually of the most trustworthy men on the estates, and in the villages, without distinction of races.

There are but two towns, properly so called, in the colony—Georgetown (q. v.) and New Amsterdam (q. v.).

The cultivated portion of the colony is confined to the sea-coast, and to a short distance up each of the rivers Berbice and Demerara. The estates were laid out by the Dutch in the shape of a parallelogram as nearly as circumstances would permit, and the staples were sugar, rum, and molasses, cotton and coffee. In 1747, two schooners sufficed to carry to Europe the crop of 559 half-hogsheads of sugar; in 1753, the culture of cotton and coffee commenced. Immediately after the conquest by the British in 1796, a great impetus was given to agricultural operations; since that period the fluctuations, arising from various causes at different times, have been considerable, of which some idea may be perhaps arrived at by glancing at the gradual decrease of the numbers of estates in cultivation. In 1831, there were altogether 322; thirty years later there were not more than 160. Cotton and coffee have ceased to be exported; the former is not cultivated, the latter to a very trifling extent. All available resources have been concentrated upon the production of sugar and rum; molasses have much diminished in quantity, owing to the improvement in the manufacture of sugar. By the introduction of improved machinery, and an accession of labor by means of immigration, the produce of many estates has been increased from 50 to 100 per cent. The timber trade has become of importance, and for this the colony is mainly indebted to the interest excited in its natural resources by the Great Exhibitions at London in 1851, and Paris in 1855, at which much Guiana produce was exhibited.

Digitized by Google

It has been ascertained that the population of the colony in the year 1874 amounted to 218,909, inclusive of the aborigines and the troops in garrison. As the increase since 1851 is more than accounted for by the net results of immigration during that period, it seems to follow that the Creole population has rather receded than advanced—a circumstance which, especially as it is believed to be borne out by the experience of some of the smaller West India insular colonies where immigration has had little or no influence, is matter of serious concern. It is, however, to be remembered, that in the interval the colony has been visited by epidemic cholera and small-pox, both extensively fatal, especially to the aged and the young.

The population is of a diversified character; the aboriginal Indians, who, rapidly becoming extinct, are supposed to number from 7000 to 10,000, within the British territory; the Creole negro; the mixed race; the immigrants from Madeira, from the East Indies, and from China; with a sprinkling of Europeans, chiefly British, French and Dutch. The immigrants of all races introduced from 1871 to 1874 inclusive, were 27,810. On the 31st Dec. 1874, there were 34,360 Indian coolies under indenture; and 14,653 working as ordinary laborers on the estates; 14,988, not indentured, being otherwise employed.

For ecclesiastical purposes, the colony is divided into 17 parishes, of which seven belong exclusively to the Church of Scotland, and eight exclusively to the Church of England, while Georgetown, in Demerara, and New Amsterdam, Berbice, have ministers of each church appointed to them. The ministers of both churches, with those of the Roman Catholic Church and the Wesleyan Church, are maintained by salaries from the Colonial Treasury, secured by law for a term of years. There are also independent missionaries scattered throughout the colony, who are supported exclusively by the voluntary contributions of their flocks. In 1874, the charge for religion amounted to £19,563, 19s. 6½d. In the same year public education cost £19,525, 18s. 1d., and was reported by the inspector to be in an unsatisfactory state.

The position of this important dependency may be described as one of advancing prosperity, but until a more ample supply of available labor induces a greater influx of capital, it cannot be asserted that its condition is positively satisfactory. Like the other sugar-producing colonies of Great Britain, it has had to struggle against great difficulties—partly, at least, arising from imperial legislation; and it has still to contend with an expensive system of recruiting the deficient labor market from distant regions.

The statistics of the years 1851 and 1874 shew the steady progress of the colony. In 1851, the revenue was £301,761; the expenditure, £325,032: in 1874 they were respectively £603,790. 2s. 5d., and £613,798, 15s. 10d. The public debt has decreased from £576,499 to £347,264, 4s. 10d., with ample security. In 1851, the imports were valued at £1,330,713; in 1874, £1,873,219, 9s. In these two years, the exports were valued at £1,533,649 and £2,761,837. Sugar, rum, and molasses are the chief exports, and in 1874 had a value of £2,579,246. The trade in valuable native woods—chiefly greenheart—is enlarging, being, in 1871, worth £3900, and in 1874, £32,418. The imports consist mainly of flour, dried salt fish, rice, malt liquor, brandy, machinery, oils, lumber, pork, and manufactured goods. There are 124 sugar estates, 65 plantain (provision) estates, 78 cattle farms, 16 coffee and 9 cocoa-nut estates. In 1874, there were exported 908,887 hogsheads of sugar, 276,606 puncheons of rum, and 179,625 puncheons of molasses. During the same year, 7615 immigrants from the East and West Indies were added to the coolie population. The criminal statistics for 1874 shew a large amount of crime. Out of a population of 218,909, there were 89,965 apprehensions and summonses; and of those convicted there were 17 for murder, 22 for manslaughter, and 7 for attempt of murder.

GUIANA, Dutch, or Surina'm, lies between British and French Guiana, and is separated from the former by the Corentyn, which forms its western boundary, while the Marony separates it from the territories of the latter, and constitutes its eastern boundary. To the n. it is bounded by the Atlantic, and s. by the Acarai mountain-range, which divides it from Brazil. It extends from 2° to 6° n. lat., and from about 53° to about 57° w. long., and has an area of 45,000 square miles. Pop. (1st Jan. 1875) 51,884, of whom 713 were Europeans, 464 Chinese, and 3085 E. Indian coolies. The births (in 1874) were 1548; the deaths, 3364.

Although the physical character, climate, and productions are very nearly the same as those of British Guiana (q. v.), the natural advantages of the colony are not

Digitized by Google

so fully developed, and in the hilly districts in the interior and south, which are held by the Maroons, or runaway slaves, the lands are wholly uncultivated. The rivers all fall into the Atlantic, and the most considerable is the Surinam, which has a course of nearly 800 miles, but is not navigable for large ships many miles above Paramaribo (q. v.), the capital, which is built about 10 miles from its mouth. Dutch laws are in force, and the coinage, weights, and measures of the mother-country are generally used. The government of the colony is administered by a governor-general (nominated by the king of the Netherlands) and a general council of native freeholders. All religions are tolerated, and the Jews have synagogues in different parts of the colony. The Moravian missionaries serve 194 plantations, and had, in 1875, 28,576 persons enrolled.

The principal exports are sugar, coffee, cacao, rum, molasses, many sorts of valuable wood, gums, balsams, and drugs. In 1874, the goods imported were valued at £803,781, and the exports at £218,067. Cleared inward, 204 vessels measuring 26,472 tons; outward, 212, with a tonnage of 27,598. Among the exports were 24,185,508 lbs. sugar, 2,485,483 lbs. cacao, 127,460 lbs. cotton, 57,549 lbs. quassia-wood, 1029 lbs. coffee, 201,780 gallons of rum, and 273,159 gallons of molasses.

There were in all 290 plantations with about 30,000 acres in cultivation. The chief product is sugar; then, in order, cacao, cotton, coffee. The live-stock were 3515 head of cattle, 208 horses, 82 mules, 250 asses, 1184 sheep, 422 goats, and 1733 swine. The revenue (1874) amounted to £101,984, and the expenditure to the same. The letters by mail were 39,114; newspapers and circulars, 39,551. A bill for the emancipation of the slaves was passed 8th August 1862, and came into force 1st July 1863. The compensation given was £25 for each slave.

The Dutch, who were the first European settlers in G., organised trading stations on the coast as early as the year 1580, from which period till 1790, when Demerara and Essequibo fell into the hands of the English, they retained possession of most of Guiana. The present limits of Dutch G. were settled by the Congress of Vienna.

GUIANA, French, includes the districts lying between 2° and 6° n. lat. and 51½° and 54½° w. long., and is bounded on the n. by the Atlantic; on the w. by the Marony River, which separates it from Dutch Guiana, and by the little-known districts lying beyond the Rio-Branco; and on the s. and e. by the river Oyapock and the range of the Tamucumaque Mountains, which separate it from the empire of Brazil. The area, according to the best French authorities (Block, &c.), is 18,000 square leagues, but the boundary-line of French G. is not well defined, and has long been a subject of discussion with the Brazilian and Dutch governments. Pop. (1872) 24,171. In addition to the continental districts, French G. comprises several islands in the immediate vicinity of the coast, the principal of which are Cayenne, in which is situated the capital of the same name, Le Grande Connétable, and Le Petit Connétable. The country is divided into high-lands and low-lands, the former of which commence at the first cataracts of the rivers, and gradually increase in height towards the central districts, which they traverse in a granite mountain-range, which nowhere exceeds an elevation of 1000 feet. The low alluvial lands, which extend from the cartaracts to the Atlantic, are at present mostly covered with vast forests, but the soil is well adapted to the cultivation both of grain of every kind, and all the products of tropical vegetation. Among the 20 navigable streams or rivers, the principal are the Marony, lying to the west, and the Oyapock to the east of Cayenne, the navigation of which is rendered difficult from the numerous cataracts and rapids by which they are obstructed. The overflowing of the rivers gives rise at various points in lower French G. to swamps or marshy savannas, which are covered with forests or mango-trees and palms, while in other parts lakes are formed, the most extensive of which are those of Mapecucu, Macari, and Mapa.

French G. has a rainy season, which lasts with short intermissions from November to June; and the heat is less oppressive than in most places in the West Indies, in consequence of the influence of the trade-winds, which bring with them the temperate moisture of the Atlantic. The thermometer seldom rises above 90° or falls below 75°.

The chief products and exports are choice woods for ornamental purposes, rice, maize, coffee, cacao, sugar, cotton, nutmeg, cloves, and pepper.

Digitized by Google

French G. or Cayenne, which was first occupied by France in 1633, is now divided into 14 communes comprised under the two cantons or districts of Cayenne and Sinnamary, and placed under the command of a governor assisted by a privy council. A recent French budget stood charged with the sum of barely 184,500 francs for ordinary expenses of government in Guiana, and 2,000,000 francs for the penal settlements at Cayenne. The administration of justice is centered in the tribunal or Imperial Court at Cayenne, the chief town of the province, and is under the jurisdiction of a president, assisted by counsel, auditors, and notaries. There are 9 free elementary schools in the colony, giving instruction to 1100 children, which are under the superintendence and management of the clergy of the Romish Church, of which the majority of the population are members, although various forms of faith are tolerated, and supported at the charge of the state.

In accordance with an imperial decree of 1854, Guiana has been made the principal seat of the penal settlements of the mother-country, which are maintained at Cayenne at the national charge. All persons sentenced to eight years' hard labor, are condemned, on the expiration of their sentence, to reside for the remainder of their lives in the colony, unless when they are specially pardoned, in which case they are seldom allowed to return to France. Grants of lands, with the restitution of civil rights, may be accorded by the local authorities as a recompense for good conduct; but the discipline is in all cases severe, and the labor heavy and continuous. The mortality among the prisoners is believed to be very great, but the French government does not include the death-rate of G. in its otherwise very full tables of mortality.

GUIANA BARK, French, the bark of *Portlandia hexandra*, also called *Couterea speciosa*, a tree of the natural order *Cinchonaceæ*, with opposite ovate leaves, and corymbs of very large purple flowers, a native of Guiana. The bark is esteemed a very powerful febrifuge, and the value of the widely known medicine, called *Warburg's Fever Drops*, is believed to depend mainly upon it.

GUICCIARDINI, Francesco, an Italian statesman and historian, was born of noble parentage at Florence in 1482. The combined studies of law and literature engrossed his earliest attention, and were cultivated with such signal success, that before he reached the age of 23, he was elected professor of law by the Signoria of Florence, and acquired, at the same time, a reputation of great skill as a legal practitioner. His knowledge of international law and tact in the conduct of public affairs, caused him to be selected in 1512, by the Signoria, as ambassador to the court of Ferdinand, king of Aragon. During a period of two years, he discharged his diplomatic duties with consummate ability. On his return to Florence, he was received with every mark of public approval, and in 1525 was despatched by the republic to receive at Cortona Pope Leo X. This sharp-sighted pontiff at once secured G.'s services, and committed to him the government of Modena and Reggio, and finally of Parma. Clement VII. continued to shower dignities on G., and appointed him, with unlimited powers, governor of the Romagna, and finally of Bologna. On the accession of Paul III., G. resigned all his dignities, and after 18 years of papal service, returned to Florence, where Alexander de' Medici had just been thrust on the citizens as their sovereign by Charles V. On the assassination of Alexander, G. promoted materially the elevation of Cosmo de' Medici; but meeting with no special favor from that prince, he withdrew from Florence to his villa at Arcetri, where he commenced his famous work, "La Storia d' Italia." He died in 1540, before its completion. In 1561, 21 years after his death, the first sixteen books of his history were published, and three years later, four additional books appeared. The work is considered a standard of classical historical writing, independent of its value as a minute and faithful record of the period it embraces, from 1490 to 1534. A magnificent Italian edition was published at Freyburg 1775—1776, four vols. 4to, strictly in accordance with the manuscripts deposited in the Magliabecchi library at Florence, and another at Pisa, 1819, ten volumes 8vo, edited by Rosini. In 1857—1858, there appeared at Florence "Opere inedite di Francesco Guicciardini," comprising a series of aphorisms and discourses on the Florentine Institutions, in the form of dialogue, recovered from the MSS. in the family archives.

GUICOWAR, or "the Herdsman," the designation of a powerful Mahratta prince, whose dominions at the present time include most of Guzerat (q. v.), with

Digitized by Google

Baroda for capital. The G. originally, as the name denotes, was an officer in the establishment of the rajahs of Satara, the supreme rulers of the Mahrattas (q. v.), and after a time rose high in rank from his military services, being ultimately appointed hereditary second in command of the Mahratta armies, of which the command-in-chief was vested in the family of Sindia. Pelajee, who became G. in 1721, by predatory excursions gradually acquired authority over Guzerat; and his son Damajee, who succeeded in 1732, still further extended the bounds of this ample dominion. The latter then threw off his allegiance to the Peishwa, but being taken prisoner by treachery, he was compelled to yield one half of his dominions, and do homage for the other half. Anund Rao, who ascended the throne in 1800, was the first prince of the line who had intercourse with the British Indian government; and it is worthy of remark that, down to the present time, the relations of the British with these Mahratta princes have been uninterruptedly friendly. The two powers came into contact on the occasion of a civil war between the reigning prince and an illegitimate brother who aspired to the throne; and in consideration of the aid afforded him by the Bombay government, the G. agreed by treaty to disband his Arab soldiers, and receive a British subsidiary force, 15th March 1802. This was effected, not without some disturbance on the part of the refractory soldiery; and various other agreements having been made from time to time, the whole of them were included in a treaty of general defensive alliance, 21st April 1805, by which a permanent British subsidiary force is maintained by the Guicowar. This prince held himself aloof from the disputes between the British government and the other four great Mahratta chiefs, but in 1816 he became involved in a quarrel with the Peishwa with respect to some districts claimed by each. The Peishwa caused the ambassador of the G., an able and upright minister, to be treacherously assassinated; and refusing the demand of the British Resident (who was bound by the treaty of 1805 to aid the G.), that his infamous agent should be given up, became involved in hostilities with the Calcutta government, which terminated in the destruction of his state and power. Syajee Rao, who ascended the throne in 1819, abolished suttee in 1840. See BARODA.

GUIDES, in military affairs, are usually persons drawn from the country in which an army is encamped. A sufficient body of intelligent men is collected at head-quarters, to enable one or more to be sent with every detachment of troops which leaves the camp. A guide should be quick of eye, experienced in the topography of the country, and, above all, faithful. As, however, guides must on most occasions be drawn from the midst of a hostile population, and have probably only a pecuniary interest in serving well, their conduct is always watched with the utmost jealousy, death being awarded as the punishment for the least departure from trustworthiness. Any treason or incompetence on the part of a guide might involve the most disastrous consequences to a whole expedition. In the French army, a considerable corps of cavalry and infantry bear the name, but the name only, of "guides." They were first formed in 1744, as a small company of messengers on active service. The number was gradually increased until the time of Napoleon I., who formed them into a guard of 10,000 strong.

GUIDO, Alessandro, an Italian poet, was born at Pavia in 1650. Literature and poetry engrossed his earliest attention, and to the taste and ability of his first pieces, he owed the notice of the Duke of Pavia, whose favor he further secured by the talent he evinced in setting his verses to fine spirited airs of his own composition. In 1685, with the sanction of the duke, he set out to Rome, where his kind patron assigned him apartments in the Farnese palace. He was fortunate enough to obtain the friendship of Christina, queen of Sweden, and composed, at her desire, the pastoral drama of "Endimione," the princess condescending to be his fellow-laborer in the work. He died at Rome in 1717. The dramas of G. fail in sweetness and affection, but are interesting and elevated in sentiment. As a lyrical poet G. ranks very high.

GUIDO ARETINO, so called from his birthplace, Arezzo, was a monk of the Benedictine order, and flourished about the year 1030, but neither the date of his birth nor death is known. He has the reputation of being the inventor of musical notation, and the regenerator of music. The circumstances which led to G.'s invention are differently stated; but the most reliable account seems to be, that on one

Digitized by Google

occasion while chanting with the monastery choir a hymn in honor of St. John, he was struck with the gradual and regularly ascending tones of the opening syllabic sounds of each hemistich, in the three first verses:

Ut queant laxis — *re*-sonare fibris
Mi-ra gestorum — *fa*-muli tnorum
Sol-ve polluti — *la*-bii reatum, &c.

With the intuitive foresight of genius, he instantly, we are told, comprehended the fitness of these sounds to form a new and perfect system of solfeggio, and forthwith proceeded to mature and systemise this idea. On introducing his new theory into practice among the youthful choristers of the monastery, the experiment proved entirely successful. The fame of G.'s musical invention drew upon him the attention of the pope (John XX.), who invited him to Rome. G. repaired thither, and obtained a very gratifying reception. The pope himself found pleasure in becoming a student of the new system, under the guidance of its founder and teacher. Ill health, however, compelled G. to return to the pure and bracing climate of his birthplace, and, re-entering the monastery of Pomposa, he there tranquilly ended his days. G. has left some interesting writings, explanatory of his musical doctrines, viz., the "Micrologus;" and the "Argumentum Novi Cantus Inveniendi."

GUIDO RENI, a celebrated painter of the Bolognese school, was born at Bologna in 1575, and at first aimed at the sombre coarse strength of Caravaggio's creations, but subsequently followed the more refined and ideal school of the Caracci, previous to finally striking out a style for himself. His works are extremely numerous, and the majority reflect a sentiment of fervent spiritualism, more characteristic of the devotion of the early Bolognese school, than of the later spirit infused by the Caracci, the founders of the modern standard of Bolognese art. G. was unhappily an infatuated gambler, and with the view of replenishing his often-squandered finances, produced with extreme rapidity many inferior works undeserving his name. He died in 1642. Amongst his best productions are, "The Crucifixion of St Peter," a magnificent work in the Vatican Museum; the "Crucifixion," in the church of St Lorenzo, in Lucina, Rome; and the famous "Portrait of Beatrice Cenci," one of the most interesting paintings in Rome. The "Aurora" of G., on the roof of one of the halls of the Rospigliosi Palace, is a fresco of world-wide fame, and is considered the greatest of his works.

GUIDON—The standard borne by regiments of light cavalry; it is broad at one end, nearly pointed at the other, and usually of silk.

GUIENNE, the name of one of the 32 provinces into which France, previous to the Revolution, was divided. It comprehended the territory now formed by the departments of Gironde, Lot, Dordogne, Aveyron and portions of Tarn-et-Garonne, and Lot-et-Garonne, and formed with Gascony (q. v.) what was originally the country of Aquitania, of which name G. is a corruption. Its earlier history is described under Aquitania (q. v.)

GUIGNES, Joseph De, born at Pontoise, 19th October 1721, acquired a great reputation as an orientalist, at a time when the acquisition of Eastern languages was a matter of no small difficulty. Chiefly on account of his thorough knowledge of Chinese, he was appointed interpreter for oriental languages in the Bibliothèque du Roi. G. died at Paris, 19th March 1800. His great work, "L'Historie Générale des Huns, Turcs, Mogols, et autres Tartares occidentaux, avant et depuis J. C. jusqu'à present" (Paris, 1756—1758), is a rare specimen of human industry and research, and of which his countrymen are justly proud. De G. also contributed a history of Tartary to the new edition of the "Bibliothèque Orientale" of D'Herbelot (1777—1779). —His son CHRÉTIEN-LOUIS-JOSEPH, born at Paris, August 25, 1759, was also a very distinguished oriental scholar, and published a Chinese Dictionary (Paris, 1813), by the orders of Napoleon I. He died at Paris, March 9, 1845.

GUIJA'R, or Guixar, a lake of Central America, in the north-west of the state of San Salvador, is 60 miles in circumference, and encloses a large island, which abounds in game, and contains the ruins of what must formerly have been a large town.

GUILANDI'NA, a genus of shrubs of the natural order *Leguminosæ*, sub-order

Digitized by Google

Cæsalpiniceæ, having pinnate leaves, and remarkable for the stony hardness of their seeds, the coating of which is so silicious that they are said even to strike fire with flint. The seeds are used for beads and for children's marbles. *G. Bonduc* is the best known species, and is of very wide geographic distribution, although, like the rest of the species, growing only in the warm parts of the world. It is called the *Bonduc*, and the *Nicker Tree*, and its seeds, which are often thrown ashore on the coasts of Scotland and Ireland, are called *Molucca Beans*. The cotyledons are very bitter, and are much used in India for the cure of intermittent fevers.

GUI'LDFORD, a market-town and parliamentary and municipal borough of England, capital of the county of Surrey, is situated in a depression in the North Downs, on the navigable river Wey, 30 miles south-west of London. Here the Reading and Reigate Branch of the South-Eastern Railway crosses the Direct Portsmouth line. The town consists mainly of one street, running along the steep east side of the Wey, crossed here by an old bridge of four arches, and is distinguished by a remarkable air of order and cleanliness. Its streets are rich in quaint old gables, overhanging panelled fronts, and long latticed windows. The chief buildings are the castle, a fine ruin, in the early Norman style; Archbishop Abbot's hospital, in which reside a master, 12 brothers, and 8 sisters; the church of the Holy Trinity, with several memorable monuments; St Mary's, an interesting specimen of the Transition style, and one of the oldest and most remarkable churches in the county; the Grammar School founded by Edward VI.; the town hall and the corn-market. A county hall and assize court was erected in 1862, and a county hospital in 1863—1866. G. is now chiefly famous for its grain market, the "Surrey wheats" being celebrated. It has paper, powder, and corn mills; breweries, brick-fields, coach-works, and two iron-foundries. G. now returns one member to parliament instead of two, as formerly Pop. (1871) 9801.

This ancient town is first mentioned by name in the will of Alfred the Great, who bequeaths it to Ethelwald, his nephew. In the time of the Confessor, the town and manor were included among the demesnes of the kings of England. Henry II., John, and Henry III. frequently resided here.

GUILDHALL, an important public building in London, which may be regarded as the town-hall, and is the place of assembly of several courts, as the Court of Common Council, the Court of Alderman, the Chamberlain's Court, &c., and a police-court presided over by one of the aldermen. The Guildhall of London was formerly situated in Aldermansbury. The original building was erected in 1411, but was almost wholly destroyed by the Great Fire of 1666. In 1789 the Guildhall was rebuilt in its present form. The hall proper is 153 feet in length, 48 in breadth, and 55 in height. It has been famous for centuries for the magnificence of its civic feasts. The first time it was used for this purpose was in 1500 A.D., when Sir John Shaw, goldsmith, who had been knighted on the field of Bosworth, gave here the first lord-mayor's feast. These feasts had formerly been held at Ewees's Hall.

GUILDS (Sax. *gildan*, to pay). Guilds were originally associations of the inhabitants of particular towns, for promoting the common interest of the fraternity. They are said to be of Saxon origin, but unquestionably similar institutions existed at a very early period among the southern nations of Europe, where they were known by the name of Confraternities. In England, guilds were in use during the Saxon rule, and several records are preserved of the purposes of these institutions. The Saxon guilds appear to have resembled our modern friendly societies. On condition of a certain payment, the members were entitled to relief in case of sickness, and to protection from violence. At a later period, guilds were of two kinds, religious and secular. Both classes retained, as a general rule, the principle of mutual relief to the members in sickness; but the former were established for the performance of works of charity, and for the regular observance of certain religious services; while the main object of the latter was the advancement of the commercial interests of the fraternity. In order to the establishment of a guild, religious as well as secular, it was necessary that it should receive the sanction of the sovereign; and in the reign of Henry II., several guilds were subjected to heavy fines, as having been established without that authority. In London, there was a large number of religious guilds. In the reign of Richard II., a guild to the honor of

Digitized by Google

St George the martyr, consisting of an alderman, master, brothers, and sisters, was established at Norwich; and here, it may be observed in passing, that the term alderman was a name for a chief officer or governor in a guild, whence it was extended to an officer of a burgh on the extension of guilds, as noticed below. It having been an orderly virtuous society for the space of thirty years from its erection, King Henry V. confirmed it by letters patent under the Great Seal, made it perpetual, and granted it certain privileges and immunities (Madox, "Firma Burgi"). In like manner, guilds were formed in Bristol, Exeter, and other large towns. These guilds, through the munificence of individuals, by degrees amassed considerable wealth. By Henry VIII. the property and revenues of these religious guilds were seized and perpetually vested in the crown.

The most important branch of this subject is that of the secular guilds, or, as they were styled in the south of Europe, confraternities. These institutions were the germ of the modern burghs or municipal corporations. They consisted originally of the members of some particular trade, united for the purposes of mutual assistance in sickness, and for maintaining the interests of the trade. Thus we have the guild of goldsmiths, of weavers, of cordwainers, of pattern-makers, of spectacle-makers, &c., the names of which are preserved to the present day. Every trade had its separate guild, of which it was necessary that a man should be a member before he was allowed to practise the particular craft. As trade increased in importance, the influence and power of the guilds increased in proportion, until at length the towns or united guilds claimed from the sovereign special rights and privileges—*quod habeant gildam mercatoriam*. The town of Southampton received a charter confirming their liberties as early as Henry II. Liverpool was made a *gilda mercatoria* by Henry III. In the reign of Henry VI., the title used was *communia perpetua* or *corporato*, which phrase has continued to be used in the modern corporations. This title of *communia* appears to have been borrowed from the continent, where, under the title of communities, the towns at a very early period obtained charters declaring their independence, and bestowing on them extensive privileges. —See Robertson's "Charles V.," and Madox, "Firma Burgi."

The exclusive privileges of English and Scottish guilds or corporations are now abolished, as being contrary to public policy; and these associations exist only for mutual beneficiary purposes. Thus, in various boroughs in England, a custom had long prevailed, and by-laws had been made, to the effect that no person, not being free of the borough or of certain of these guilds, should keep a shop for merchandise, or exercise certain trades within the borough; but since 1835, when the Municipal Corporation Reform Act (5 and 6 Will. IV. c. 76, s. 14) passed, every lawful occupation is free, notwithstanding any such custom or by-laws. The exclusive privilege of trading in Scotch burghs was abolished by the statute 9 and 10 Vict. c. 9. For the functions of the Dean of Guild in Scotch burghs, see DEAN OF GUILD.

GUI'LLEMOT (*Uria*), a genus of web-footed birds, of the group *Brachypteræ* (q. v.) or Divers, and included by Linnæus in the genus *Colymbus* (see DIVER), but now more generally ranked among the *Alcadæ* (see AUK) than among the *Colymbidæ* (q. v.) The bill is moderately long, straight, and pointed, as in *Colymbus*, but rather more compressed, and covered with feathers as far as the nostrils; the feet, as in the other *Alcadæ*, are three-toed, having no hind-toe, and entirely webbed. The legs are placed very far back, and are very short, the tibia scarcely appearing beneath the abdomen, so that they are ill adapted for walking, and the posture of the bird on land is erect, even when hatching its egg. The tail is very short. The wings are short, and are moved with great frequency in flight, which, however, the guillemots are able to sustain remarkably well, in consequence of the abundant provision made for aëration of the blood by their very large air-cavities. On the same account, they usually float very high in the water, though when danger approaches, they can sink their bodies under water, till the head, neck, and upper part of the back are alone visible. They excel in diving, and use their wings for progression under water, where they seek their food, which consists chiefly of small fishes and crustaceans. They are seldom seen in the seas of warm latitudes, but are extremely abundant in those of the arctic regions and the colder parts of the temperate zone, particularly in the neighborhood of rocky coasts. The COMMON G., or FOOLISH G., (*U. troile*) is abundant on many parts of the British coasts, breeding even on those of the south of England, although large flocks also arrive in winter from the north.

Digitized by Google

It abounds in all the arctic regions. Its winter migrations extend as far south as the Mediterranean, and in America to New York. It is called Foolish G. from its often suffering itself to be taken by the hand rather than leave the cliffs on which it breeds, and where prodigious numbers may be seen stationed close together on the ledges of rock. The parent birds are said to carry their young on their backs from the high ledges to the water. The entire length of the Common G. is about 18 inches. The Common G. lays only one egg, which has a very thick shell, is pear-shaped, and remarkably large, being more than three inches long. If the egg is destroyed or taken away, another is laid in its stead. The egg is esteemed a delicacy, but the flesh of the bird is coarse. The skin with the feathers is used for clothing in some northern regions. Young birds and eggs are among the objects in pursuit of which the rock-fowlers of the northern coasts scale or descend the most tremendous precipices. Great numbers of the eggs are exported from the coasts of Newfoundland and Labrador.—The BLACK G. (*U. grylle*) is a smaller species, about 14 inches long; the plumage is entirely black in summer, except a large white patch on each wing; but in winter, the under parts are white; the young are mottled or spotted. It is not common on the southern coasts of Britain, but breeds on many of the Scottish islands. It is plentiful in the arctic regions, and is as common in America as in the Old World. It has been called the Greenland Dove. It lays three eggs, often on the bare rock; but if the situation is damp, it piles up for them a curious nest of pebbles.—Other species are enumerated among British birds, but are rare. Several species are peculiar to the northern parts of the Pacific Ocean.

GUILLOCHE, an architectural ornament of Greek origin. It consists of two or more bands or ribbons, crossing and recrossing one another in a regularly repeating pattern. Some of these are simple, and some very complicated.

GUI'LLOTINE, the instrument of decapitation introduced during the French Revolution by the Convention, and named after its supposed inventor, Josephe Ignace Guillotin, a physician (born 1738—died May 26, 1814), who, however, it is ascertained, was only the person who first proposed its adoption. It is composed of two upright posts, grooved on the inside, and connected at the top by a cross beam. In these grooves, a sharp iron blade, placed obliquely, descends by its own weight on the neck of the victim, who is bound to a board laid below. The speed and certainty with which this machine separates the head from the trunk, gives it a great superiority over the axe or sword. The invention of machines of this kind is ascribed to the Persians. In Italy, from the 13th c., it was the privilege of the nobles to be put to death by a machine of this kind, which was called *Mannaia*. Conradin of Swabia was executed by such a machine at Naples, in 1268. An instrument resembling the guillotine was likewise employed in Germany during the middle ages. During the 16th, and till late in the 17th c., a machine called the *Maiden*, which differed but slightly from the guillotine, was employed in Scotland for the purpose of decapitation. That such an apparatus was known and used in France at an earlier period, is proved by the execution of the Duc de Montmorency, who is described as having been executed by a falling axe at Toulouse, in 1632. The Dutch, too, in the 18th c., employed a decapitating machine in executing slaves in their colonies.

GUILTY is the form of verdict given by a jury in criminal cases when the crime charged has been found proved. In England, there are only two verdicts which can be given in such cases—viz., guilty or not guilty; but in Scotland there is an intermediate verdict, called "Not proven," which though in reality a verdict of "not guilty" (and it is so entered in England), yet is allowed to be given by juries when they are not satisfied that sufficient legal evidence has been given, but nevertheless consider there was some foundation for the charge, or at least some ground for suspicion. It has been objected to this verdict that it leaves a stigma on the party; nevertheless, it is firmly adopted in the law and practice of Scotland.

GUIMARAES, one of the most ancient, picturesque, memorable, and beautifully situated towns of Portugal, in the province of Entre Douro e Minho, stands within an amphitheatre of hills covered with the most luxuriant foliage, between the D'Ave and the Arezilla, 12 miles south-east of Braga. Its narrow streets, its broad red balconies and verandas, its walls, part of which are now in the centre of the town, and are surmounted by pointed parapets, and its remains of ancient architecture

Digitized by Google

seen here and there, render the appearance of the town exceedingly striking. G. was the cradle of the Portuguese monarchy, the residence of Count Henriques, and the birth-place, in 1109, of Alfonso Henriques, his son, and the first king of Portugal. Among the most interesting buildings, are the cathedral, founded in 1335; the castle, a Flamboyant structure, surrounded by square towers: and the Dominican convent, with beautiful cloisters of the 14th century. From every elevation in or near the town, magnificent views are obtained. In the vicinity are the Caldas (hot springs) das Taipas, and the Caldas de San Miguel, both finely situated, and well appointed. These springs, which were well known to the Romans, are used chiefly for bathing purposes. They range in temperature from 91° to 120°, are sulphureous, and are said to be very effective in cases of gout and cutaneous disease. G. is celebrated for its currieries and its paper manufacture; it also exports great quantities of dried plums and figs to England. Pop. 6000.

GUI'NEA, the name of a maritime section of Western Africa. It it extends from the neighborhood of the Senegal to the vicinity of Cape Negro, the stream being in lat. 16° n. and long. 16° 33′ w., and the headland in lat. 15° 41′ s. and about long. 11° 40′ e.; and by the equator, which thus intersects it, it is divided into Upper or Northern, and Lower or Southern Guinea. This vast region forms the coasts of the Mandingoes, Ashanti, Dahomey, Benin, Biafra, Loango, Congo, Angola, and Benguela, connecting with the Atlantic even more distant territories by means of its rivers more especially by the Senegal, the Gambia, the Niger, the Old Calabar, the Zaire or Congo, and the Coanza. G. was first visited in 1364 by some French merchant adventurers of Rouen and Dieppe, and first colonised by the Portuguese in 1481, who have retained nominal possession of the whole of Lower G., the chief states of which are Loango (q.v.), Congo (q.v.), Angola (q.v.), and Benguela (q.v.). The Dutch, French, English, Danes, and even the Germans, also established various settlements, or rather factories, particularly in Upper G., the coast of which is now divided into Grain Coast, Ivory Coast, Gold Coast, and Slave Coast. Besides the articles thus designated, the soil yields indigo, pepper, cotton, sugar, and palm-oil. The factories were chiefly established to secure the slave-trade, and after its suppression their commercial importance ceased. Great Britain has ultimately endeavored to make a humane and Christian use of its acquisitions. While keeping a naval squadron off the West African shores to intercept the slaves, in was needful to provide for the liberated cargoes of black men and women. The Sierra Leone (see FREE TOWN and SIERRA LEON) and Gambia settlements were created for this purpose, and here the Wesleyans have many chapels and schools for the natives. For the American settlement, see LIBERIA and MONROVIA. In 1872, the Dutch gave up to England all their possessions on the Gold Coast. In return for this cession, England consented to annul the treaties prohibiting Dutch conquests in Sumatra on the Straits of Malacca. But the king of Ashanti (q. v.) immediately laid claim to Elmina, the capital of the former Dutch possessions, and after a series of intrigues and diplomatic complications, invaded (April 1873) the territory now under the English protectorate. He was at first successful; but the arrival of Sir Garnet Wolseley (October 1873) followed by some British regiments, soon changed the aspect of affairs, and the Ashanti king was forced to retire into his own country, and after numerous defeats, had to suffer the humiliation of seeing his capital, Coomassie (q. v.), reduced to ashes, 10th February 1874. By the treaty which followed his submission, the king of Ashanti renounced all claim either of tribute or homage from any of the tribes within the limits of the Gold Coast.

GUINEA, Gulf of, a portion of the Atlantic Ocean, washes that remarkable bend of Western Africa, which, reckoning from the north, runs first nearly on a parallel, and then nearly in a meridian. It may be regarded as stretching from Cape Palmas, in lat. 4° 22′ n., and long. 7° 44′ w., to Cape Lopez, about lat. 1° s., and in long. 8° 35′ e. At its north-east extremity is the delta of the Niger, between the Bight of Benin on the north-west, and the Bight of Biafra on the south-east. Off its east shore, reckoning from the north, are the islands of Fernando Po, Prince, and St Thomas.

GUINEA, a gold coin formerly current in Britain, derived its name from the fact that the gold from which the first specimens were coined was brought from the Guinea coast in West Africa, and, for the same reason, it originally bore the impres-

Digitized by Google

sion of an elephant. It was first coined during the reign of Charles II., in 1664, and continued in common use till 1817, when it was superseded by the *Sovereign* (q. v.). Its value varied considerably at different periods, but was latterly fixed at twenty-one shillings. It is still customary in Great Britain to estimate professional fees, honoraria of all kinds, complimentary subscriptions, prices of pictures, &c., in guineas; to give a physician three sovereigns and three shillings, rather than three sovereigns alone, or even three sovereigns and five shillings, is supposed to make the transaction differ from a mere mercantile one, and thus veils the sordidness which is fancied to attach to pounds, shillings, and pence.

GUINEA CORN, a name sometimes given to Durra (q. v.); sometimes to another cereal grass, *Penicillaria spicata* or *Pennisetum typhoideum*, very extensively cultivated in Central Africa, and to some extent also in India, where it is called *Brjree*. It is of the tribe *Paniceæ*, and may be regarded as one of the millets. It is a grass with a spike-like cylindrical panicle.

GUINEA FOWL, or Pintado (*Numida*), a genus of gallinaceous birds of the family *Phasianidæ*, having a short, strong bill, the upper mandible vaulted, a warty membrane at the base of the bill, and a wattle hanging down on each side, the head and upper part of the neck generally naked, the forehead surmounted either with a callous or a feathery crest; the back much elevated and arched, the tail short. The species are all natives of Africa and Madagascar. The best known is the common G. F., or Pintado (*N. Meleagris*), with naked head, hard callous casque, and slate-colored plumage, everywhere speckled with round white spots of various sizes. It is common in Guinea, and apparently through all the regions thence to the neighborhood of the Cape of Good Hope; it is found also in more northern parts of Africa, and was known to the ancient Romans, by whom it was called *Meleagris* and *Gallina Numidica*. Its flesh was highly prized by them. In a wild state, the G. F. is generally seen in large flocks. It is not so polygamous as many of the gallinaceous birds, and even in a state of domestication, exhibits the inclination to pair. It is now common in the poultry-yards of most parts of Europe, although it is more adapted to warm than to cold climates, and in Jamaica, has been completely naturalized, so as to be destructive to crops, and to be shot like other game. In Britain, the young are rather troublesome to rear, but the high price borne in the market both by the birds and their eggs, compensates those who keep guinea fowls for profit. The eggs are small, and have a thick strong shell, but are particularly esteemed. Guinea fowls, however, are troublesome in a poultry-yard, from the disposition of the males to attack and tyrannise over other poultry. The G. F. has a peculiar harsh and querulous cry, which it emits with great frequency. There is a white variety of guinea fowl.

GUINEA GRASS (*Panicum Maximum*), a grass of the same genus with Millet (q. v.), a native of the west of Africa, but now naturalised, and extensively cultivated in the West Indies and southern states of America. It does not perish even in the winters of Britain, but is not luxuriant and productive, as in warmer climates. Its height, in favorable moist situations, is from 5 to 10 feet; in dry grounds, it is smaller; it has a much-branched and spreading panicle, long flat leaves, and a somewhat creeping root. In countries favorable to its growth, it is very valuable as food for cattle.—Other species of the same genus are among the most useful pasture and forage grasses of tropical countries.

GUINEA PEPPER, a name which has been variously applied to the seeds or dried fruit of several very different plants, agreeing in their peppery character, and in being the produce of the West of Africa. The name MALAGUETTA (Malagheta, Meleguetta, &c.) PEPPER is generally to be regarded as equivalent with Guinea Pepper, and is at present a frequent designation of *Grains of Paradise* (q. v.); but the capsules or dry berries of *Capsicum frutescens* (see CAPSICUM) are commonly sold by druggists under the name Guinea Pepper; whilst both the names Guinea Pepper and Malagueta Pepper have been applied to the dried fruit of *Cubeba Clusii* (see CUBEBS), and to the seeds of *Habzelia* (or *Xylopia, Æthiopica*, a shrub of the natural order *Anonaceæ*. This last was at one time a considerable article of export from Guinea, and was sometimes called ETHIOPIAN PEPPER. It is now seldom even heard of. It is an aromatic and not extremely pungent condiment.—There is great difficulty in determining which of these

Digitized by Google

kinds is meant in many instances in which the term Guinea Pepper or Malagueta Pepper is employed by the older writers; yet, from the importance of the trade in this article, the name *Grain Coast* was given to a great tract of land in the Bight of Benin, and to it the establishment of the settlements of Grand Bassa and Cape Palmas is due. Up to the close of the 18th c., Guinea Pepper continued in request, when the peppers of the East drove it from the market.

GUINEA-PIG. See CAVY.

GUINEA-WORM, known also as *Filaria Medinensis*, or *F. Dracunculus*, is a parasitic animal that seems to have been known from the earliest times. Plutarch, in his "Symposiacon" (Table-talk), quotes a passage from the geographer and philosopher Agatharchides of Cnidus, who lived in the second century before our era, which seems clearly to refer to this worm; and it has been argued with great plausibility that the "fiery serpents" which attacked the Israelites in the desert were in reality Guinea or Medina worms. This view of the "fiery serpents" was propounded by Bartholin in his Commentary, and Küchenmeister, one of our highest authorities on parasitic animals, adduces the following arguments in its support. The Hebrew words which in our version are translated "fiery serpents" are *Nechaschim Seraphim*; the former word is correctly translated "serpents;" while *seraphim*, derived from the wood *saraph*, can signify nothing more than *ex qui comburit*; and it is clear that a species of animal is referred to which is distinguished by the inflammability of its bite, or generally by the inflammation which its presence causes. "That in ancient times the Filaria [or Guinea-worm] was reckoned amongst the serpents on account of its snake-like form, is proved at once by the Greek name *drakontion* (Lat. *dracunculus*), a species of snake which had something fabulous and inexplicable about it. The inflammatory pain and swelling which occurred with the breaking out of the worm are certainly very well expressed by *seraphim*; while the mortality amongst the Israelites is easily explained by their ignorance of the treatment, and the dangerous symptoms occurring in consequence of the breaking of the worm, which, according to some authors, may be immediately fatal. Only in the last portion of the way through the desert of Zin towards Mount Hor, but especially on the way from Hor towards Oboth, for which journey they required several months, did the Israelites come into the true district of the Medina-worm—namely, the central and eastern portion of Arabia Petræa. This entire march they would undoubtedly have passed over within the period of incubation of this worm (two months to one year). Here the *Filariæ* (or Guinea-worms) first broke up, with violent inflammatory pains. Thus, then, the Israelites contracted these worms, which are still indigenous in Arabia Patræa; and this worm-province may consequently be of importance and interest to geographers in the determination of the course of travel in the fortieth year of the Israelites' wanderings." ("On Parasites," vol. i. pp. 892—898.

Our knowledge of the natural history of this worm is still very deficient, and we are at present only acquainted with the female. The body of this animal is slender, cylindrical, and somewhat compressed, and is of the thickness of pack-thread, except at the posterior extremity, where it is somewhat attenuated. It is opaque, of a milk-white color; on each side there is a longitudinal line; and when examined by the microscope, it is seen to be marked with numerous transverse strie. The anterior extremity is obtuse, and the mouth circular, and beset with four acute spines (but the number, nature, arrangement, and even existence of these spines are points on which helminthologists differ). The length of the worm varies from less than half a foot to three yards. On examining an adult specimen, extracted by Malgaigne in Paris in 1854, Robin found no trace of intestine, or of any organ except a very thin sheath (a uterus or oviduct), which was filled with young animals rolled up in coils, with the tail occasionally projecting outwards. In these young animals, we can trace the course of the intestinal canal, which apparently becomes subsequently obliterated by the excessive development of the generative organs and the eggs.

This worm is indigenous only in certain hot countries, and its geographical distribution is regulated by laws into which we have no insight. Küchenmeister mentions the following places as especially nortorious for its occurrence: Senegal, Gaboon, the banks of the Ganges, Bombay, the peninsula of India, Persia, Arabia Petræa, the south coast of the Red Sea, the region round the Caspian Sea, Upper

Digitized by Google

Egypt, Abyssinia, certain districts of Nubia, and Guinea. It has been introduced into certain parts of America by negro slaves.

The disorder occasioned by these worms frequently becomes an epidemic in years of heavy rain, and especially in marshy districts. It appears also to be connected with the season, being especially prevalent in the East Indies during the rainy season and in Upper Egypt shortly after the regular inundation of the Nile.

The mode of production of this parasite in the human body is not known with certainty. The probability is, that the young animals, while still very minute, penetrate the skin, although by what mechanism they can effect their lodgment, we do not know. Carter relates a case which strongly supports this view. Fifty children in a school at Bombay went to bathe in a pool, and 21 of them were attacked by the Guinea-worm, some of them having four or five worms. Moreover, it is well known that negroes, who are in the habit of entering the water more frequently than the whites, and generally have their feet naked, are far more liable to be attacked than Europeans. The part of the body in which the worm usually manifests itself also accords with this view. M'Gregor states that in 172 cases it occurred 124 times in the feet, 33 times in the legs, 11 times in the thighs, twice in the hands, and twice elsewhere.

Having gained an entrance into the body, the Guinea-worm takes a considerable time to be developed. This period varies from two months to a year or even two years. The presence of the worm often produces no annoyance for a considerable time after it has been detected; at other times, it gives rise to emaciation, and possibly even death from exhaustion. As a general rule, the vesicles caused by the inflammation excited by the presence of the worm open spontaneously in a few days, and two or three inches of the anterior end of the animal come forth. This end is gently pulled, and coiled round a little roll of linen or a small stick, and this is fastened over the wound with sticking-plaster and a compress. The extraction is repeated twice a day by rotating the substance round which the worm is twisted, and the operation is often not completed in less than two, three, or more months. From the most ancient times, the tearing of the worm has been regarded as a very dangerous accident. It undoubtedly gives rise to violent swelling, fever, and sleeplessness; and if we are to trust the statements of some of the older observers, shortening and deformities of the legs, lingering fistula, mortification, and death (sometimes even sudden death) must be reckoned amongst the probable consequences of breaking the worm.

Although the ordinary seat of this worm is the subcutaneous cellular tissue, it has been found in the tongue, in the layers of the mesentery behind the liver, and under the conjunctiva of the eye. Small *Filariæ* of a different species have occasionally been found in the lens of the human eye.

GUINEGATE, Battle of, or, more familiarly, the *Battle of the Spurs*, was fought at Guinegate, not far from Tournai, in the province of Hainault, Belgium, 16th August 1513, between the English, under Henry VIII., assisted by a considerable body of troops headed by the Emperor Maximilian, and the French, under the Duc de Longueville. The latter were defeated. The battle received its familiar designation from the circumstance of the French knights having made better use of their *spurs* than their *swords*.

GUINGAMP, a town of France, in the department of Côtes-du-Nord, is situated in an extensive plain, on the Trieux, in the midst of pleasing scenery, 20 miles west-north-west of St Brieuc. It was formerly the capital of the duchy of Penthièvre, and was surrounded by walls, part of which still remain. The site of the castle of the dukes of Penthièvre is now planted with trees, and serves as a promenade. G. has a college, a thread-factory, and several tanneries. Pop. (1872) 6545.

GUIPU'SCOA, the smallest, but the most densely peopled of the Basque Provinces (q.v.).

GUI'SBOROUGH, a market-town of the North Riding of Yorkshire, 5 miles from the mouth of the Tees, and 40 miles north of York. It is connected with the Stockton and Darlington branch of the North-eastern Railway. The town lies at the foot of the Cleveland Hills, consists chiefly of one main street of good houses, has several churches, grammar and other schools, almshouses, and market-house.

Digitized by Google

The earliest alum-works in England were established here about the year 1606. There is a trade in wool. Rope-making, brick and tile making, and tanning are carried on. The recent development of the iron-stone mining in the neighborhood has brought a large number of miners and others to reside in and about the town, so that, since 1861, the population has greatly increased. A rich monastery once stood here, of which a small part still remains, built in 1119 by Robert de Brus, lord of the town. At the time of the Reformation, this was one of the wealthiest and most magnificent monastic institutions in the kingdom. Recent excavations have brought to light many interesting antiquities. Among other objects, the workmen came upon the remains of an oak coffin, containing a skeleton, which was found to measure 6 feet 8 inches in length. Pop. (1871) 5902.

GUISCARD, Robert, Duke of Apulia and Calabria, the sixth in order of seniority of the twelve sons of Tancred de Hauteville, was born in the year 1015. Tancred's estates in Lower Normandy being insufficient to support such a numerous family his three eldest sons, William, Dagobert, and Humphrey, determined to seek their fortunes in the wars of Italy. By good-fortune, courage, and wiles, William gained possession of Apulia; and Robert, desirous of sharing his brothers' fortunes, followed them to Italy with a small band of adventurers. Here he distinguished himself so highly in various battles, that, after the death of William and Humphrey, he was proclaimed Count of Apulia. G. next conquered Calabria, in the possession of which he was confirmed by Pope Nicholas II., who, but a short time before, had excommunicated him on account of his many acts of violence. G., from motives of gratitude, bound himself to pay an annual tribute to the Roman see. The feudal superiority still claimed by the papal see over Naples dates from this period. G. now despatched his youngest brother Roger, at the head of 300 warriors, to conquer Sicily, the possession of which had been promised to him by the pope. Roger, in 1060, took Messina, and in the following year the two brothers defeated the Saracens at Enna. Roger eventually conquered the whole island, and became first Count of Sicily. Meanwhile, Robert gradually gained possession of the towns that still remained in the hands of the Saracens, among others, Salerno and Bari, and thus established what was till 1860 the kingdom of Naples. He would have carried his victorious standard in other directions, had he not been excommunicated by Gregory VII., on account of his inroad into Beneventum. Having become involved in the affairs of Greece by the marriage of his daughter Helena with Constantine Ducas, son and heir of Michael VII., he despatched his son Bohemond to undertake the conquest of Corfu, while he himself hastened to Durazzo, and before the walls of that city gained a brilliant victory over the Greek emperor, Alexius Comnenus. He now marched through Epirus to Thessalonica, and had nearly reached Constantinople, when he received information that the Emperor Henry IV. had made an inroad into Italy. He immediately hastened back, after intrusting the chief command to Bohemond, compelled Henry to retreat, and liberated the pope, who was besieged in the castle of St Angelo. He then returned to Epirus, defeated the Greeks in several engagements, took possession of some islands in the Archipelago, and was on the point of advancing a second time to Constantinople, when he died at Cephalonia, 17th July 1085. His remains were buried at Venusa; his sons Bohemond and Roger inherited his possessions: the former received Tarentum; the latter, Apulia. G. was not only a hero and a conqueror, but a patron of the arts and sciences. Compare Gualtier d'Arc, "Histoire des Conquêtes des Normands en Italie, en Sicile, et en Grèce" (Paris, 1830).

GUISE, the name of a branch of the ducal family of Lorraine, distinguished in the history of France and Europe during two centuries. It derives its name from the little town of Guise, in the department of Aisne (situated on the Oise.) The following are its most remarkable members:

CLAUDE OF LORRAINE, first Duke of Guise, Peer of France, Grand Huntsman, Count d'Aumale, Marquis of Mayenne and Elbeuf, Baron of Joinville, &c., was the fifth son of René II., Duke of Lorraine, and was born at the château of Condé, October 20, 1496. He left Lorraine on account of a quarrel with his elder brother, accompanied Francis I. to Italy, and received twenty-two wounds at the battle of Marignan, 1515. Eight years later, he drove the Germans from Champagne. In 1542 he fought in Flanders under the Duke of Orleans. He was favored by the king,

Digitized by Google

for his valor and talent. He married Antoinette of Bourbon, by whom he had twelve children, of whom eight were sons. His daughter Mary was the wife of James V. of Scotland, and mother of Mary, Queen of Scots. He is reported to have died of poison, April 1550.

François of Lorraine, second Duke of G., son of the preceding, was born February 17, 1519. As a general, he acquired European renown. He distinguished himself at Montmedy (1542), Landrecies (1543), St Dizier (1544), Boulogne (1545), and attracted the attention of France by his defence of Metz, besieged for two months by Charles V., who, after firing 11,000 balls, and losing 30,000 men, was obliged to raise the siege (1553). He added to his reputation at Renti (1554), and in 1556 took command of the expedition against Naples. This expedition failed through treachery; but the duke, having been made lieutenant-general of France, retrieved his reputation by taking Calais, Guines, and Ham, which were in possession of the English, and were considered impregnable. His military successes were ended by the peace of 1559. His niece, Mary Stuart, being the wife of Francis II. he became the highest power in the state, and the head of the Catholic party. The death of the king, and a strong party against him, drove him from the court, but he was soon recalled, to take the command against the Huguenots, who had taken several important towns, and were committing great ravages. He retook Rouen, and conquered at Dreux (1562). Maréchal St Andre was killed, the Prince of Condé and the Constable taken prisoners. G., the greatest of his name, was assassinated before Orleans, February 24, 1563. He had a taste for literature, and his memoirs, written by himself, have much historic interest.

Henri I. of Lorraine, third Duke of G., was born December 31, 1550. The death of his father placed him at the head of the Catholic party. Ambition and vengeance both stimulated him to action. At the age of 16, he distinguished himself in fighting against the Turks in Hungary. Three years later, he fought with the Huguenots at Jarnac (March 1569) and Moncontour (October 1569), and in the same year forced Coligny to raise the siege of Poitiers. He aspired to the hand of Marguerite of Valois, but, to appease the anger of the king, married Catherine of Clèves, 1570. Disgusted with the favors granted to Protestants at the court, he retired, but returned, and was engaged in the massacre of St Bartholomew, August 24, 1572, in which he saw the dead body of Coligny thrown from a window into the courtyard at his feet. In 1575, fighting with the Huguenots, he was wounded in the face, whence he received the name of *Balafré* (scarred), a designation born also by his father from a similar circumstance. He formed the famous League—ostensibly for the defence of the church, really to raise himself to the throne of Charlemagne. The king coquetted with both parties. G. conquered Henri of Navarre, but the king refused him entrance to Paris. The people rose in his favor, and he might have been king, but he negotiated. He was promised all the powers which he demanded, but the king caused him to be massacred in the palace, and is said to have kicked his lifeless body. His brother the cardinal was also killed. Their bodies were burned, and the ashes scattered to the winds, December 23, 1588.

Henri II. of Lorraine, fifth Duke of G., was born April 4, 1614. He was destined for the church, and at the age of twelve possessed nine abbeys; at fifteen, he was Archbishop of Reims, but on the death of his elder brother he quitted a calling he detested, and succeeded to the dukedom. Handsome, chivalric, brave, he was a true specimen of the ancient paladin, and celebrated for his numerous gallantries. Loved by Anne de Gonzague, princess of Mantua, he capriciously abandoned her, joined the party of the Comte de Soissons, and married the widow of the Comte de Bossut. Having joined the league against Richelieu, he was condemned by the parliament of Paris to capital punishment, but took refuge in Germany. On the death of Louis XIII., he returned to France disgusted with his wife, whose fortune he had spent, and proposed to marry Mademoiselle de Pons, one of the queen's maids of honor. He fought in the campaigns of 1644 and 1645 as a volunteer, and then repaired to Rome to get a divorce, but failed. Hearing of the revolt of Naples against Spain, under Massaniello, he set off for that city, in the true spirit of knight-errantry, to conquer a kingdom with his sword for the bride he still hoped to gain. Passing in a felucca through the Spanish fleet, G. entered Naples in December 1647, and was received with the utmost enthusiasm; but his gallantries, the envy of the

Digitized by Google

nobles, and jealousy of France, caused him to be betrayed, in April 1648, to the Spaniards, and he was carried a prisoner to Spain. Demanded by Condé, he was set at liberty in 1652, and joined, with Condé, the enemies of the court and of Mazarin at Bordeaux. Two months later, he had betrayed his allies, and was at Paris with the king, but misfortune still followed him, and he found that his mistress, for whom he had endured so much, was false, and that with his own esquire. Finding himself an object of ridicule at Paris, he attempted to return to Naples, but failed; returned to Paris, was made grand chamberlain, there directed the magnificent fêtes of Louis XIV., and died without children in 1664.

GUISE, a town of the department of Aisne, France, situated on the left bank of the Oise, 37 miles north-north-east from Soissons. It is walled, and otherwise fortified. It is an ancient town, and was of much consequence in the early wars of France. Within the town are the ruins of a castle, from which the famous Dukes of Guise (q. v.) derived their title. G. is now a place of considerable commercial and industrial activity; has linen and cotton manufactures, tanneries, &c., weekly markets, and eight annual fairs. Pop. (1872) 5402.

GUITA'R, a musical stringed instrument, somewhat like the lute, particularly well adapted for accompanying the human voice, and much esteemed in Spain and Italy. It has six strings, and the sound is produced by the fingers of the right hand twitching the strings, while the fingers of the left hand make the notes of the music on the finger-board, which has frets across it like the lyre. The three highest strings of the guitar are always of gut, and the three lowest are of silk spun over with silvered wire. The greatest virtuosi on the guitar were Guiliani, Sor, Zoechi, Stoll, and Horetzsky.

GUIZOT, François Pierre Guillaume, a French statesman and historian, was born at Nîmes, October 4, 1787. His parents were Protestants; his father, who was an advocate, perished on the scaffold, April 8, 1794, and his mother soon afterwards went, with her two sons, to Geneva, where G. received his education. In 1805, he went to Paris, and devoted himself to literature. His first work, the "Nouveau Dictionnaire Universel des Synonymes de la Langue Française" (2 vols.; 4th ed. Paris, 1848), appeared in 1809; the introduction reveals a very methodical mind. The next seven years were spent in laborious literary activity. After the second Restoration, he became general secretary to the Ministry of the Interior, afterwards to the Ministry of Justice. On the retirement of Barbé-Marbois, G. tendered his resignation, and was first appointed *maître des requêtes*, afterwards councillor of state. G. contributed to the dissolution of the *Chambre Introuvable*, by writing a memorial which was placed in the hands of Louis XVIII. by Decazes. The latter committed to him the general direction of the administration of the *communes* and *départements* (1819). His writings from 1820 to 1822 are entitled "Du Gouvernement de la France depuis la Restauration et du Ministère Actuel" (1821). "Histoire des Origines du Gouvernement Représentatif," containing his lectures at the Sorbonne (where he held the position of lecturer on history) of 1820—1822 (new ed. 1852). Government forbade his lectures in 1824, and G. again betook himself to literature. In conjunction with several other men of letters, he published the important "Collection des Mémoires Relatifs á l'Histoire de France, depuis la Fondation de la Monarchie jusqu'au 13*me* Siècle" (31 vols., Paris 1823–1833); and the "Collection des Mémoires Relatifs à l'Histoire de la Révolution d'Angleterre" (26 vols., Paris 1828). He likewise edited several works of other authors, with introductions, annotations, and additions, such as Letourneur's translation of Shakspeare (12 vols., Paris 1821), Hallam's "History of England," and Mably's "Observations sur l'Histoire de France," followed by the "Essais sur l'Histoire de France." In addition to all these, he published his "Histoire de la Révolution d'Angleterre" (2 vols., Paris, 1826; 4th ed. 1845), and edited the "Encyclopédie Progressive," and the "Revue Française." In the following year, the Martignac ministry granted him permission to resume his course of lectures on history. These were attended by a large and enthusiastic audience, and gave rise to several historical works of great value, published under the collective title of "Cours d'Histoire Moderne" (1828—1830); among others, the "Histoire de la Civilisation en France depuis la Chute de l'Empire Romain jusqu'à la Révolution Française" (5 vols., Paris, 1828—1830; 5th ed. 1845), and the "Histoire Générale de la Civilisation en Europe," &c., which serves as an introduction

Digitized by Google

to the former work. On the 1st March 1839 he again took his place in the council of state, and in January 1880 was elected by the town of Lisieux, which he continued to represent in the chamber.

After the July revolution, G. became successively Minister of Public Instruction and Minister of the Interior, an office which he held, with two interruptions, till 1836. In this capacity he did much for the improvement of educational institutions, particularly the primary schools. On the breaking out of the Eastern disturbances in the beginning of the year 1840, under Soult's administration, G. was sent as ambassador to London. After Soult's retirement, in September 1847, he became the official leader of the cabinet, which maintained its ground, as the organ of Louis Philippe's policy, till the February revolution of 1848, and by its conduct both in home and foreign affairs, did much to bring constitutional government into disrepute, and to hasten the overthrow of the Orleans monarchy. As a statesman, G. in carrying out his systematic and repressive line of policy, proved himself stiff, one-sided, and latterly obdurate; from these qualities, as well as from his cold and disagreeable manner, he was always unpopular to the last degree with the nation. As a man of rectitude and austere morals, he never enriched himself at the public cost; but nevertheless, from political motives, he allowed others to do so during his administration, in the most flagrant manner. After having effected his escape from Paris, he retired to London, where he was received with great respect. In April 1849, he published a circular "Guizot à ses Amis," in which he offered his services to the electors of France, but ineffectually. In the following November, he returned to Paris, where he continued to labor in conjunction with the heads of the monarchical parties. After a short visit to Louis Philippe in England in June 1850, he came forward in Paris as the main promoter of the fusion, and wrote likewise in the "Assemblée Nationale." The *coup d'état* of the 2d December 1851 put an end to this career; and G. returned to England. By founding the "Comités Historiques," by bringing about the publication of important historical documents, and by his own writings and lectures, he did much to extend a taste for historical studies in France. In 1837, he was intrusted by the government of the United States with the task of writing a history of Washington. His work, published under the title "Vie, Correspondance, et Ecrits de Washington" (2 vols., Paris, 1839-1840,) procured him the honor of having his portrait placed in the Chamber of Representatives at Washington. After the February Revolution, G. published several political treatises, more or less important, some of which at least are very interesting to Englishmen, such as "Revolution d'Angleterre," and "Monk, Chute de la Republique." He likewise wrote "Meditations et Etudes Morales sur la Religion, la Philosophie," &c. (1852); "Corneille et son Temps" 1852); "Shakespeare et son Temps" (1859). In 1858, appeared his "Mémoires pour servir à l'Histoire de mon Temps." His publication, in 1861, defending the temporal power of the pope, was a strange one for a Protestant. Among the most important of his later works are "Meditations sur l'Etat Actuel de la Religion Chretienne" (1865); "Melanges Biographiques et Litteraires" (1868); "Melanges Politiques et Historiques" (1869), &c. G. was thrice married; his first two wives were accomplished women, and not unknown in literature. He died Sept. 12, 1874. After his death was published "L'Histoire de France depuis les Temps les plus recules jusqu'en 1789; racontee à mes Petits-Enfants." His son, MAURICE GUILLAUME, has shewn by his "Menandre, Etude Historique sur la Comedie et la Societe Grecques" (1855), that he is not destitute of his father's genius.

GUIZOTIA. See RAM-TIL.

GUJERAT, or Guzerat, a walled town of the Punjab, stands on the right side of the Cheuab, and is a place of some military and political importance, being on the great route between Attock and Lahore. Here, in 1849, a Sikh army of 60,000 men was utterly defeated by a much less numerous British force. Pop. (1868) 15,907.—For the territory called GUZERAT, see under that heading.

GULDEN. See FLORIN.

GULES (Fr. *gueules*, the mouth and throat, hence red. Other origins are given, such as the Persian *ghul*, a rose or rose-color, which seems more probable than the Hebrew *gulude*, a piece of red cloth, from which Mackenzie derives it; it being

Digitized by Google

scarcely likely that it came from a Semitic source), the term by which the color red is known in heraldry. In engraving, it is marked by perpendicular lines traced from the top of the shield to the bottom. See HERALDRY. It is supposed to indicate valor, magnanimity, and the like, and is regarded as the most honorable heraldic color.

GULF STREAM AND OCEAN-CURRENTS. The most important and best known of the great ocean-currents derives its name from the Gulf of Mexico, out of which it flows, between the coast of Florida on the one side, and Cuba and the Bahama Islands and shoals on the other. With a breadth of about 50 miles in its narrowest portion, it has a velocity at times of five miles an hour, pouring along like an immense torrent. This great ocean-river flows in a north-easterly direction along the American coast, gradually widening its current and diminishing its velocity, until it reaches the island and Banks of Newfoundland, when it sweeps across the Atlantic, and divides into two portions, one of which turns eastward towards the Azores and coast of Marocco, while the other laves the shores of the British Islands and Norway, and can be perceived on the southern borders of Iceland and Spitzbergen, nearly as far east as Nova Zembla.

The waters of the Gulf Stream are of a deep indigo blue, with boundaries sharply defined against the light green of the seas through which it passes in its early course. It abounds in masses of sea-weed, torn from the coral rocks of the strait through which it passes when it has its greatest power and velocity; while in its warm current may be seen myriads of fish and of animalculæ. As this great stream pours out of the Gulf of Mexico, it has a warmth of 84° in summer, being 4° higher than that of the ocean at the equator. In mid-Atlantic, opposite Nova Scotia, it has fallen at all seasons only about 14°; while the British Islands and north-western coasts of Europe, at a distance of 4000 miles from the Gulf, are bathed with waters heated under a tropical sun, and have their temperatures raised in winter about 30° above the normal temperature of the latitudes. In mid-winter, off the inclement coasts of America, between Cape Hatteras and Newfoundland, ships beaten back from their harbors by fierce north-westers, until loaded down with ice and in danger of foundering, turn their prows to the east, and seek relief and comfort in the Gulf Stream. A bank of fog rising like a wall, caused by the condensation of warm vapors meeting a colder atmosphere, marks the edge of the stream. The water suddenly changes from green to blue, the climate from winter to summer; and this change is so sudden, that when a ship is crossing the line, a difference of 30° of temperature has been marked between the bow and the stern.

The great differences of temperature between the western shores of Europe and the eastern shores of America have been attributed, too largely, perhaps, to the influence of the Gulf Stream. There is no doubt that such an immense body of heated water in the North-eastern Atlantic must raise the temperature of the atmosphere, and that to this importation of the effects of tropical sunshine by sea is due, to a certain extent, Ireland's perpetual green, the soft moist climate of England and Scotland, and the fact that the harbors of the western and northern coasts of Norway, as far east as Varanger Fjord, remain open, when the Baltic, much further south, is a sheet of ice. England, clothed in perennial verdure, and Scotland, where the grass grows during eleven months of the year, are in the same latitude as the frozen and horrible coast of Labrador. Norway is opposite Greenland; and Lisbon, where frost is scarcely known, is in the same latitude as Washington, where the Potomac river, a mile in breadth, sometimes freezes over in a single night. This difference is to be ascribed, not to the Gulf Stream alone, but to that in conjunction with the prevailing south-westerly winds. The Mediterranean, exposed to no cold currents from the arctic regions, bearing bergs and fields of ice, is a constant receiver and distributor of heat, and modifies the temperature of adjacent regions. North America, on the contrary, is exposed along its eastern shore to a great current from the Polar Seas, running inside and counter to the Gulf Stream, and coming loaded with ice from the northern regions: and while the continent narrows toward the tropics, it grows broad in the polar regions, from which come the cold north-westers, the prevailing winds during the wintry season.

The effect of the Gulf Stream upon temperature has been nowhere more strikingly observed than in high northern latitudes. Where the warm stream from the

Digitized by Google

south-west meets the Arctic current in the lat. of Iceland, a difference of 17° has been observed.

In treating of the cause or causes of the Gulf Stream, we must take a general view of ocean-currents. Taken altogether, they form a connected system which has been aptly compared to the circulation of the blood. The two prime movers are differences of temperature and prevalent winds. Sea-water of average saltness does not freeze until it is cooled down to about 28°; and, unlike fresh water, it continues to grow heavier down to that point. The effect of the intense cold of the polar regions is thus to cause a constant sinking down of the surface-water, and to establish a current of ice-cold water along the bottom towards the equator; while to supply the place of what sinks down, an indraught or northward flow takes place on the surface, which brings the warm water of the temperate and tropical regions toward the poles. This is the general theory of the *vertical* circulation of the ocean—a circulation which might almost be assumed from the well-known laws of the flow of liquids, and which recent observations have established as a fact. The general prevalence of cold currents along the bed of the ocean from the poles to the equator is now beyond dispute. The soundings taken recently by H.M.S *Challenger* shew the temperature of the bottom water between Sombrero in the West Indies and Teneriffe to vary from 34°·4 to 35°·5; while at the equator it is in some places still lower, being only 32°·4. This is held to prove that the Antartic bottom current extends to the equator and beyond it. Motion once thus begun, however, is differently modified in each locality by the shape of the coasts, by prevalent winds, and other circumstances. But one cause which modifies all currents that tend either north or south, is the daily rotation of the earth. In the very same way that the rotation of the earth gives the trade-winds their peculiar directions (see WINDS), it causes the cold currents coming from the poles to turn towards the south-west, and the surface-currents from the south to take a northeast direction. At the equator, any spot on the surface is moving eastward at the rate of 1000 miles an hour; at 60° north latitude, the velocity is only one half. Thus, the water of a current starting from the equator northward, is constantly coming to places where the bottom under it has less and less eastward velocity. But, by the law of inertia, the water tends to retain the same velocity eastward with which it started, and thus it moves to the east of north—shooting ahead, as it were, of the bottom over which it is flowing, as a rider does whose horse slackens his pace. The contrary happens to a stream flowing from north to south. In this case, the eastward motion or motal inertia of the water is too slow for the parts of the bottom to which it successively comes; the bottom slips in a manner from under it, and it falls to west of south.—This, in combination with the action of opposing coasts, accounts for the circular sweep which many of the currents make, returning partly into themselves.

Different in origin from this vertical circulation, though partly mixed up with it, is the *horizontal* circulation caused by prevalent winds. The best example of this is the Equatorial Current, which sets from the west coast of Africa to the east coast of Brazil, and which is owing to the action of the trade-winds. Currents caused by winds are called "drift-currents," in opposition to the deeper seated "stream-currents." In order to feed this westerly equatorial current, there spring up two *in-draught* currents, which also follow the prevailing winds of their respective regions—the one from the north along the west coast of Portugal and Morocco, the other from the Cape of Good Hope along the west coast of Africa, as far as the Gulf of Guinea. When the equatorial current reaches the coast of Brazil, it divides into two branches. One proceeds southwards, turning gradually eastwards across the Atlantic until it falls in with the northern in-draught from the Cape of Good Hope. The other branch is deflected northwards into the Caribbean Sea and the Gulf of Mexico. The water thus driven into this pent-up sea now rushes with accumulated momentum through the strait or gulf between Florida and the Bahamas, and forms the famous Gulf Stream.

It has usually been held that the Gulf Stream extends across the Atlantic to the shores of Northern Europe, and is the cause of the mild and moist climate enjoyed by the western parts of that continent. The opinion, however, is beginning to prevail that, as a distinct current, the Gulf Stream ceases in the middle of the North Atlantic, its waters being by this time thinned out to a mere film, and its initial

Digitized by Google

velocity and distinctive heat having been dissipated. That warm waters from tropical seas are brought to the coasts of Britain, and even into the polar seas beyond, is proved by drift-wood, seeds, and fruits from the West Indies being frequently cast ashore on the Hebrides, the north of Norway, and Spitzbergen. But this is accounted for by the general flow of the surface-water towards the poles, forming part of the vertical oceanic circulation; a flow which receives an eastward deflection as it proceeds northwards, in the way above explained. This general set of the surface-water is further promoted by the prevalence of south-westerly winds, which maintain a pretty constant north-east *drift* over the whole surface of the north-eastern portion of the Atlantic. In this way, although the Gulf Stream may have lost its original impetus, a large portion of the super-heated water which it brings into the centre of the Atlantic is carried to the shores of Europe and into the Arctic Sea.

The Pacific Ocean has also its great equatorial or trade-wind current, but there is no great basin like the Gulf of Mexico to gather the waters of another Gulf Stream. A portion of the equatorial current passes northward along the shores of China and Japan; a portion passes through the narrow channels of the Indian seas, and another portion turns southward toward Australia, and New Zealand, affecting, doubtless, the isothermal lines in those latitudes, and returning in counter-currents to Cape Horn, and even passing around it into the Atlantic. While thus a portion of the great counter or Polar current of the South Pacific sweeps around Cape Horn, another portion passes up the western coast of South America across the equator to 5° n. lat.; and its coolness is sensibly felt, and was carefully observed by Baron Humboldt on the coast of Peru. The currents in the waters between the Pacific and Indian Oceans are also variously affected by the monsoons, and in some places run six months in one direction, and six months in the opposite, clearly proving that they are mainly dependent upon the direction and force of the winds. A chart of ocean currents was published by the Admiralty in 1872, which proves beyond a doubt that it is almost wholly to the prevailing winds we must look for an explanation of ocean currents.

At first sight, it appears incredible that a current of water should force its way through the ocean with sharply defined boundaries, and a peculiar color, temperature, and inhabitants, like a great river flowing between its banks, for thousands of miles, and against the force of counter-currents, which even cross its course, passing under by their superior density, until it loses its momentum on the shores of distant continents, or spreads out its warm flood on the bosom of northern seas. But a closer observation will satisfy us that all this is in accordance with the laws of hydrodynamics. At the confluence of the clear waters of the Mississippi with the turbid current of the Missouri, the two rivers do not at once unite, but run side by side with a sharply defined boundary between them for many a league. So great rivers running into the ocean are rivers still, far out at sea. The current of the Rio de la Plata, which drains the southern portion of South America, can be perceived 200 miles from land; and the Amazon sweep far into the Atlantic, though gradually bent northwardly by the great trade-wind current, and then carried along the coast, to help, with the Orinoco, to swell the waters of the Gulf of Mexico; so that the waters of the Amazon, the Orinoco, the Rio Grande, and the Mississippi, all join to swell the Gulf Stream.

The channel of the Gulf Stream in its narrower portion is of great depth. From observations made by the *Challenger* in 1873, in that part of the stream between Bermuda and New York, it is seen the Gulf Stream is there about 100 fathoms deep, and 80 miles in width. The probability of its having hollowed out for itself a well-defined channel like the bed of a river, is shewn by a sudden increase of depth at its border, where deep-sea soundings have been made; but so little can be known of the effect of currents upon a line of 20,000 feet in length, and which requires several hours to run off the reel, that we cannot place implicit reliance on such observations.

More important observations on the courses and influence of these currents have been lately undertaken by dropping bottles containing the date, latitude, and longitude, in all parts of the ocean. These bottles, when found upon a coast thousands of miles distant, give some indication of the direction and velocity of the currents that have brought them; but such testimony is not infallible. The bottle may be speeded

Digitized by Google

by contrary winds, blown into counter-currents, or whirled about for months in eddies. A bottle thrown overboard in the Indian Ocean might reach the island of Spitzbergen, *viâ* the Gulf of Mexico; but there are many chances that it would be thrown out of the regular current, and be picked up on the shores of New Zealand or the coast of Peru. See Dr Franklin's "Maritime Observations," Pownall's "Hydraulic and Nautical Observations," Humboldt's "Atlas Geographique et Physique," Johnston's "Physical Atlas," Maury's "Physical Geography of the Seas, and Wind and Current Charts," and Admiralty wind and current charts for Pacific, Atlantic, and Indian Oceans.

GULFWEED (*Sargassum*), a genus of sea-weeds (*Algæ*) of the sub-order *Fucaceæ*, of which two species (*S. vulgare* and *S. baccíferum*) are found floating in immense quantities in some parts of the Atlantic, Pacific, and Indian Oceans. They are tropical plants, although sometimes carried by winds and currents to the British coasts. The frond is very long, and is furnished with distinct, stalked, nerved leaves, and simple axillary stalked air-vessels. The receptacles are linear, in small axillary clusters or racemes. The trivial name *baccíferum* applied to one of the species, is derived from the berry-like appearance of the air-vessels. The G. has only been found floating, but there is reason to think that it is at first attached to the bottom of comparatively shallow parts of the sea. It floats in large fields, or more frequently in long yellow lines in the direction of the wind. In crossing the Atlantic, its presence is regarded as a sure indication of the Gulf Stream, by which it is wafted northward and eastward. Where the Gulf Stream is deflected from the banks of Newfoundland eastward, and sends off its more southern branch towards the Azores, is situated the *Sargasso Sea*, "that great bank of weeds, which so vividly occupied the imagination of Christopher Columbus, and which Oviedo calls the sea-weed meadows" (*Humboldt*). The quantity of floating sea-weed is often such as to impede the progress of ships. Multitudes of small marine animals accompany it, with fishes ready to prey on them.—The G. is eaten in China; and in other parts of the East also, it is used in salads and as a pickle.

GULIE'LMA, a genus of South American palms, with pinnate leaves (entire in young plants), natives of the lower mountain-ranges of Peru and New Granada. One species, *G. speciosa*, is much planted by the Indians of the Amazon district and of Guiana and Venezuela, near their villages, and supplies them with food and other necessaries. It is often 60 feet high, having an erect slender stem, encircled with many rings of needle-like spines, and numerous drooping leaves forming a nearly spherical crown. It is variously called *Papunha*, *Paripou*, &c., and sometimes *Peach Palm*.

GULL (*Larus*), a genus of web-footed birds, of the family *Laridæ* (q. v.), inhabitants of the sea-coasts of all parts of the world. The feet have three toes in front completely united by a web, and a small hind-toe not included in the web, and sometimes altogether wanting. The wings are long and pointed. Gulls have great power of wing, and fly apparently with ease against a storm, during the continuance of which they generally fly low, whether over sea or land, but in fine weather soar higher in the air, in which they seem to delight in performing the most varied and beautiful evolutions. They descend with great rapidity to seize prey from the surface of the water or at a small depth; but they are not good divers, and the fishes which they catch are chiefly those which, like the herring and others of the same family, swim near the surface. They are very voracious. Their food consists of almost anything animal. Many of them are wholly or partially migratory, breeding in colder regions than those which they inhabit in winter. In general they lay only two or three eggs, which are large for the size of the bird.

Many of the gulls are frequent visitors of inland districts, ascending rivers, and hovering over them in quest of prey as over the sea. Some of them are also often to be seen in meadows and ploughed fields, seeking for worms and other such food. It is a common notion in Britain that the appearance of gulls in inland districts betokens stormy weather. But in America, the migrations of some of the species between the northern seas and the Gulf of Mexico are performed, not only along the Atlantic coast, but by the great lakes and the valleys of the Ohio and the Mississippi, and a few occasionally remain and breed near these inland waters. Large flocks of a species of gull (*L. Serranus*) frequent the lakes of the high table-lands of Peru.

Digitized by Google

Some at least of the larger gulls break the shells of molluscs by taking them up to a sufficient height in the air, and dropping them on a rock. This interesting fact is attested by Audubon, the American ornithologist, as having come under his own observation, and he mentions an instance in which a gull, finding the shell not broken by the fall, carried it up a second and a third time, and each time higher than the former.

The flesh of gulls is rather coarse, but that of the young is in request on many northern coasts as an article of food, and is salted for winter use. The eggs of certain species, such as the Black-headed Gull, are said to be very palatable, and are collected in great quantities in some places where these birds breed in large numbers.

The plumage of gulls is generally in great part white, variously mixed with gray, slate-color, brown, and black. The white, in some species, assumes a rosy tint in the breeding season; and the head of some becomes black. The differences of plumage, according to age and season and sex, are very considerable, and have led to many errors as to species.

One of the most common British species is the BLACK-HEADED GULL (*L. ridibundus*), the whole length of which is about 16 inches; another is the COMMON GULL or SEA-MEW (*L. canus*), mostly of a gray color above and white below, fully 18 inches long; the HERRING GULL (*L. argentatus*), a still larger species, is common on rocky coasts; the KITTIWAKE (*L. tridactylus*, or *L. rissa*), rather smaller than the first-named species, gray and white, destitute of hind-toe, is plentiful where the coast is girt with rocky precipices, on the narrow ledges of which it makes its nest; its young and eggs are among the chief objects of pursuit of the rock-fowlers; the LESSER BLACK-BACKED GULL (*L. fuscus*), about 23 inches long, is pretty common, at least in the north; the GREAT BLACK-BACKED GULL, or WAGEL (*L. marinus*), nearly 30 inches long, is not rare; and the GLAUCOUS GULL, or BURGOMASTER (*L. glacus*), scarcely inferior to it in size, though by some supposed to be identical with the Great Black-backed species, of a pale bluish-gray color above, and white below, is a winter visitant from the arctic regions. This species seems to have acquired its name of Burgomaster from the superiority which, in virtue of its size and strength, it asserts over most of the smaller birds of the northern seas, compelling them to relinquish prey at its approach. Some of the British species of gull are also common in North America, as the Herring Gull, the Great Black-backed Gull, and the Kittiwake; but the COMMON AMERICAN GULL (*L. zonorhynchus*) is not found on the eastern shores of the Atlantic.

GULLET. See ŒSOPHAGUS.

GULU'NCHA (*Cocculus cordifolius*), a plant of the same genus which yields Calumba (q.v.), extensively used in the East Indies as a tonic and febrifuge. It is largely cultivated in some parts. It is a climber, with heart-shaped leaves. It exhibits a wonderful tenacity of life. When it has acquired the diameter of half an inch, it is not unusual to cut from the main stem a portion of from 20 to 30 feet in length, when the part sustained by the branches of the tree sends down threads to the ground, which take root, and become new stems. To plant it, a few yards of the stem are merely made into a coil, and hung on the branch of a tree (Tennent's *Ceylon*).

GUM, a general term applied to certain exudations from trees and plants, which are very different in their chemical characters and their general properties. In its strictest sense, gum is a substance which dissolves in water, forming a transparent mucilage; it is insoluble in ether, alcohol, and oils, either fixed or volatile, and is convertible into oxalic acid by the action of sulphuric acid. The gums belonging to this class are:

1. *Gum Arabic*, which is gathered from the stems of *Acacia Arabica* and *Acacia vera*, two leguminous trees found in Northern Africa, and in some parts of Asia. It varies in color from a light straw to a garnet red, and is more or less transparent; the lightest is always the best. It is imported from Barbary and Turkey.

2. *Barbary Gum*, a dark-colored variety, also imported from the Morocco coast. It has some qualities which render it particularly valuable to confectioners, in the manufacture of lozenges, &c. It is the produce of another species of acacia, *A. gummifera*.

Digitized by Google

8. *Gum Godda*, an inferior quality of Barbary gum.

4. *Gum Senegal* is in fine large, round tears, generally larger than the finest Gum Arabic; it is, however, darker in color, being a sherry brown, with sometimes a slight pinkish tint perceptible on the surface of the drops or tears. It is found generally in the tropical parts of the western coast of Africa, and is yielded by two species of acacia, viz., *A. Senegal* and *A. Seyal*. It is much valued for dressing various textile fabrics, such as muslins and silks, and is also used by confectioners for the finest kinds of lozenges, &c. The *Acacia Arabica* is also found in the East Indies, and is supposed to yield, with other species, the following gums known in commerce.

5. *Gum Gattie*, which is imported very largely, and is produced in the Deccan, Concan, and in Gujerat.

6. *Gum Babool*, an inferior gum imported from Bengal.

7. *East Indian Gum*, a tolerably good variety, imported from Bombay.

8. *Gum Oomrawuttee*, an inferior variety, from the province of Oomrawuttee.

These East Indian gums are all dark colored, and are much inferior to those produced in Africa; they are, however, extensively imported into the ports of London and Liverpool; over 200 tons are annually received into those ports.

The gums above described principally consist of a material which chemists have called *Arabin*, from its being the chief constituent of Gum Arabic. We now come to another class of gums, in which another material, called *Bassorin*, from its being first noticed in an analysis of *Gum Bassora*, is more or less present. These are:

1. *Gum Tragacanth*, or Dragon, yielded by the leguminous shrub *Astragalus tragacantha*; it was known to the ancient Greeks under the name of *tragakantha*. The finest pieces are in flakes, from an inch to an inch and a half in length, and from half an inch to an inch in width. This gum is more or less white, and nearly opaque, that which is whitest and most opeque being the best. It is only partly soluble in water, forming a white paste, instead of a transparent solution; with vinegar or dilute acetic acid, it also forms a similar paste, and is a valuable cement, holding light materials with great tenacity. It is used as a stiffening material for various textile fabrics, and is much valued for this purpose, where it is not desired to give gloss to the material. We receive it chiefly from Smyrna and Constantinople. It is mostly produced in Northern Persia and Asia Minor.

2. *Gum Kuteera*, yielded by *Sterculia urens* on the Coromandel coast. It is now only an occasional import, though formerly a considerable quantity was brought to this country.

3. *Gum Bassora*.—This is imported from Bassora; hence its name; but although long known in commerce, it has not been satisfactorily determined what plant produces it. Only a very small quantity reaches this country from time to time.

4. *African or Sierra Leone Tragacanth*.—This is occasionally imported in small quantities from Western Africa, and is produced by *Sterculia tragacantha*.

Besides the true gums, there are the

GUM-RESINS, which are much more mixed in their chemical constituents; in general terms, however, they may be said to consist of certain resins soluble in alcohol, and of the true gum, so that it requires both water and alcohol to dissolve them entirely. They are chiefly used in medicine and perfumery, and may be said to form a connecting-link between the true gums and the true resins, commercially speaking. The principal are:

1. *Gum Asafœtida*. See ASAFŒTIDA. 2. *Gum Benzoin* or *Benjamin*. See BENZOIN. 3. *Gum Styrax* or *Storax* is another sweet-scented gum resin, produced by *Sytrax officinalis* in Turkey in Asia. It is usually liquid, of the consistence of treacle, and a blackish or dark-grey color. It is also used in perfumery. 4. *Gum Sagapenum*, another medicinal gum with unpleasant garlic-like odor, dark-brown color, and a soft consistency. It is not known what plant produces it, but it is generally supposed to be obtained from *Ferula*. 5. *Gum Galbanum*. See GALBANUM. 6. *Gum Opoyanax* is yielded by the roots of another umbelliferous plant, *Opopanax chironium*. It comes from the Levant in reddish-yellow lumps of a disagreeable smell. Its only use is in medicine, chiefly for plasters. 7. *Gum Ammoniacum*. See AMMONIACUM. 8. *Gum Myrrh* is a very sweet-smelling gum resin, which exudes from the stems of an Abyssinian shrub, the *Balsamodendron*

Digitized by Google

myrrha. Two distinct kinds are known in commerce, the Turkish and the East Indian; the former is the better. They are both in irregular-shaped small lumps, rarely exceeding the size of a walnut, of a reddish-brown color, rather lighter in the Turkish sort. Considerable quantities are used in medicine, and in perfumery for dentifrices, washes for the teeth, &c., in consequence of its being supposed to possess considerable antiseptic properties, and for the agreeable odor it imparts to the breath. From 15 to 20 tons are imported annually. 9. *Gum Scammony.*—This is obtained from incisions made purposely in the crown of the great tap-root of the *Convolvulus scammonia*, which is bored for the purpose. It is of a dark sap-green color, inclining to greenish-gray, in large and small cakes, and in irregular fragments. Its use is extensive as a mild and safe purgative for children, but scarcely any drug has been so uncertain in its operation, owing to the excessive adulteration practised upon it by the Turks previous to its shipment. This has now been obviated by importing the root itself, and extracting the gum in this country.

There are many other gums well known, but these are the ones to be had in shops, and for which uses are found in the arts, manufactures, and in medicine. Many also of the true resins, as copal animi, &c., are called gums, but they are strictly *resins*. See RESINS.

Gum-substitutes are manufactured from wheat-starch, farina or potato-starch, sago-flour, and other feculas by baking or roasting, so as to convert the starch into Dextrine (q. v.). This now an important manufacture, in which a large amount of capital is engaged. They are made on a very extensive scale by the Messrs. Laing of Manchester and others, and are largely employed in dressing calicoes and other fabrics, also as a substitute for the more expensive gums in gumming paper, as in the case of postage and receipt stamps, which are made adhesive by dextrine. For this and some other purposes, the *gum* substitutes are superior to the real gums, as they are easily dissolved, and can be spread more equally over a smooth surface. Very large quantities of the starch of potatoes, called farina or potato-flour, are made in this country, and are also imported from the continent to be used in this manufacture.

GUMBINNEN, a thriving town of Prussia, in the province of Prussia, is situated on both banks of the Pissa, one of the affluents of the Pregel, 68 miles east-south-east of Königsberg. It was first regularly laid out in 1724, and owes its rise and prosperity in great measure to the settlement here of many Protestants, chiefly from Salzburg, who were driven from their homes by religious persecution. Among other institutions, the town has a gymnasium, a public library, three Protestant churches, and three hospitals. Woolen-cloth weaving, brewing and distilling, are the branches of manufacture. Pop. (1875) 9116.

GUM-BOIL, an Abscess (q. v.) near the root of a tooth, and discharging itself towards the mucous membrane of the gum; usually superficial, but sometimes more deeply seated in connection with the bone, and causing considerable deformity, with risk of Caries (q. v.) or Necrosis (q. v.). Gum-boil should be treated, in the first instance, by simple protection against cold and external injury; but as soon as the presence of matter can be ascertained, it is usually good practice to give vent to it by a pretty free incision.

GUM TREE. See EUCALYPTUS and TUPELO.

GU'MMEL, a town of Africa, in the state of Bornu, in lat. 12° 38' n., and long. 9° 21' e. In 1851, on the occasion of Dr Barth's first visit to G., he found it a flourishing town, the great entrepôt for the natron-trade, with a weekly market, at which were 800 stalls, offering for sale all sorts of clothing, tools, pottery, victuals, cattle, horses, &., and with a pop. of 10,000; but in 1854, on visiting it on his return journey, he found that, during the interval, it had suffered severely from civil wars, and was then in a state of at least temporary decay.

GUMMING, a disease analogous to *Canker* (q. v.), and like it, very destructive to fruit-trees, but confined to those the sap of which readily produces much gum: as the cherry, plum, peach, apricot, and almond. It is supposed sometimes to originate in wounds, in which a morbid exudation of gum takes place; but it appears to be more frequently occasioned by severe frosts, and to be very much dependent

Digitized by Google

upon causes which induce a general unhealthiness. It very generally terminates in the destruction, not merely of the branch in which it originated, but of the whole tree, although trees in which it is in sure progress sometimes live for years, and meanwhile produce large crops of fruit. A small fungus (*Xæmaspora crocea*), which has been supposed to be the cause of gumming, more probably appears in consequence of it.

GU'MRI, an old town of Russian Armenia, on the site of which the important city and fortress of Alexandrapol—pop. (1867) 17,272—have been built. The site is on the high road to Erivan, and is 60 miles north-west of that town. Alexandrapol is built at an elevation of 5860 feet above sea-level, and here the cold is so intense that men are often frozen to death in the fields.

GU'MTI, a river of India, remarkable, as its name is meant to express, for its windings, rises in a small lake in lat. 28° 35′ n., and long. 80° 10′ e., and after a south-eastern course of 482 miles, enters the Ganges from the left in lat. 25° 29′ n., and long. 83° 15′ e. It is navigable for inland craft as far up as Lucknow, which is fully more than 300 miles above its confluence with the Ganges. At Jaunpore, about 56 miles from the Ganges, it is spanned by a bridge of 16 arches.

GUN, a term applied in its most general application to firearms of any description, but in the more restricted and technical sense to Cannon (q. v.). A gun is a frustum of a right cone, with a cylinder excavated round the axis, to serve as a bore. Close home to the end of this cylinder, the powder is driven, and outside it is the ball to be expelled.

The trunnions are cast in one mass with the piece, and are placed in the second reinforce in such a position that the breech-end of the gun outweighs the muzzle. Their axis is generally about half their diameter below the axis of the piece. This locality has several conveniences; but for the maximum of steadiness in the recoil, it has been shewn that the axes of the trunnions and of the gun should exactly intersect. The use of the trunnions is to suspend the cannon on its carriage in such a manner that it may be readily depressed or elevated, but so that it shall have no horizontal motion which is not shared by the whole carriage.

The vent or touch-hole, the channel through which the charge is fired, is a small cylindrical orifice leading at an angle from the breech of the bore towards the base ring. The explosion within reacts with great force on the lower portion of the vent, and in case of rapid or long-continued firing, soon honeycombs the iron or brass, often dislodging considerable fragments. This, besides diminishing the regularity of the action of the powder on the projectile, would involve danger of bursting if permitted to any great extent. The gun so effected is therefore *touched*, that is, has a new vent constructed. The process consists of drilling a female screw, of larger than the required diameter, in the metal of the gun. Into this matrix, a bar of pure copper is screwed (copper being the metal least liable to fuse under the intense heat of ignited gunpowder), and the vent is then drilled through the copper. Sir A. Dickson devised the following simple mode: he rammed a cartridge of sand firmly into the breech, then filled the vent and all the intersices with molten copper, and had only to bore a hole through the latter to complete the operation. In cases of great urgency, even this simple procedure may be shortened by the insertion of the stem of a tobacco-pipe during the filling; the pipe, when removed, leaves a perfect vent.

With reference to Rifled Cannon, some particulars have already been given under ARMSTRONG GUN, and fuller details will be given under RIFLED ARMS. Under the heading CANNON will be found some details as to various kinds of heavy guns, as well as under the several headings LANCASTER GUN, MORTAR, SHELL-GUN, &c. The history of guns and gunpowder is sketched in the article FIRE-ARMS. The various kinds of small-arms are discussed under their respective heads, as ARQUEBUS, MATCH-LOCK, PISTOL, REVOLVER, RIFLED ARMS.

GUN-BOAT, a small boat or vessel armed with one or more guns of heavy calibre. From its small dimensions, it is capable of running close inshore or up rivers, and from the same cause it has little chance of being hit by a larger vessel at the long range which the carrying power of its guns enables it to maintain. On the outbreak of the Russian war (1854—1856), as the British navy was without a single gun-boat, a large squadron of them was hastily constructed in 1855 and

Digitized by Google

1854, but too late for that special war. From the haste with which they were put together, most of those vessels proved defective. Their tonnage was small; and their armament usually consisted of one 8-inch gun and one 100-pounder Armstrong gun. In the last two wars with China, gun-boats performed excellent service, having penetrated nearly to Peking, and far up the Yang-tze-kiang. Gun-boats in their more modern form are small mastless vessels mounting one large gun in the bow, and propelled by an engine with single or twin screws. The gun is pointed by means of the helm or the screws, and the gun-boat is in fact a floating gun-carriage. The *Staunch*, the first gun-boat built on this principle for our navy, has given her name to the whole class. In our navy these gun-boats carry an armor-piercing gun of 18 tons, on a draught of only 4 feet. But they have been designed to carry even 35-ton guns. Four have lately been built by Messrs Armstrong for the Chinese navy—the Alpha, Beta, Gamma, and Delta; two of these carry a 25-ton gun, and two a gun of over 30 tons. A small flotilla of such gun-boats, protected only by their small size, would be in coast defence formidable opponents even for ironclads. At the beginning of the century the United States had over 250 of these vessels; but the "gun-boat system" was soon abandoned. Some of the continental navies are well provided with gun-boats.

GUN-CARRIAGE is a very important element in the equipment of each piece of ordnance. It requires to be of great strength, and at the same time of considerable weight, in order that the whole apparatus—gun and carriage together—may not be driven backward by the recoil in firing. Field-gun carriages have, besides, to bear an enormous strain in passing at a rapid pace over broken, uneven, or rocky ground. To provide for this severe wear and tear, every part is fitted with the utmost precision, made of well-seasoned material, and on strict mechanical principles. A large department, fitted with splendid machinery, in the Royal Arsenal at Woolwich, called the Royal Carriage Department, is charged with this branch of manufacture for the British service. Carriages are of various kinds, according to the service for which they may be required. When the field-gun is to be moved, the trail-plate is hooked to the LIMBER (q. v.), which converts the gun-carriage and limber into a four-wheeled vehicle, capable of conveying the gun, its tools and ammunition, and several of its gunners. Information relative to certain species of gun-carriages will likewise be found under TRAVERSING PLATFORM. Among modern inventions of war is the Moncrieff or elevating gun-carriage, in which the gun is poised at the end of a lever pivoted on the carriage, and balanced by a heavy counter-weight. Before firing, the gun is raised by mechanism; when fired, its own recoil drives it down upon the carriage. This arrangement enables gun and gunners to lie concealed behind a parapet until the moment of discharge.

GUN-COTTON, a detonating substance invented by Schönbein in 1846, and obtained in the following manner. One part of finely carded cotton is immersed in 15 parts of a mixture of equal measures of strong nitric acid (sp. gr. 1·6) and sulphuric acid (sp. gr. 1·845). The cotton must be completely immersed in the mixture, otherwise it becomes so hot as to undergo immediate decomposition. After a few minutes' immersion, it must be plunged into a large volume of cold water, and then washed till the moist mass ceases to shew any acid reaction when placed on litmus paper. It is then to be carefully dried at a temperature not exceeding 170°.

Any substance containing cellulose, such as tow, linen, saw-dust, paper, &c., may be employed instead of cotton, and the change that takes place in the formation of the explosive compound seems, from the researches of Hadow, to be as follows: the composition of cellulose is represented by the formula $C_{36}H_{20}O_{20}$. In the formation of gun-cotton or *pyroxylin* (derived from *pyr*, fire, and *xylon*, wood), nine equivalents of the hydrogen are replaced by an equal number of equivalents of peroxide of nitrogen (NO_4), so that the formula for the new compound is $C_{36}H_{11}9NO_4,O_{20}$. The fibre, in undergoing this change, increases about 70 per cent. in weight, and acquires perfectly new properties. Although scarcely differing in appearance from unchanged cotton, it may be distinguished from it by its harshness, by the crepitating sound which it yields when pressed by the hand, by its having lost the property of depolarisation which ordinary cotton possesses, and by its electric condition. Iodine dissolved in a solution of iodide of potassium affords a certain means of distinguishing explosive from ordinary cotton. If the former is moistened with this

Digitized by Google

iodine solution, and a little dilute sulphuric acid is subsequently added (one part of the acid to four of water), a yellow color is evolved; while ordinary cotton wool, when similarly treated, assumes a blue color. Its most remarkably property is, however, the facility with which it takes fire, and its rapid and complete combustion. The results of General von Lenk's improvements in the manufacture of gun-cotton, which, however, did not lead to its superseding gunpowder in any one direction, are given in another place. The more recent experiments of Professor Abel, which have been carried on for the last ten years at the Woolwich Arsenal, and are still being continued, have resulted in further improving the manufacture, and also in determining more accurately the properties of gun-cotton. Abel's process consists in steeping cotton-waste in strong nitric and sulphuric acids at a low temperature, and afterwards washing it thoroughly. It is next reduced to a pulp in a common rag-engine (see PAPER), and then in the pulpy condition it is washed again in a large quantity of water to remove every trace of free acid. After that, it is pressed at a low power, and subsequently in a powerful hydraulic press, out of which it comes in so wet a state as to be uninflammable. Gun-cotton can thus be compressed into masses of any shape, as cylinders or cubes, and of any required density or hardness. It can also be converted into the form of paper, or into gun-cotton grains for sporting purposes.

Gun-cotton can now be manufactured so as to keep, there is every reason to believe, with perfect safety in a wet state, and be as good as ever when dried again. The results of some experiments carried on a year or two ago by a government committee at Chatham shewed that when gun-cotton is firmly confined, it exerts a destructive effect equal to about five times that of gunpowder.

Professor Abel has proved that the more thoroughly gun-cotton is compressed, the more perfectly can its action be controlled, and it is now generally used in compact discs for mining purposes; that it is sympathetic, so that, if gently ignited by a spark, in the form of yarn, it smoulders slowly away; if by a flame, it burns up rapidly; and if fired in the compressed state by a detonating fuse, it explodes with great violence, even when unconfined. The most recent and striking discovery regarding it, however, is, that although, as a rule, non-inflammable and non-explosive in the wet state, yet, when fired in this condition with the detonating substance fulminate of mercury, and a little dry gun-cotton or gunpowder, it explodes with as much violence as when it is dry.

While gunpowder does not explode at a lower temperature than 600° F., gun-cotton has been known to do so at 277° F., and cannot be heated to 400° F. without explosion. Gun-cotton produces neither smoke nor fouling when fired, and does not heat the gun so much as gunpowder, though, by the rapidity of its explosion, it strains the barrel more.

GUN-COTTON. During the last few years, great improvements have been effected in the manufacture and application of this material, and in consequence, its use is rapidly extending, especially in Great Britain, where it is found of great advantage in mining operations, owing to its not producing smoke when exploded. For the improvements as well as the invention of gun-cotton, we are chiefly indebted to the Austrians, the most important improvement being that of Baron Lenk, consisting chiefly in the following precautions in the manufacture: 1. A perfect cleansing and drying of the cotton. 2. The use of the most concentrated and purest acids procurable commercially. 3. Steeping the cotton a second time in a mixture of the strong acids. 4. Continuance of this steep for forty-eight hours. 5. A thorough purification of the gun-cotton from free acid by washing in a running stream for several weeks. This may be supplemented by washing in a weak solution of potash, but is not absolutely necessary. The following are the important advantages insured by the new method of making gun-cotton:

For Purposes of Artillery.—1. The same initial velocity of the projectile can be obtained by a charge of gun-cotton one-fourth of the weight of gunpowder. 2. There is no smoke from the explosion of gun-cotton. 3. Gun-cotton does not foul the gun. 4. Gun-cotton does not heat the gun to the injurious degree of gunpowder. 5. Gun-cotton gives the same velocity to the projectile with much smaller recoil of the gun. 6. Gun-cotton will produce the same initial velocity of projectile with a shorter length of barrel. 7. In projectiles of the nature of explosive shells, gun-

Digitized by Google

cotton has the advantage of breaking the shell more equally into much more numerous pieces than gunpowder. 8. When gun-cotton is used in shells instead of gunpowder, a quantity equal in weight to one-third of the latter produces double the explosive force.

For Civil Engineering and Mining.—9. In driving tunnels through hard rock, a charge of gun-cotton of given *size* exerts double the explosive force of gunpowder, so as to render a smaller number of holes necessary. 10. Gun-cotton also may be so used as, in its explosion, to reduce the rock to much smaller pieces than gunpowder, and so facilitate its removal. 11. As gun-cotton produces no smoke, the work can proceed much more rapidly, and with less injury to the health of the miners. 12. In working coal-mines, the advantages of bringing down much larger quantities of material with a given charge, and the absence of smoke in the explosion, enable a much greater quantity of work to be done in a given time at a given cost. 13. The weight of gun-cotton required to produce a given effect in mining is only one-sixth part of the weight of gunpowder. 14. In blasting rock under water the wider range and greater force of a given charge is a great element in cheapening the cost of submarine work. 15. The peculiar local action of gun-cotton, to which the effects of gunpowder shew no analogy, enables the engineer to destroy and remove submarine stones and rocks without the preliminary delay and expense of boring chambers for the charge.

For Military Engineering.—16. The smaller weight of gun-cotton offers great advantages in facility of transport, the weight being one-sixth that of gunpowder. 17. The peculiar localised action of gun-cotton enables the engineer to destroy bridges and palisades, and to remove every kind of obstacle with great facility. 18. For submarine explosion, either in attack or defence, gun-cotton has the advantage of a much wider range of destructive power than gunpowder. 19. For the same purpose, gun-cotton, from its lightness, has the advantage of keeping afloat the water-tight case in which it is contained, while gunpowder sinks it to the bottom.

For Naval Warfare.—20. Where guns are close together, as in the batteries of ships and casemated forts, the absence of smoke removes the great evil of the firing of one gun impeding the aim of the next, and thus gun-cotton facilitates rapid firing. 21. Between-decks also, the absence of smoke allows continuous rapid firing to be maintained. The absence of fouling and of heating are equally advantageous for naval as for military artillery.

General Advantages.—Time, damp, and exposure do not alter its qualities when carefully prepared. Being made in the form of rope, yarn, or, according to the most recent improvement, in compressed discs, accidents cannot arise from spilling as in gunpowder. It is also believed to be free from the danger of spontaneous combustion, but this is perhaps not the case under all circumstances.

The dreadful explosion at the Gun-Cotton Mills, Stowmarket, in August 1871, has thrown doubts on the safety of this substance. With respect to that particular accident, evidence was given to shew that sulphuric acid had been maliciously added to the gun-cotton, although this was not completely proved. Some minor accidents have happened since, caused, so far as we can learn, by carelessness in handling the material. However, the works at Stowmarket have been rebuilt, and gun-cotton appears to be more or less used for mining and quarrying in several parts of England.

GUN FACTORIES, Royal, are government establishments at Woolwich for the construction of great guns for the use of the British army and navy. For a long period there had been at Woolwich a small factory for the manufacture of brass cannon, but guns of cast iron were obtained from private foundries by contract. At last it was determined that government should become in part its own gun-founder, and extensive workshops were erected in 1855–1856. The adoption of the Armstrong wrought-iron gun into general use in the service, in 1859, arrested the further making of cast-iron guns, and occasioned again a great expenditure in the erection of shops and costly machinery, which have since been adapted to the other systems of wrought-iron ordnance adopted into the service under the name of "Woolwich." The factories may now fairly be regarded as among the most remarkable sights in the kingdom. In each department, whatever the process, it is repeated over and

Digitized by Google

over again, till long parallel lines of similar mills are seen, each busily fashioning a separate gun. Iron at red-heat is first wound round a solid core (representing the bore of the future gun), as tape might be round a pencil; and then by the action of successive blows from a steam-hammer (there is one of 100 tons), the strips are welded into a compact cylinder of wrought iron of extreme density. This cylinder, after undergoing several heatings and poundings with the steam-h mmer, is encompassed with wrought-iron rings of immense strength, which are shrunk on, and then transmitted to the boring-mill. Here the proper calibre is imparted to it; in another department, the bore is rifled; in another, the outside of the gun is carefully turned; and in yet another, the whole is polished and browned. A gun is several weeks in its passage through these many processes. By the ingenuity of Sir William Armstrong, the superintendent, and Dr John Anderson, his able assistant, every part of the difficult manufacture has been reduced to a question of machinery. Many thousand guns have to this time been turned out complete, of which upwards of 7000 are now available for military or naval use. The cost of the guns as now made is, on an average, as follows: 12-pounder, £82; 20-pounder, £124; 40-pounder, £206; 70-pounder, £375; 35-ton gun, £2156. The royal gun factory at Woolwich was estimated to cost for 1878—1879 the sum of £203,948, of which £5242 were for management; £78,656 for the wages of artificers and laborers; £12,671 for buildings and machinery; and £104,190 for stores to be consumed in the manufacture of guns.

Much of the machinery now used in the manufacture of guns was originally developed at the engineering and founding establishment of Sir William Armstrong & Co., at Elswick, which was for some time used as an auxiliary and supplement to the gun factory in Woolwich arsenal, the guns being turned out at a contract price, payable after they had passed a rigid inspection. The connection between the government and the Elswick firm ceased in 1863.

GUNDAMU'K, a village of Afghanistan, claims notice merely in connection with the fatal retreat from Cabul in 1842. It was here that the last remnant of the British force, when within 28 miles of the shelter of Jellalabad, was massacred, to the number of 100 soldiers and 300 camp followers, only one man effecting his escape.

GUNDU'K, a river of India, joins the Ganges from the left or north side, opposite to Patna, after a south-east east course of about 400 miles. It is supposed to rise beyond the Himalaya, in lat. 29° 40′ n., and long. 83° 14′ e., while its remotest source within that range is said to be at the foot of Dhwalagiri. After a course of 200 miles, it becomes practicable for boats of considerable burden. Near this point, the river touches the British territory, dividing it for 15 miles from Nepaul.

GUNDULITSCH, Iwan, the most celebrated Serbian poet of earlier times, was the son of Francis Gundulitsch the historian, and was born 8th August, 1588, in the town of Ragusa. After he had completed his primary education and philosophic studies under the Jesuits, he betook himself, and at the age of 21, to the science of jurisprudence, in which he made such rapid advances, that in spite of his youth, he was intrusted with the first offices of the Ragusan republic. He died in 1638. On the 20th December 1838, the bicentenary anniversary of his death, a grand requiem was sung in memory of the poet, in the Academic Church of Agram.—G.'s poetical works, lyrical, dramatic, and epical, are a faithful mirror of the stirring time in which they were composed. He was the earliest dramatic writer of the Slavic race, and the theatre of Ragusa, on which his pieces were performed was the first Slavic theatre. His greatest and most celebrated work is an epic, "The Osmanli," in 20 cantos in which he sings the deeds of Osman II., and the fame of the Poles and their king, Wladislaw IV., in the campaign of 1621. This work was first published at Ragusa in 1826; the latest edition is that of Gaj (Agram, 1844). Of his Dramas, may be mentioned, "Ariadne," "The Rape of Proserpina," "Galatea," "Diana," "Armida," "The Sacrifice of Love," "Ceres," "Cleopatra," "Adonis," and "The Coral;" of his other poems, "Hymn on the Greatness of God," and "The Tears of the afflicted Son." G. also made several translations from the Italian poets.

GUNMAKING, Gun-Trade. Although the terms gunnery and gun relate chiefly to great guns or cannon, the word gunmaking is always applied to the manufacture of small-arms, comprising muskets, rifles, pistols, and carbines. In England, the great seat of this trade was formerly London, whose workmen stood unrivalled

Digitized by Google

throughout Europe for the excellence of their production; but of late years the gun-makers of Birmingham have succeeded, from local advantages, in turning out barrels of proved power, at such a price as to defy competition. Since then, the London makers have confined themselves to "finishing," or putting together, an art requiring the utmost nicety; and even in this, the skilled labor of Dublin and Edinburgh has now nearly equalled them. There are, therefore, several centres now in the United Kingdom whence first-rate arms are to be obtained. America and the leading continental nations are great manufacturers also, and each has its particular excellences. The chief continental gun-factories are at St Etienne, Liège, Vienna, and Suhl.

Machinery has been comparatively slow in being applied to the manufacture of small-arms, but during the last few years it has made giant strides; and now the government manufactory at Enfield, in which numerous ingenious machines have been introduced from the United States, is fitted with every mechanical appliance, and can turn out many thousand arms per annum, each of which so exactly corresponds to pattern, that all the constituent pieces are interchangeable. Barrels, instead of being forged by the hand-hammer, are rolled at once with a uniform pressure, and then welded at one heat. In the United States, barrels are at present made of cast steel, first formed in the solid, and then bored by a succession of borers of increasing diameter. These cast-steel barrels are rapidly superseding all others—at least for sporting purposes—in Great Britain, France, and America. Another favorite modern material for barrels is "laminated steel." See BARREL. Barrels well constructed of laminated steel, resist a bursting pressure of 82,000 lbs. on the square inch one-eighth of an inch thick, whereas common "twist" barrels will only withstand about 34,000 lbs.

When the barrel is finished, however made, it is proofed, under very heavy charges of powder. All non-government barrels made in England must be proofed at the proofing-houses of London or Birmingham; government arms are tested at Enfield.

The portions of the lock (q.v.) are made some of iron and some of steel, either forged by hand, or, as in the great manufactories, stamped out by a powerful machine. The stock is turned by machinery from strong light wood. On all accounts taken together, it is found that no wood is so well adapted as Italian walnut. The finishing or putting together of guns is an art in itself; the utmost attention having to be devoted to everything that will secure solidity, lightness, and the most minute accuracy of fitting. Skilled artificers in the gun-trade command excellent wages: rarely less than 40s., and often as much as £4 a week.

In fitting and finishing, London is generally admitted to stand unequalled; Paris, however, making a good and near second. For barrels, Birmingham, St Etienne, and Liège have the most repute. In all respects, Toledo, once famed for its blades, holds a high character in regard to its guns, both for sporting and military purposes. In the United States, Windsor and Hartford are the leading manufactories, with Harper's Ferry for government arms; but the quality of American workmanship is too often sacrificed to cheapness in the article turned out. The British export trade in small-arms is very great, the return for the year 1875 shewing an exportation of 318,901 stand of all kinds of the value of £655,169.

GUNNEL (*Gunnellus Muræoides*), a genus of fishes of the Blenny (q. v.) family, of more elongated form than the true blennies. The species are pretty numerous, but only one is British, the COMMON or SPOTTED G. or BUTTERFISH (*G. vulgaris*), often to be found in tide-pools on the sea shore; seldom more than six or seven inches long; of a deep olive color, with a row of dark spots on the back, remarkable for the quantity and thickness of the mucous secretion with which it is covered. It is seldom used in Britain except for bait.

GUNNER, in the British army, is the private soldier of the corps of artillery; he receives pay at the rate of 1s. 2½d. per diem: his uniform consists of blue with red facings, and red stripe on the trousers; and his arms consist of a carbine and sword-bayonet.

At the present time, when artillery is used with the utmost skill and science, the training a gunner must undergo, to become thoroughly efficient, is long and arduous. His eye must be sufficiently acute to estimate distances instantly and

Digitized by Google

proximately; and withal, he must possess physical strength capable of sustaining the exertions necessary for the service of heavy guns and the removal of shot and ponderous artillery stores.

Master-gunners are pensioned sergeants of artillery, who are placed in charge of the stores in small towers or forts; they are divided into three classes, of which those in the first class receive 5*s.*, in the second, 3*s.* 6*d.*, and in the third, 2*s.* a day. Master gunners are now borne in the Coast Brigade of Royal Artillery, but the office has much degenerated in importance since it was first created, at least as early as the time of Henry VIII.

In the navy, the *gunner* ranks first among the warrant-officers, and next in order to the navigating sub-lieutenant in regard to taking command of a ship. His pay varies from 2*s.* a day for chief gunners to 5*s.* 6*d.* a day for gunners of the 2d class. His uniform consists of a blue coat, blue cap, and officer's sword. A gunner rises from before the mast by steadiness, sobriety, and intelligence. On appointment, he must satisfy examiners appointed by the Admiralty that he is in all respects qualified. His duties are highly important: he has charge of all powder and artillery stores on board, and is bound to see that the guns are always fully equipped for action. In exercising with the guns, the gunner is instructor of the sailors, and, under the captain, is responsible for their efficiency. The *gunner's-mate* is assistant to the gunner, and stands second among the petty officers. To be confirmed in his rank, he must pass an examination in gunnery on board H.M.S. *Excellent*, at Portsmouth. His pay varies from £39, 10*s.* 10*d.* a year to £34, 12*s.* 7*d.* *Seamen-gunners* are continuous-service sailors, who are trained in gunnery and great-gun exercise. One has the direction of each gun, with ordinary seamen under him to perform the heavy part of working it. A seaman-gunner, if in the 1st class, receives 4*d.* a day beyond his pay as seaman, and 2*d.* a day if in the 2d class.

GUNNERY. Ignorance of the laws of gravity and of other physical circumstances affecting the flight of projectiles, prevented any correct theory of gunnery being arrived at in the earliest ages of artillery. The first author professedly treating on the flight of cannon-shot was Nicolas Tartaglia, a distinguished Italian mathematician, who, in 1537, published his work, "La Nuova Scientia." He had no practical acquaintance with his subject, but his guesses were shrewd and often marvellously near the truth. Among other things he ascertained that no portion of the track described by a ball is a right line, and as a practical aid to artilleriists, he devised the gunner's "Quadrant" (q. v.). After Tartaglia, many philosophers, especially of Italy, theorised on the question, and various tables of ranges, elevations, charges, &c., had been published, all more or less fallacious, when a nearer approach to accuracy appeared in Galileo's "Dialogues on Motion," printed in 1638. The officers who had charge of artillery in actual use were too little gifted with scientific education to deduce theory from practice; and up the time of Robins, who wrote in 1742, but four working-gunners—Collado, Browne, Eldred, and Alderson, of whom the three last were Englishmen—have left treatises of any value on the use of their weapons.

Galileo, in his contributions to physics, had shewn that cannon-shot, or any other projectiles, being affected by the downward force of gravity, would travel in the curve of a parabola, unless affected by the resistance of the air. The philosopher pointed out modes by which the disturbances caused by this resisting medium might be ascertained; but subsequent writers, with the exception of Newton and Bernoulli, till the time of Robins, chose to assume that the atmospherical resistance was but nominal, and boldly asserted that all shot described parabolas in their course. In 1742, Mr Benjamin Robins, who must be considered the real founder of the science, published his "New Principles of Gunnery," a work the result of long and almost exhaustive experiments. He treated of the atmospheric resistance, of the force of gunpowder, of the effects of varying length and weight in guns, and of almost everything which in any way related to the motion of projectiles, carrying the theory of gunnery nearly to perfection. As one result of his experiments, Robins established the law that common shot encountered a resistance from the air during their passage, which increased as the square of the velocity, or very nearly so; and that their courses differed widely from parabolas. By means of the Ballistic Pendulum (q. v), he measured the speed of balls at the very cannon's mouth. Euler, in the latter part

Digitized by Google

of the 18th c., added much to the knowledge of the subject by his commentaries on the work of Robins; as did also the mathematician Hutton.

The theory of gunnery, so far as it can be deduced from the universal laws of motion, without regard to the resistance of the air, falls under the more general head of Projectiles (q. v.). But except in firing bombs, which from their low velocity are not so much affected by the resistance of the air, the mere mathematical theory is of little service. All the real practical rules have been deduced from experiment. The following are a few of the more important results thus arrived at.

For a given charge and weight of projectile, there is a certain length of bore that gives the greatest velocity; the cause being, that with a less length some of the powder is discharged undecomposed, and with a greater, the combustion is finished before the ball leaves the muzzle, so that it has to contend with the friction of the gun without receiving additional impulses. Increase of length, accompanied by proportionate increase of charge, gives increased velocity; but the greater velocity is only in proportion to the cube root of the increased length.

The resistance of the air does not arise merely from the projectile having to displace its own bulk of it as it advances; for in the case of a body moving with great velocity, the air becomes condensed in front of it, while that behind is highly rarified. The displaced air behind does not return freely to fill up the vacuum, until the speed of the ball is reduced to 1400 feet per second; the maximum profitable velocity is calculated to be 1600 feet, and that, or any higher speed, is believed to be reduced to 1400 feet after a course of 400 feet.

The resistance offered to bodies by the air is as their surfaces, i. e., in the case of round or cylindrical shot, as the squares of the diameters; whilst the power of the bodies themselves to overcome resistance is as their weights, or as the cubes of their diameters. Of course balls of like size but different density will produce widely different results. Hence the greater range of solid as compared to hollow shot. Solid shot fired with equal velocities and elevations, range as their weight, the heavier overcoming atmospheric resistance better than the lighter. Shot of equal weight and diameter will range according to their velocities; but not in direct proportion, for the retarding power varies as the square of the velocity. Velocities of shot of equal diameter are as the square roots of the charges.

The diminution in speed caused by atmospheric resistance may be judged of from the following table of the speed of a 32-pounder at different parts of its course; it being premised that a body in vacuo, once started, should move ad infinitum, without decrease of velocity:

Initial velocity,			.....	1600	feet per second.
Velocity	500	yards from gun	.....	1126	"
"	1000	"	.....	1000	"
"	1500	"	.....	608	"
"	2000	"	.....	465	"
"	2500	"	.....	367	"

Action and reaction being always equal and in opposite directions, the explosion of the gunpowder acts with equal force upon the ball and upon the cannon from which it is discharged, the former demonstrating this in its range, and the latter by its recoil. This recoil has to be guarded against as much as possible, either by the weight of the gun itself, or by its secure attachment to a ponderous carriage. The momentum of the recoil, being the product of the shot's weight and the velocity, is readily calculated. The common charge of a 24-pounder gun, being one-third the weight of the shot, or eight pounds, the momentum of both shot and gun will be 1600 (the initial velocity) × 24 = 38,400, which, divided by 5600, or the gun's weight in pounds, gives about seven feet as the velocity per second; if the gun is attached to a carriage, the weight of the carriage must be added to that of the gun for a divisor.

The following table exhibits the effects of varying charge and elevation on different kinds of guns. The line of sight of a gun is an imaginary line drawn through the back-sight on the breech and the fore-sight, a notch in the muzzle ring, or on the first re-inforce. The fore-sight is immovable, but the back-sight is so constructed that the notch shall be at a greater or less height above the axis of the gun. When

Digitized by Google

the line is parallel to the axis and horizontal, the discharge is "point-blank;" but when the back-sight is raised, the direction of the axis of the gun will be to a point more elevated than that to which the line of sight is directed, where the original impulse received by the shot is upwards. Consequently, by raising the back-sight, a greater elevation, and, ordinarily, a greater range, is given to the piece. In regard to point-blank discharge, Tartaglia established the fundamental proposition that the time occupied by the ball in describing the whole trajectory or path is the same as it would require to fall by gravity from the muzzle to the ground.

Nature.	Elevation.	Charge.	Range in Yards.

As regards penetration, it was found by experiments against a martello tower at Eastbourne, with a range of 1832 yards, that solid shot from the 40-pounder Armstrong penetrated into good masonry from 47 to 65 inches, and from an 80-pounder Armstrong 51 to 90 inches. For other particulars relative to the art of gunnery, the reader is referred to LOADING, PROJECTILES, WINDAGE, &c. The important point of the rotation of a ball or bolt will be considered under RIFLED FIREARMS.

GUNNY BAGS, are bags made of a coarse kind of cloth or sacking, manufactured in India, and chiefly in Bengal, from which they are largely exported to other parts of the world. The fibre of which the cloth is made is chiefly that of the same species of *Corchorus*, which yield the jute (q. v.) of commerce. The cotton of America is mostly packed in gunny bags, of which the number exported to America from Bengal has increased from thousands in the year 1796 to millions in 1874. Great quantities are also exported to China, Australia, and other countries. They are partly made up into bags in Bengal, partly exported as Gunny *cluts* or *chuttees*, pieces of size suitable for being immediately made into bags. The manu-

Digitized by Google

facture of these is the great domestic industry of all the populous eastern districts of Lower Bengal. It pervades all classes, and gives occupation to men, women, and children. Boatmen employ themselves in it in their spare moments, husbandmen, palanquin-carriers, and domestic servants, being Hindus, for Mohammedans spin cotton only. It "forms the never-failing resource of that most humble, patient, and despised of created beings, the Hindu widow, saved by law from the pile, but condemned by opinion and custom for the remainder of her days, literally to sack-cloth and ashes, and the lowest domestic drudgery in the very household where once, perhaps, her will was law." (Royle's "Fibrous Plants of India.") Hence the very low prices at which gunny bags are sold. There are few articles of commerce so widely diffused over the globe as the Indian gunny bag.

GUNPOWDER, a well-known explosive mixture composed of sulphur, nitre, and charcoal. Of use in several trades, its principal employment is in the discharge, for war or sport, of projectiles from fire-arms, and in the processes of blasting during mining or quarrying. The history of gunpowder has been already given under FIREARMS (q. v.), and it will therefore be only necessary now to consider the chemical action which takes place when powder is ignited, and then to proceed to a short description of the manufacture.

Extreme care is requisite in securing the purity of the ingredients entering into the composition of gunpowder. The principal impurity of nitre or saltpetre is chloride of sodium, or common salt, which, in consequence of its tendency to absorb moisture from the atmosphere, would have a very injurious action on gunpowder by weakening its power. The details of the process of purification of the nitre would be out of place in this article. The sulphur may be purified either by fusion (when the heavier impurities sink, and the lighter ones may be removed by skimming) or by distillation. The preparation of the charcoal is a most important point. It should be light and porous, should yield a very small amount of ash, especially of carbonate of potash and other deliquescent salts, and should contain little moisture. The woods yielding the best charcoal for gunpowder are black alder, poplar, spindle-tree, willow, and dogwood, the last named giving off the largest volume of gas when ignited with a given weight of nitre, and being on that account especially used for rifle powder.

A vast number of experiments have been made at different times, and by different nations, to discover the proportions of nitre, sulphur, and charcoal best adapted for the production of different kinds of gunpowder; and upon the whole there has been great uniformity in the results, as may be seen from the following table of the percentage composition of the powder of different nations:

Kind of Powder.	Charcoal.	Sulphur.	Nitre.	Authority.
Austrian war powder, . . .	13·1	11·3	75·6	Linck.
English (Waltham Abbey) war powder,	13·7	10·1	76·2	Ure.
Russian war powder, ...	17·7	11·7	70 6	Meyer.
Italian sporting powder, ...	18·2	8·6	73·2	Prechtl.
Chinese gunpowder, ...	23·1	15·4	61·5	Prechtl.

The chemical processes which occur in the ignition of gunpowder are commonly described as follows: When the powder is ignited, the oxygen of the nitre combines with the charcoal or carbon to form carbonic acid, the potassium combines with the sulphur to form sulphide (or sulphuret) of potassium, and the nitrogen is liberated; the reaction being shewn in the equation $KO,NO_5+S+3C=3CO_2+N+KS$. Powder consisting of one equivalent each of nitre and sulphur, and three equivalents of carbon, would contain 74·8 per cent. of nitre, 11·9 per cent. of sulphur, and 13·3 per cent. of carbon or charcoal, which approximates very closely to the Austrian powder in the above table. It is easily shewn that one volume of such powder would yield 296 volumes of mixed carbonic acid and nitrogen gases, after the ordinary reduction for temperature and pressure, although from the intense heat developed at the moment of explosion the actual dilatation amounts to at least 1500 times the volume of the powder employed. The only solid residue, supposing the above equation to represent the true reaction, is sulphide of potassium (KS), and part of this is volatilised by the heat of the explosion, causing a whitish smoke by its combustion, while the part that is not burned gives the peculiar odor to the washings of the gun-barrel.

Digitized by Google

If a larger proportion of charcoal is added, more or less carbonic oxide gas is generated as a product of combustion. Blasting powder is so composed that, theoretically, it should yield on explosion a mixture of carbonic oxide and carbonic acid gases, and leave a residue or bisulphide of potassium; the reaction being expressed by the equation $KO,NO_5 + 2S + 4C = 2CO + 2CO_2 + N + KS_2$. A powder composed according to this formula would contain 64·4 per cent of nitre, 20·4 per cent. of sulphur, and 15·2 per cent. of carbon; and the proportions actually employed are 65, 20, and 15, respectively.

Recent investigations of Bunsen and Schischkoff (Poggendorff's "Annalen," Bd. 102, p. 321) shew that in reality the chemical reactions are very far from being as simple as those given in the preceding paragraphs; the solid residue consisting of various compounds of potassium (sulphate of potash being in greatest quantity), with portions of nitre and carbon.

The ignition of gunpowder must be distinguished from its combustion. The powder is ignited when a portion of it begins to develop light and heat; this in granulated gunpowder communicates from grain to grain with the utmost rapidity; but still, it is important to bear in mind, by successive ignitions. Combustion means the final and total decomposition of each grain separately, and the complete liberation of its component gases. In gunpowder these phenomena follow each other so rapidly, that, unless the mass is spread over a considerable space, they *appear* simultaneous. The heat spread around by each grain during its combustion suffices to ignite all other grains within a sphere of six times its own diameter. This serves to account for the almost instantaneous communication of the flame throughout the whole quantity exposed. The granulation of gunpowder has a great influence on the rapidity of its ignition: the larger the grain, the more rapid is the ignition, but the slower the combustion. On the other hand, small-grained powder ignites more slowly, and burns with greater speed. When mealed or finely powdered gunpowder is employed, it readily inflames, from the presence of the ordinary ingredients; but there being no interstices, the conflagration spreads but slowly, and therefore the decomposition is proportionately retarded. It thus happens that mealed powder exhibits less explosive power and less rapidity of combustion the closer it is pressed together, a circumstance taken into account in the manufacture of fireworks.

In rifled guns and muskets, where it is desired that the projectile should expand to the shape of the grooves, it is obviously best to have a powder which, by very rapid ignition, creates the utmost sudden expansion, and which, by continued combustion, maintains an increasing degree of heat, which shall further augment the explosive force of the gases evolved up to the period of time at which the projectile is driven from the muzzle of the weapon. With this object, large-grained powder is clearly the most suitable, although a contrary view has been long accepted; and that to so great an extent, that some among the recent inventors of rifled arms have had to complain that the only gunpowder they could obtain has been far *too good* for their purposes.

Process of Manufacture.—The three ingredients being taken to separate mills, are reduced by successive grindings to impalpable powder. The several materials are then taken to the *mixing-house*, where they are weighed out into their respective proportions. The charcoal is spread in a trough, and the sulphur and nitre being sifted upon it, the whole are incorporated, though imperfectly, by the hands. The next process is in the *powder-mill*, where the mixture is ground between millstones, and thoroughly incorporated in a wet state. So dangerous is this part of the manufacture, that makers are forbidden to grind more than 42 lbs. in the same house at one time: all the bearings of the machinery are of copper, lest heat should be generated by the friction. According to the quality intended is the time during which this trituration is continued, from one hour to six being that usually employed, and three hours the period in the government factory. The powder, completely pulverised and caked by the moisture and the pressure, leaves the mill in small lumps, called *mill-cake*. This mill-cake is then spread between copper-plates in layers about 3 inches thick, and is subjected to an immense pressure either by a screw-capstan or by a hydraulic engine.

The next operation is graining, a process to which, as already explained, gunpowder owes its rapidity of ignition, and its consequent explosive power. This is

Digitized by Google

performed by forcing the mill-cake through minute holes in a circular parchment sieve, the sieve being kept by mechanism in rapid revolution. The grains thus formed are, however, of very various sizes; and that the gunpowder should be homogeneous, it is necessary that they should be sorted into the several sizes. This is done by the intervention of a series of sieves of different degrees of fineness.

Since the introduction of the immense modern cannon, it has been found necessary to make powder with very large grain, even larger than hazel nuts, this is called *pebble powder*, and is now in general use.

The last processes are drying, glazing, and freeing from dust. The first is effected by heating the powder to a point sufficient to drive off moisture; the second, by the friction of the grains together in a revolving cylinder; the third, by the centrifugal action caused by the powder being twisted round at great speed in a gauze cylinder, when the dust (formed in the polishing) flies off through the gauze, and the bright grains remain as finished gunpowder.

This is a modern system—a system involving considerable personal risk at every stage; for the fine dust becomes so diffused through the atmosphere in the mills, that the slightest spark would blow the whole into the air in a moment. The early process of manufacture was, however, even more dangerous. What with the stirring, and pounding, and spirit (which our forefathers used instead of water, in the idea that a strong fluid would impart strength to the mixture), it was probably to the impurity alone of the materials that the operators were indebted for not being blown to pieces.

The following are the chief properties of gunpowder. Good powder should be perfectly uniform in texture, and should not present any light specks or glittering points. The grains should be sufficiently hard not to be easily crushed by the fingers, or to soil them, or a piece of paper, by mere contact. If inflamed on white paper, it should blacken it but slightly, should on no account set fire to it, and should leave only a very slight residue. The temperature at which it explodes has been carefully studied by Violette, who obtained the following results:

	Angular Grains.	Pulverised.
1. Blasting powder explodes at	518°	509°
2. War powder explodes at	528°·5	510°·5
3. Sporting powder, fine, explodes at	536°	514° 8
4. Do. extra fine, explodes at	603°	518°

The most combustible of these powders was the one containing the largest amount of sulphur, which is the ingredient most ready to enter into ignition. When gunpowder is exposed to a heat of 500°, the whole of its moisture is expelled, and the nitre and sulphur are reduced to the fluid form. On cooling, such powder is found to be intensely black, and the grain has become indurated, and is no longer able to imbibe moisture. Powder is inflamed by any burning substance, by red-hot metal, by the electric spark, or by the violent concussion even of comparatively soft bodies, if it be sufficiently powerful. For example, powder placed upon lead, or even on wood, may be ignited by the shock of a leaden bullet fired at it. Its specific gravity is about 1·8.

The nature of the residue which is left after the ignition of the powder has been already explained. The *fouling* caused by this residue is avoided to some extent by the lubrication of the barrel with a little fatty matter.

The manufacture of gunpowder is carried on to a great extent in Great Britain; the exports in 1875 were 15,071,979 lbs., shipped principally to the colonies, and to Western Africa and South America.

GUNPOWDER, Laws Relating to. In order to guard against the frightful consequences to the public likely to arise from carelessness in the preparation, preservation, or conveyance of this most dangerous article, the legislature in 1875 made stringent rules upon the subject. By 38 and 39 Vict. c. 17—an act which applies also to Scotland and Ireland—it is provided that no gunpowder shall be manufactured except at a factory lawfully existing or licensed under the act, and it shall not be kept except in the factory where it is made, or in a magazine or store duly licensed, or in registered premises. The license is obtained from the local authority (usually

Digitized by Google

justices), and approved by the Home Secretary. General rules are imposed for regulating factories and magazines. There must be a lightning-conductor. No charcoal or oiled rags must be taken into the building except for immediate use. No smoking is allowed. Tools are to be made of wood or soft material. Working-men's clothes are to be without pockets. Carriages and boats for conveying gunpowder must have in their interior no iron or steel exposed. Each building is to have affixed, so as to be easily read, the quantity of gunpowder allowed in each. Retail dealers must be registered, and must keep their powder in a separate house or in a fire-proof safe, not exceeding 200 lbs.; but if kept inside the dwelling-house 50 lbs., or if in a safe inside, 100 lbs. The building or safe is to have no exposed iron or steel in the interior. A breach of precautions against fire or explosion is visited with heavy penalties. The local authorities must keep registers of licensed persons, and all ratepayers can demand a copy thereof. Retail dealers, if using less than 5 lbs. for cartridges at a time are exempted from taking out a factory license. No powder must be sold to a child under 13. All powder exceeding 1 lb. weight must be sold in a canister or case securely fitted, and with the word "gunpowder" visible. Also, powder must be closely and securely packed and labelled for conveyance, if exceeding 5 lbs., and the amount carried is not to exceed 100 lbs. All railway and canal companies are to make rules and have special times and places for loading and unloading powder. Firework factories, if making and keeping less than 500 lbs. of fireworks, need only a license from the local authority; but exceeding that quantity, one from the Home Secretary. To let off a firework in a street or highway subjects the offender to £5 penalty. A government inspector may at any hour of day or night enter and inspect any factory, magazine, or registered premises, and may require the occupier, under a heavy penalty, to make alterations, or take certain precautions. Search-warrants are also readily granted, and in urgent cases are dispensed with.

GUNPOWDER FACTORY, Royal, at Waltham Abbey, an establishment in which much of the gunpowder required for the British army and navy is made. It is built on all the newest and most approved principles to insure safety, economy, and efficiency; but even here accidents occasionally happen in this dangerous manufacture, and roofs and sides, purposely left loose so as to offer but little resistance, are scattered to the winds. Between the different mills mud-banks are raised, and groves of trees thickly planted, to lessen the concussion, and, as far as possible, limit the catastrophe when one house is unfortunately exploded. A series of raised canals, at the same time, is ready to flood the whole place, or to afford a precarious shelter to the men employed, if time be available to make use of it. The charge for this factory for 1878–1879 was £104,439, of which £20,692 were for management and wages, £19,696 for buildings, and £44,764 for raw material. There are about 200 workmen. When the gunpowder is made, it is sent down the Lea navigation, to the magazines at Woolwich and Purfleet.

GUNPOWDER PLOT, The, was a fanatical project on the part of a few Roman Catholics to destroy the King, Lords, and Commons on the meeting of parliament on the 5th November 1605. James I. had succeeded Elizabeth two years before, and his government had exercised great severities against the Roman Catholics, not merely denying them religious toleration, but confiscating their property. A few ruined and exasperated men banded together to overthrow the government. The originator of the plot was Robert Catesby, a man of fortune, which he had impaired by youthful extravagance, and who communicated his idea to Thomas Winter, who was horrified at first, but after a time began to approve and further it. For this end he enlisted into the conspiracy Guy Fawkes, a soldier of fortune, of considerable military experience, and the most determined and fearless character. Catesby enlisted other two, by name Wright and Percy—the latter a relation of the Earl of Northumberland. They hired a house and garden contiguous to the parliament house, and commenced their mine, part working when the others slept, and the rubbish being buried during night. One day when they were alarmed by a noise after they had with much labor pierced the wall three yards thick. Fawkes learned that this noise proceeded from a cellar under the House of Lords, which would soon be vacant. He hired it, and barrels of gunpowder were placed in it, and stones and billets of wood placed over them, for the double purpose of concealment and to

Digitized by Google

act as destructive missiles when the gunpowder was fired. In the interval, a brother of Wright and a brother of Winter had been added to the conspirators, so they were now seven. But they wanted money; and to supply it, two others were induced to enter this fanatical copartnery, and these were Sir Everard Digby of Gatehurst, in Buckinghamshire, a young gentleman of large estates; and Francis Tresham, a follower of Essex, like Catesby and Percy, but, unlike them, a selfish unenthusiastic man—not a man at all suitable for conspiracy, except that he had two thousand pounds to contribute. Their plan was finally arranged for the reassembling of parliament, which was to take place on the 5th November. Guy Fawkes was to fire the mine (if the gunpowder in the cellar may be so called), and then flee to Flanders by a ship provided with Tresham's money, and waiting ready on the Thames. All the Roman Catholic peers and others whom it was expedient to preserve, were to be prevented from going to the parliament house by some pretended message or other, on the morning of the day. After all was ready, Lord Mounteagle was at supper at his country house at Hoxton, where he very seldom was. As he sat, a page handed him a letter received from a stranger, advising him "to devise some excuse to shift off your attendance at this parliament, for God and man hath concurred to punish the wickedness of this time." That this letter was written by or for Tresham, who was Lord Mounteagle's brother-in-law, there can be little doubt. That he desired to save him was certainly one reason for writing it; that he desired to save the conspirators, or at least to allow them to escape, is very probable; and that they might have escaped but for the fanatical hopes of Catesby, is all but certain. It is also probable that Lord Mounteagle had been fully informed of the whole matter by Tresham, and that the supper in the country and the letter were mere devices to conceal Tresham's treachery. When the letter was formally communicated to the king, he at once declared its meaning, and the most simple way of accounting for his power of divination is to suppose that, like Lord Mounteagle, he had been told beforehand. On the very evening of the 4th, the Lord Chamberlain and Lord Mounteagle visited the parliament house, and entering the cellar in a casual way, told Guy Fawkes, whom they found there, and who passed as Percy's servant, that his master had laid in plenty of fuel. Only fanaticism gone the length of fatuity could have made him persevere after this. But he did, though escape was still possible; and on the morning of the 5th, a little after midnight, he was arrested coming out of the cellar, dressed as for a journey. Three matches were found on him, a dark-lantern burning in a corner within, and a hogshead and thirty-six barrels of gunpowder. He was examined and tortured. He confessed his own guilt, but would not discover his associates. However, he and the chief of them were either killed on being captured, or died on the scaffold; except Tresham, who at first walked about openly, but at last was apprehended, and died of a natural disease in the Tower. The memory of this plot, invested by much fiction, has survived in England; and it was not more diabolical than hopeless and mad. It was in itself mysterious, and for purposes of state policy and Protestant zeal, a further mystery was thrown over it. No name in English history has been more detested than that of Guy Fawkes (q. v.).

GUNROOM, in British line-of-battle ships, is the common cabin of officers below the rank of lieutenant (with the exception of the assistant-surgeon, who sits in the wardroom). In frigates and smaller vessels, the gunroom is the common cabin of the lieutenants, master, surgeon, assistant-surgeon, paymaster, marine officers, chaplain, and chief engineer; the junior officers being in those cases consigned to the cockpit.

GÜNS (Magyar, *Kőszegh*), a small town of Hungary, situated on a river of the same name, about 57 miles south-south-east of Vienna. It is inhabited almost wholly by Germans, who are the descendants of Bavaro-Frankish colonists that settled here in the 9th c., and who speak a dialect differing from any other German dialect. Fruit and wine are largely cultivated. Pop. (1869) 6915. G. made itself forever famous by its noble defence for 28 days against the Turkish army under Solyman in 1532. This defence not only forced the Turks to retire, but afforded time for the Emperor Charles V. to assemble a force strong enough to oppose them.

GUNSHOT WOUNDS may vary in severity from a simple bruise to the tearing away of a whole limb. Single balls produce a cut, bruised or lacerated wound, ac-

Digitized by Google

cording to the amount of their velocity when they strike the body. The effects of small-shot vary with the distance and power of the gun; when close, the charge enters with the pellets so close together as to make one wound like a single ball. Some years ago, it was commonly believed that the "wind of a large shot" could produce serious injuries; this belief may have arisen from the circumstance that when a heavy ball, which has lost some of its force, strikes the body at a particular angle, the skin does not always give way, but the deeper structures, such as the muscles, or large organs, as the liver, may be completely crushed. If the wind of a shot could kill a man, it is not likely that soldiers should have had ears, noses, and lips shot off, and yet have experienced only the symptoms produced by those slight injuries.

When a bullet passes out of the body, there are two openings—that of "entrance," which is generally depressed, round, regular, and smaller than that of "exit." The modern conical ball makes a well-defined oblong wound, but it may shift its direction, so as to strike it longitudinally, and cause a more extensive injury to the skin. When a bullet strikes the shaft of a bone, it cracks or splinters it, and either remains or passes through the cancellated ends. In its course, the ball may carry before it pieces of cloth, coins, or other foreign bodies, which increase the danger of the wound. Many persons who have been shot during the excitement of battle, describe the sensation as resembling the sharp stroke of a cane; but in most instances the wounded man soon begins to tremble, as if in an ague-fit, complains of cold, his face becomes pale, his pulse scarcely perceptible, and he appears as if about to die. This is the condition termed *shock;* and though death sometimes does ensue during this state of prostration, it is not so serious as it appears, and the patient will probably pass out of it in a few hours with the help of stimulants and rest. Although excessive bleeding is not so common after gunshot as other kinds of wounds, it may occur immediately to a fatal extent, if assistance be not afforded. This assistance any one can give: it consists simply in placing the fingers in the wound, and if the vessel can be reached, pressing them upon it, directed to the proper point by the warm gush of blood. Should the wound be too small to admit the finger, a handkerchief may be tied round the limb above the wound, and twisted tightly with a stick. It is well to examine the wound, to ascertain the extent of the injury done, and whether there are splinters of bone or portions of dress lying in it, which should be removed. But neither the examination nor the removal should be attempted if they seem likely to aggravate the injury. The treatment is similar to that of other wounds, and consists in protecting the part during the healing stages, moderating inflammation by cold water dressings or soothing poultices, and hastening the last stages of cure by stimulating lotions. During his illness, the general treatment of the wounded man must depend upon so many different circumstances, that it would be out of place to enter upon them here.

GUNTER, Edmund, an English mathematician, was born in Hertfordshire, in the end of 1580 or the beginning of 1581. He was educated at Westminster School, and afterwards at Christchurch College, Oxford. While at Oxford, he gave his attention principally to the study of mathematics, and in 1606 invented the sector, with the lines known as Gunter's Scale. Subsequently, he took orders, became a preacher, and took the degree of B.D. But the bent of his mind being strongly towards mathematical studies, he obtained the professorship of astronomy in Gresham College on the 6th March 1619. He died 10th December 1626. The principal works of G. are the two following: "Canon Triangulorum" (Lond. 1620), a table of logarithmic sines, &c., to seven places of decimals, being the first table published in accordance with Briggs's system; in this work we find, for the first time, the words "*cosine*," "*cotangent*," &c.; "Of the Sector, Cross-staff, and other Instruments" (1624). We also owe to G. the invention of the surveying-chain (see next article), and the first observation of the variation of the compass.

GUNTER'S CHAIN, Gunter's Scale. *Gunter's Chain*, so named after its inventor, is that commonly used by surveyors in measuring land. It is 66 feet long, and its convenience in practice turns on the fact, that ten square chains make one acre. The chain is divided into 100 links, and thus 100,000 square links make an acre.

The name of *Gunter's Scale* or *Gunter's Lines*, is usually given to three lines to be

Digitized by Google

seen on almost any sector, and marked N, S, T, meaning the lines of logarithmic *numbers*, of logarithmic *sines*, and of logarithmic *tangents*. To understand their construction and use requires a knowledge of logarithms; they are explained in every school-book of practical mathematics. The distances of the divisions marked 1, 2, 3, &c. on the line of log. numbers, represent the logarithms of those numbers —viz., 0, ·301, ·477, &c,—taken from a scale of equal parts. The other lines are constructed on an analogous plan. Calling to mind that multiplication of numbers is effected by the addition of the logarithms, division by their subtraction, involution by their multiplication, and evolution by their division, we are able to perceive with what ease many *rough* problems in areas, heights, cubic contents, and other matters may be performed through the agency of Gunter's Scale.

GUNTU'R, a town in the presidency of Madras, stands about 18 miles to the south of the Kistna or Krishna, and about 30 to the west of the Bay of Bengal, in lat. 61° 20′ n., and long. 80° 30′ e. It contains about 20,000 inhabitants; and though badly built and much overcrowded, it is yet understood to be a healthy place. The district of G. is now merged in the collectorate of Kisthna or Krishna.

GUNWALE, a term used on shipboard, rather vaguely, to designate the upper portion of the side of a ship or boat.

GURGAO'N, a district of the Punjab, in the commissionership of Delhi, stretches in n. lat. from 27° 40′ to 28° 30′, and in e. long. from 76 21′ to 77° 35′, containing 2016 sq. m., and (1868) 696,646 inhabitants. Its chief town, which bears the same name, stands at the height of 817 feet above the sea. Its monthly temperature ranges between 68° F., the average of December, and 104°, the average of May.

GURGES, or Gorges, a charge in Heraldry, meant to represent a whirlpool. It takes up the whole field, and when borne proper, is azure and argent.

GURGI'NA BALSAM, a name of the balsamic liquid, also called WOOD OIL, obtained from the Gurjun Tree (*Dipterocarpus turbinatus*). See DIPTERACEÆ and WOOD OIL.

GURHWA'L, a district in the North-west Provinces, lies between the Dehra-Doon and South-west Tibet, extending in n. lat. from 30° 2′ to 31° 20′, and in e. long. from 77° 55′ to 79° 20′. It contains 5500 sq. m., and (1871) 310,282 inhabitants. Being on the southern slope of the Himalaya, G. is little more than a mass of stupendous mountains, whose elevation above the sea sometimes reaches 23,000 feet. It may be regarded as the cradle of both the Jumna and the Ganges, attracting, in spite of the length and ruggedness of the way, crowds of pilgrims to the peculiarly sacred localities of Jumuotri, Devaprayaga, and Gangotri.

GU'RKFELD, a town of Carniola, Austrian Empire, on the right bank of the Save, 46 miles east-by-south from Laibach, at the base of a mountain-range. It is supposed to occupy the site of the Roman Noviodunum. The district produces much wine. There are thermal springs and baths in the town. It contains a Capuchin monastery. Pop. (1869) 6090.

GU'RNARD (*Trigla*), a genus of acanthopterous marine fishes of the family *Sclerogenidæ*, containing a considerable number of species, some of which are common on the British coasts. The head in the gurnards is angular, and wholly covered with bony plates; the body is elongated, nearly round, and tapering; there are two dorsal fins; the pectoral fins are large; the teeth are small and numerous. Many of the gurnards are distinguished by beauty of color. They are supposed to have received the name G. from the sound which they sometimes emit, particularly when newly taken out of the water, and which has obtained for one or two species the local name *Piper*. A recent observer, M. Dufossé, ascribes the sound to the vibration of muscles connected with the air-bladder, and has assigned to the notes produced by different species of gurnards their particular places in the musical scale. Most of the gurnards live generally near the bottom, and are caught either by the trawl-net or by hook and line, a shining piece of a sand-eel being a very captivating bait. Although not among the finest of fishes, they are good for the table. One of the most common British species is the RED G. (*T. cuculus* or *T. pini*); seldom more than 15 or 16 inches long; of a rose-red color, the body marked on the upper

Digitized by Google

part with fine transverse lateral ridges; another, larger and more valuable, being sometimes two feet long, is the SAPPHIRINE G. (*T. Hirundo*), remarkable for the large size of its pectorals and the blue of their inner surface; and perhaps the most common of all is the GRAY G. (*T. Gurnardus*), generally of a gray color, more or less clouded or spotted with brown, black, and yellowish-white. There are several other British species; those of the Mediterranean are more numerous. Gurnards are found also in the seas of the southern hemisphere.

GURMUKTESWA'R, a town of British India, in the district of Meerut, on the route from the town of Meerut to Moradabad, and 31 miles south-east of the former. It is situated on the right bank of the Ganges, about 4 miles below the reunion of the Burha Ganga, or old course of the Ganges, with the present main channel, which, a mile and a half above the town, is crossed by a much-frequented ferry, on which 15 boats constantly ply. G. may be regarded as the port of Meerut and the adjoining district of the Doab. Pop. (1871) 7962.

GURNEY, Joseph John, a philanthropic Quaker, born at Earlham Hall, near Norwich, August 2, 1788, was educated privately at Oxford, and in 1818 became a minister of the Society of Friends. His life was devoted to the prosecution of benevolent enterprises. He died January 4, 1847. G. wrote a great number of works; among others—"Notes on Prison Discipline" (Lond. 1819); "Observations on the Religious Peculiarities of the Society of Friends" (1824); "A Winter in the West Indies described in Familiar Letters to Henry Clay of Kentucky" (1840).

GUSSET, a piece at first of chain, and afterwards of plate armor, intended as a protection to the vulnerable point where the defences of the arm and breast left a gap.—In Heraldry, the gusset is enumerated as one of the abatements or marks of disgrace for unknightly conduct. It is represented by a straight line extending diagonally from the dexter or sinister chief point one-third across the shield, and then descending perpendicularly to the base. Heralds tell us that a gusset dexter indicated adultery; a gusset sinister, drunkenness; and when both were borne it was because the bearer was faulty in both respects. Cowardice was indicated by an abatement called the gore sinister (see GORE), which, though somewhat similar, we are told carefully to distinguish from the gusset, and which consists of two arched lines drawn, one from the sinister chief, the other from the middle base of the escutcheon, meeting in the fess point. A gore like a gusset represents a detached part of a garment; and according to Guillim, gores and gussets "are things in use among women, especially semsters, and therefore are fit notes of cowards and womanish dispositions."

GUSTA'VIA, the chief town of the small Swedish island of St Bartholomew, in the West Indies, stands on its south-west coast, has a good harbor, and has a population of about 1000.

GUSTAVUS I., king of Sweden—known in history as GUSTAVUS VASA, but designated before his accession to power, by himself and others, GUSTAVUS ERICSSON—was born at Lindholm, in Sweden, on the 12th of May 1496, and died in 1560. As the descendant of an ancient Swedish family, which had given members to the national diet for nearly two hundred years, and which had been distinguished for hatred of and opposition to Danish supremacy, G. was involved at an early age in the unfortunate quarrels and domestic wars which distracted Sweden at that period, and the first achievement of the future king was to take an active part in the defence made against Christian II. of Denmark, who, in 1517, in person commanded an assault upon Stockholm, the object of which was to compel the Swedish administrator, Svante Sture, and his senate to acknowledge him as king of Sweden. When famine compelled Christian to relinquish the siege, he had recourse to fraud; and having enticed a deputation from the senate, among whom was G., on board his ship, he set sail, and treacherously carried his captives to Denmark, where G. spent a year in confinement in the custody of his maternal relative, Erich Baner, Lord of Kalloe, in Jutland. While under confinement, G. heard such alarming rumors of the expedition which the king was preparing against Sweden, that irritated beyond endurance, he broke his parole, and escaped in the disguise of a pilgrim, or according to others, as a drover, and after encountering numerous dangers, reached Lubeck (September 1519), from which he was with difficulty conveyed to Sweden, where he

Digitized by Google

landed, in May 1520, near Calmar, the only place of note, except Stockholm, yet still held out against the Danes. G. with difficulty made his way into the castle of Calmar, which was defended by foreign mercenaries; but as his admonitions to the garrison to shew more zeal in their defence were met by threats of delivering him to the Danes, he left Calmar, and took refuge among his father's peasantry in Smaaland. The Smaalanders had, however, already taken the oaths of allegiance to the envoys who had been sent through the country by Christian II. to ascertain the sentiments of the people, and G. was soon compelled to retreat to Dalecarlia, where he wandered for several months in poverty and disguise with a price set on his head, and finally made his way penniless and almost naked, to the house of his brother-in-law, Joachim Brahe, just as the latter was preparing to obey the summons of Christian II. to attend his coronation. Having failed to dissuade Brahe from attending this ceremony, which took place in November 1520, G. retired to his father's property of Räfsnäs, where he remained till he heard of the massacre known as the Blood-bath, which followed three days after the coronation, and in which, on the plea of their being the enemies of the true church, the greater number of the nobles and leaders of Sweden, including Brahe himself and G.'s father, Eric Johansson, were slaughtered in cold blood. G. next retreated to the less frequented parts of Dalecarlia, where for a time he earned his living as a field-laborer, and more than once owed his life and safety to the generosity of the peasant women of the district. This period of his life has been so long made the subject of traditionary lore and romance, that it is difficult now to separate the true from the false; but the fame of his supposed adventures still lives in the minds of the people of Sweden, who cherish as sacred every spot associated with his wanderings and dangers. His appeals to the Dalecarlians met with no success until his account of the tyranny of the Danes was corroborated by the testimony of several fugitives from Stockholm, when a reaction followed, the national enthusiasm was roused, and the men of Dalecarlia, having called together a diet at Mora, proclaimed him head of their own and other communes of Sweden.

This was the turning-point in his life, for the peasantry now flocked around him from every side; and before another year had passed, many of the strongest posts of the enemy had fallen into his hands, and he was able to enter upon the siege of Stockholm, which terminated in 1523, when Christian II. was compelled by his enraged subjects to resign the crown, and retire from Denmark. His forcible abdication brought the Scandinavian union to a sudden close, after it had existed for a period of 136 years; for when Frederick I., the successor of Christian, demanded his recognition in Sweden, conformably to the Union of Calmar, the Swedes declared at the diet of Strengnaes that they would have no other king but Gustavus Ericsson. But although G. was at once recognised as king, he was not crowned till two years later, in consequence of his unwillingness to receive the crown from the hands of the Romish bishops. The king early shewed his determination to favor the Lutheran doctrines, and to cripple the power of the Romish clergy, on whom he laid a large proportion of the heavy imposts raised to meet the expenses of the war; and although his opinions were for a long time not favorably received by the people, he finally succeeded in establishing the Reformation in Sweden.

The disaffection of the peasantry, who threatened to destroy the nobility, and the imprudence of the Lutheran clergy, who tried to force the people to adopt the reformed doctrines, combined to thwart many of G.'s schemes for the improvement of the country, while his latter years were disturbed and imbittered by the jealousy and dissensions of his sons, Eric and John. Yet, notwithstanding these sources of disquietude, G. effected more than any other Swedish monarch has ever done for the welfare of the people. He had found Sweden a wilderness, devoid of all cultivation, and a prey to the turbulence of the people and the rapacity of the nobles; and after forty years' rule, he left it a peaceful and civilised realm, with a full exchequer, and a well-organised army of 15,000 men, and a good fleet, which were both his creations. He promoted trade at home and abroad. Every profession and trade received his attention and fostering care, and schools and colleges owed their revival, after the decay of the older Roman Catholic institutions, to him. He made commercial treaties with foreign nations, and established fairs for foreign traders. In his reign, roads and bridges were made in every part of the country, and canals begun, one of which has only recently been brought to completion. In his relations with his sub-

Digitized by Google

jects, G. was firm, and sometimes severe, but seldom unjust, except in his dealings towards the Romish clergy, whom he despoiled with something like rapacity of all their lands and funds. He did much, however, to promote the cause of Lutheranism, although he took care that the reformed clergy should be dependent on the crown, and enjoy only very moderate emoluments. To him the various tribes of Lapps were indebted for the diffusion of Christianity among them by Lutheran missionaries; while the Finns owed to him the first works of instruction, Bibles and hymn-books printed in their own language. G. was methodical, just, moral, and abstemious in his mode of life; an able administrator; and, with the exception of a tendency to avarice, possessed few qualities that are unworthy of esteem. He was three times married, and had ten children. The name of Vasa, which has been supposed to be an ancient patronymic in his family, but erroneously, since surnames were not in use among the Swedish nobility until a later date, was adopted by him subsequently to his accession, and is conjectured by the historian Geijer (q. v.) and others to have been probably derived from his arms, which bore originally a black fascine used in storming, and afterwards drawn like a vase, but changed by G. to yellow, from whence it came to be mistaken for a sheaf. By an act of the diet of 1544, at Westerasa, the crown was declared hereditary in the male descendants of G.; in conformity with which, his eldest son Eric (q. v.) succeeded to the throne on his death in 1560.

GUSTAVUS II. (Adolphus) was born at Stockholm, December 9, 1594, and died in 1632 on the field of battle at Lützen. He was the grandson of Gustavus Vasa, by his youngest son, Charles IX., at whose death, in 1611, he succeeded to the throne of Sweden. G. had been strictly brought up in the Lutheran faith, and carefully trained in habits of business, and was one of the most accomplished princes of his age. He was acquainted with eight languages, five of which he spoke and wrote fluently, was well read in the classics and ancient history, a proficient in music, and excelled in all warlike and manly exercises. At his accession to power, he found the country involved in wars abroad, and disorders at home, arising from the disputed succession of his father, who had been elected king on the exclusion of his nephew, Sigismund, King of Poland, the direct heir, whose profession of the Roman Catholic religion made him obnoxious to the Swedish people, and virtually annulled his claims to the crown. The first act of G. was to secure the hearty co-operation of the nobles, whose privileges he confirmed, and made dependent upon the performance of military service to the crown, and thus laid the foundation of an essentially feudal or military form of government, in which the nobles held their lands directly, and the peasantry indirectly, under the crown. In addition to these two bodies, which had formerly constituted the national diet, G. for the first time admitted special delegates of the army into the assembly as assessors to the nobles. Having thus organised the internal government, and succeeded in levying heavy imposts and raising some companies of efficient troops, he inaugurated his military career by a war with Denmark, which at that time occupied the Baltic districts of the Swedish territories, and thus completely cut off the Swedes from direct communication with the continent of Eastern Europe. The war continued for a year, and terminated in a peace between the two countries, by which G. renounced his claims on the Lappish districts and other disputed territory, and recovered possession, under certain conditions, of Calmar, Oeland, Elfsborg, and the province of Gottenborg.

Having thus gained an outlet on the Baltic, secured a peaceful ally in the king of Denmark, and concluded an alliance with the Netherlands, G. turned his attention to the Russian war, which, after fluctuating success, was concluded in 1617, by the treaty of Stolbova, by which Sweden obtained supreme dominion over Ingermanland and Karelia, and part of Livland, while Russia recovered Novogorod, and all other conquests made by the Swedes. The boundary of the Swedish territory, which then included the site of the future St Petersburg, was marked, after the peace, by a stone which bore the three crowns of Sweden above a Latin inscription, recording that it marked the limits of the dominions of G. A., king of Sweden. The disputes with Poland still, however, remained undecided; and in 1621, war was openly declared between the two countries, and was continued, with occasional intermissions, till 1629, when it terminated in a six years' truce, which was settled

Digitized by Google

by a treaty that secured reciprocity of trade and freedom of religion to the natives of both countries, and left G. master of Elbing, Braunsberg, Pillau, and Memel.

This peace enabled the king to mature the plans he had long cherished in regard to Germany; and having made various administrative reforms and availed himself of the short interval of peace to promote the material prosperity of the country, he remitted the charge of the government and the care of his infant daughter Christina to his chancellor Oxenstiern, and set sail, in the summer of 1630, with an army of about 15,000 men, to aid the Protestants of Germany in their hard struggle against the Catholic League, which was backed by the power of the empire.

Everything favored the success of the Swedes, who drove the imperialists from Pomerania, and took Stettin. The childless Duke of Pomerania engaged, in return for Swedish aid, that the dukedom should, after his death, be given up to Sweden until the expenses of the war were fully repaid; whilst France, through hatred of the empire, agreed to furnish G. with a subsidy of 400,000 rix-dollars as long as he maintained an army of 36,000 men. Wallenstein had also retired from the service of the emperor. But while the Swedes were besieging Spandau and Küstrin, the city of Magdeburg, which had applied to G. for assistance, was taken in 1631 by the imperial general, Tilly, whose troops perpetrated the most terrible atrocities against the unfortunate inhabitants. Although G. could not save Magdeburg, he soon after its fall inflicted a defeat on the imperialists at Breitenfeld, which excited the respect and fear of the Catholics, who thenceforward ceased to despise the "snow-king and his body-guard," as they designated G. and his small army. The king now advanced into Franconia, and after allowing his army to recruit their strength in the rich bishoprics of Würzburg and Bamberg, took the Palatinate and Mainz, where he held a splendid court, surrounded by numerous princes and ambassadors. In the spring of 1632, the Swedes, in the face of Tilly's army, crossed the Danube, and gained a decisive victory at Ingolstadt, where Tilly was mortally wounded. From thence the march to Munich was one continued triumph, and wherever G. appeared he was received by the populace as their guardian angel. The road to Vienna was now open to him, and the fate of the emperor would have been sealed, had the latter not recalled his general, Wallenstein, who, having accepted office on his own terms, gathered together a large army, with which he advanced on Nürnberg; but after standing a desperate assault of the Swedes, he was obliged to retire into Thuringia. The unfavorable season and the bad roads hindered G. from attacking the imperialists at the time he intended, but on November 6, 1632, the two armies came finally face to face at Lützen. As usual, the Swedes began by singing Luther's hymn, "Eine feste Burg ist unser Gott," and a hymn composed by the king. G. now made an address to the army, and, swinging his sword above his head, he gave the word of command, and with the cry of "Onwards!" he rushed forward, followed by the eager troops, who were commanded conjointly by himself and Bernhard of Saxe-Weimar. Victory was already on the side of the Swedes, when a strong reinforcement of imperialists appeared under the command of Pappenheim. G., seeing that his troops wavered under this fresh attack, rode hastily forward, when, having come too near a squadron of Croats, he received a shot in his arm, and, as he was turning aside, another in the back, which caused him to fall from his horse. The sight of the riderless animal caused dismay and fury among the Swedes; but before they could advance to his rescue, a party of Croats had thrown themselves between the king and his army; and it was not till after many hours' hard fighting, and when the field was strewn with 10,000 dead and wounded, that they recovered the body of the king, which had been plundered, stripped, and covered with wounds. The artillery of the enemy fell into the hands of the Swedes, who remained masters of the field, after having fought with an impetuosity that nothing could resist. A rumor long prevailed that the shot in the back which caused the king to fall was from the hand of Albert, Duke of Saxe-Lauenburg, but it appears that there was no just ground for the suspicion.

Although G. was eminently a warlike king, he made many salutary changes in the internal administration of his country, and devoted his short intervals of peace to the promotion of commerce and manufactures. He was pre-eminently religious, and his success in battle is perhaps to be ascribed not only to a better mode of warfare, and the stricter discipline which he enforced, but also still more to the moral

Digitized by Google

influence which his deep-seated piety and his personal character inspired among his soldiers. The spot where he fell on the field of Lützen was long marked by the *Schwedenstein*, or Swede's Stone, erected by his servant, Jacob Erichsson, on the night after the battle. Its place has now been taken by a noble monument erected to his memory by the German people on the occasion of the second centenary of the battle held in 1832.

GUSTAVUS III., king of Sweden, was born at Stockholm in 1746, and succeeded his father, Adolphus Frederick, in 1771, at a period when the country was distracted by the intrigues of the rival political parties of Horn and Gyllenborg, known as the "Hats" and "caps." Finding that the people, who were thoroughly wearied with the misrule of the nobles, were ready for any change, G. covertly fomented the general discontent, and having raised a fictitious rebellion, through the agency of his friend and adherent, Captain Hellichius, he collected together a large body of troops, on pretence of restoring order, and having arrested the council in a body, convoked the diet, and laid before it a newly framed constitution, to which the assembly was compelled to subscribe. A revolution was thus effected without the shedding of blood, and by a stroke of the pen G. recovered all the regal powers that had been gradually lost by his immediate predecessors. G. acted with great moderation after this successful *coup d'état*; and he might have long retained the advantages he had gained, if his love of display, and his wish to emulate the king of France in extravagance and magnificence, had not led him into profuse expenditure, which embarrassed the finances; at the same time, the introduction of the manners and usages of Versailles at his own court irritated the national party, while it undoubtedly tended to demoralise the upper classes, and through them the nation generally. In 1788 he engaged in war with Russia, at the moment that the empire was engaged in active hostilities against the Turks, but derived no advantages from the contest. On the breaking out of the French Revolution, he combined with the other monarchs against France, and applied to the diet for funds to assist the Bourbons. His repeated applications having been decisively rejected, the nobles, amongst whom he had many enemies, took advantage of his general unpopularity, and entered into a conspiracy against him, the leaders of which were Ribbing, Horn, and Pechlin. On the 16th March 1792, G. was mortally wounded by their agent, a Captain Ankarström (q. v.), at a masked ball in the opera-house which he had himself built. The pistol had been loaded with broken shot, which rendered the wound especially painful, and the king suffered the most dreadful agony for thirteen days before his death.

G. was a man of varied learning, and the author of several dramatic works and poems of considerable merit. His writings have been published in a collective form both in Swedish and French. In 1788, G. deposited certain papers in the library of Upsala, which excited much interest from the fact that they were not to be opened for fifty years after his death. Their publication, which was confided in 1842 to Gejer, disappointed the general expectation, as they were found to consist of historical notes and letters of little value.

GUSTAVUS IV., the son and successor of Gustavus III., was born November 1, 1778, proclaimed king March 29, 1792, and died in 1837. His uncle, Duke of Sudermania, acted as regent during his minority. The young king, on his accession to power, at once gave evidence of the high estimate at which he held the kingly power, and his first act was to join the third coalition against France, contrary to the wishes of his people. Hatred of Napoleon soon, however, became the guiding influence of his life. The result of his decided line of policy led to the occupation of Swedish Pomerania by French troops under Marshal Brune, who took Stralsund and Riga from the Swedes in 1807, and thus deprived them of the last of their German possessions. The king opened all his ports to English vessels, and thereby involved himself in a war with Russia. The scene of these hostilities was Finland, which the Swedes were obliged to give up to Russia at the close of 1808. Norway became next the scene of war, the Swedes being assisted by an English subsidy of 10,000 men, who, however, speedily returned to England when they found that G. intended to send them to Finland. The unfortunate war with Russia, which had been excited entirely through the folly of the king, gave rise to so much discontent

Digitized by Google

in Sweden, that a conspiracy was set on foot by several officers and nobles, the object of which was to dethrone the unpopular monarch. The conspirators took forcible possession of the palace at Stockholm, and placed him under arrest; and after an ineffectual attempt at escape, he consented to abdicate the throne, 29th March 1809. After wandering for a time from place to place, he finally settled at St Gall, where he died, forgotten and in poverty, in 1837. His uncle, the Duke of Sudermania, after acting as regent of the kingdom, was finally proclaimed king, under the title of Charles XIII., at the diet which met in May 1809. By the consent of the diet, Charles XIV. (Bernadotte) paid over the value of the private estates of the family of Vasa for the benefit of Gustavus and his children; but as the dethroned king refused to receive any of this money directly, or to accept the pension which the Swedish government had settled upon him, he was often in pecuniary difficulties, from which he was clandestinely relieved, by his divorced queen and children, who contrived, without his knowledge to supply his wants.

GÜ'STROW, a town of Mecklenburg-Schwerin, and long the residence of the princes, is situated on the left bank of the Nebel, 27 miles south of Rostock. Among the principal buildings are the gymnasium, the old castle (now the workhouse), the fine Gothic cathedral, and the town-house. The former ramparts have been converted into pleasant gardens. G. carries on distillation and beer-brewing, and has several water-mills. Pop. (1875) 10,923.

GUT MANUFACTURE, an unpleasant though rather important branch of manufacture, the operations of which consist in preparing the membranes of animal intestines for various useful purposes. The French call it *boyauderie*, from *boyau*, intestine, and have placed it under stringent legal regulations, on account of its offensive and pestiferous character, especially when conducted in a populous quarter of a town, as at the Rue de la Boyawderie, in Paris. One branch of gut manufacture has been described under GOLDBEATERS' SKIN. *Cat-gut* as it is called, is made from the intestines of sheep, which are first cleansed and freed from loose fat, then prepared by soaking and partial putrefaction, to loosen the different membranes of which the intestine is composed. These are then separated by scraping, then further soaked in clean water and scraped separately. After this, they are treated with a solution of potash, and drawn by women through a sort of thimble, and sorted for twisting into threads. They are then exposed to fumes of sulphurous acid, given off from burning sulphur, which deodorises them, and prevents subsequent putrefaction. The small intestines are used for cat-gut, the large intestines are simply scraped and salted, for the use of sausage-makers and by confectioners, and for tying over preserve and pickle jars, &c. The coarser kinds of cat-gut are used for pulley and lathe bands, strings for archery-bows, drill-bows, hatters-bows, and other purposes where a strong cord subject to friction is required; the finer kinds are twisted into whip-cord, and are used for fishing tackle and the strings of musical instruments. For the latter purpose a very superior quality is required. The best, called *Roman strings*, are made chiefly at Milan. Our manufacturers have never been able to equal these, and this is attributed by some to the fact, that the Italian sheep are much leaner than ours, and the membranes of lean animals are tougher than those which are highly fattened and rapidly fed up to marketable size.

GUTENBERG, Johannes, or Henne, whose proper name was Gensfleisch, or Gänsfleisch, and who is regarded by the Germans as the inventor of the art of employing movable types in printing, was born near the close of the 14th c. at Mainz. He was sprung from a patrician family, which took the names of Gutenberg and Gensfleisch from two estates in its possession. Of G.'s early life no particulars are known, but it seems probable that he devoted himself at an early age to mechanical arts. In the year 1434, he was living in Strasburg, and there, in 1436, made a contract with Andrew Dryzehn, or Drizehn, and others, by which he bound himself to instruct them in all his "secret and wonderful arts," and to employ these for their common advantage. This undertaking, which comprehended the first steps in the art of printing, was frustrated by the death of Dryzehn, more particularly as George Dryzehn, a brother of the deceased, commenced a lawsuit with G., which was decided against the latter. When and where the first attempts in the art of printing were made cannot with certainty be ascertained, as the works printed by G. bear

Digitized by Google

neither name nor date; this much is, however, certain—namely, that movable wooden types were first employed by him about the year 1488. In 1443, he returned from Strasburg to Mainz, where, in 1449 or 1450, he entered into partnership with Johannes Faust, or Fust, a wealthy goldsmith. Faust furnished the money required to set up a printing-press, in which the Latin Bible was printed for the first time. This partnership was, however, dissolved after the lapse of a few years. Faust had made large advances, which G. was now to refund, but as he possessed neither the power nor the inclination, the matter was brought before a court of justice. The result was that Faust retained the printing concern, which he carried on and brought to perfection, in conjunction with Peter Schöffer of Gernsheim. By the assistance of Conrad Hummer, a councillor of Mainz, G. was again enabled to set up a press, from which, in all probability, proceeded "Hermanni de Saldis Speculum Sacerdotum," printed in quarto without date or name. According to some, four editions of the "Donatus" were likewise printed by G., while others ascribe them to Faust and Schöffer. In 1457, appeared the Latin "Psalterium," or rather a breviary containing psalms, with antiphones, collects, &c., and arranged for choruses for Sundays and holidays. This specimen of the art of printing, remarkable as being the first bearing the name of the printer and the locality, as well as the year and day of its completion, and valued by Dibdin at £10,000, was printed with an elegance which sufficiently proves the rapid progress that had been made in the newly-invented art, and the diligence with which it had been prosecuted. G.'s printing establishment existed till 1465 in Mainz. He died, as is generally believed, 24th February, 1468, in which year the archbishop, Elector of Mainz, appointed him one of his courtiers, and raised him to the rank of a noble, though others place his death at the close of the previous year. The evidence in favor of G.'s being the inventor of printing is considered by his countrymen quite conclusive. They adduce the testimony of Ulrich Zell of Hanau, who first introduced the art into Cologne (1462), and who declares that "this noble art was invented for the first time in Germany, at Mainz, upon the Rhine . . . . by a citizen of Mainz, named John Gutenberg." Similarly speaks Wimpfeling, a learned Alsacian (born at Strasburg, 1451, and partly contemporaneous with Gutenburg). "In the year 1440, under the reign of Frederick III. an almost divine benefit was conferred on mankind by John Gutenberg, who first discovered the art of printing." So, too, Trithemus (born 1462, died 1516). "At this epoch, this memorable art (viz., of printing) was devised and invented by Gutenberg, a citizen of Mainz:" while Johann Schöffer, son of Peter Schöffer (the partner of Faust), in his preface to a German translation of Livy (Mainz, 1505), expressly affirms that "at Mainz originally the admirable art of printing was invented particularly by the ingenious Johann Gutenberg, 1450 A.D," and that it was "subsequently improved and propagated to posterity by the wealth and labors of Johann Fust and Peter Schöffer." That G. may have received the first hints of his invention from the Dutch xylography, is not denied. See COSTER. Ulrich Zell himself admits this; but the invention of typography, and beyond all doubt, of the printing-press, must be ascribed to the German.—Compare Oberlin's "Essai d'Annales de la Vie de Gutenberg" (Strasburg, 1801); Née de la Rochelle's "Eloge Historique de J. Gutenberg" (Par. 1811); Gama's "Essai Historique de Gutenberg" (Par. 1857); and Lamartine's "Gutenberg. l'Inventeur de l'Imprimerie" (Par. 1858).

GUTHRIE, Thomas, D.D., an eminent pulpit orator, philanthropist, and social reformer, was born in 1803 at Brechin, Forfarshire, where his father was a merchant and banker. He went through the curriculum of study prescribed by the Church of Scotland to candidates for the ministry at the university of Edinburgh, and devoted two additional winters to the study of chemistry, natural history, and anatomy. Meanwhile, he was licensed as a preacher by the presbytery of Brechin in 1825. He subsequently spent six months in Paris, studying comparative anatomy, chemistry, and natural philosophy. Returning to Scotland, he for two years conducted, on behalf of his family, the affairs of a bank agency in Brechin. In 1830, he became minister of Arbirlot, in his native county; and in 1837 was appointed one of the ministers of Old Greyfriars parish in Edinburgh. Here his eloquence, combined with devoted labors to reclaim the degraded population of one of the worst districts of the city, soon won for him a high place in public estimation. In 1843, G. joined the Free Church, and for a long series of years continued to minister to

Digitized by Google

a large and influential congregation in Edinburgh. In 1845—1846, he performed a great service to the Free Church, in his advocacy throughout the country of its scheme for providing manses or residences for its ministers. G.'s zeal, however, was not diverted into mere denominational or sectarian channels. He came forward, in 1847, as the advocate of Ragged Schools (q. v.); and to him the rapid extension of the system over the kingdom is very much to be ascribed. He also earnestly exerted himself, in many ways, in opposition to intemperance and other prevailing vices. G. possessed great rhetorical talent; and his style was remarkable for the abundance and variety of the illustrations he used. Few public speakers have ever blended solemnity and deep pathos so intimately with the humorous, his tendency to which has more frequently than anything else been pointed out as his fault. G. always displayed a generous sympathy with all that tends to progress or improvement of any kind. He was moderator of the General Assembly of the Free Church of Scotland in May 1862. G.'s most important published works are—"The Gospel in Ezekiel, a series of Discourses" (A. and C. Black, Edin. 1855); "The Way to Life," a volume of sermons (Edin. 1862); "A Plea for Drunkards and against Drunkenness," a pamphlet (Edin. 1856); "A Plea for Ragged Schools," a pamphlet (Edin. 1847), followed by a second and a third plea, the latter under the title of "Seed-time and Harvest of Ragged Schools" (Edin. 1862); "The City: its Sins and Sorrows" (Edin. 1857). Perhaps his "Pleas" furnish the best published specimens of Dr G.'s eloquence. For some years before his death he acted as editor of the "Sunday Magazine," founded in 1864, in which year he retired from his regular ministrations. He died 24th February 1873. His "Autobiography and Memoir" was published by his sons.

GUTHRIE, William, a political, historical, and miscellaneous writer, was born at Brechin, in Forfarshire, in 1708, and educated at King's College, Aberdeen. At an early period, he removed to London, where he worked hard for forty years as a man of letters. He died March 1770. Among his various works are a "History of England" (3 vols. Loud. 1744—1750); and "A Historical and Geographical Grammar" (1st edition, 1770; 24th edition, 1872); a useful manual of information, which enjoyed immense popularity in its time.

GUTS MUTHS, Joh. Christoph. Friedr., a German instructor of youth, was born at Quedlinburg, in Prussian Saxony, 9th August, 1759, studied at Halle, and subsequently became attached to Salzmann's institution at Schnepfenthal. There he gave himself specially to the elaboration, theoretical and practical, of Gymnastics (q. v.) as a branch of education; and from him it has passed into the curriculum of other German institutions. In 1793, G. published his "Gymnastik für die Jugend," which has become a classic work on the subject, and the basis of all subsequent treatises. Besides several other works on his favorite subject, G. M. holds a distinguished place as a writer on geography. He died in 1839. His centennial anniversary was celebrated August 9, 1859, at Schnepfenthal.

GU'TTA PE'RCHA (pronounced *pertsha*), a substance in many respects similar to caoutchouc, is the dried milky juice of a tree, *Isonandra Gutta*, which is found in the peninsula of Malacca and the Malayan Archipelago. The tree belongs to the natural order *Sapotaceæ*. It is a very large tree, the trunk being sometimes three feet in diameter, although it is of little use as a timber tree, the wood being spongy. The leaves are alternate, on long stalks, obovate-oblong, entire, somewhat leathery, green above, and of a golden color beneath. The flowers are in little tufts in the axils of the leaves, small, each on a distinct stalk; the corolla having a short tube and six elliptical segments; they have twelve stamens and one pistil. The name Gutta Percha is Malayan, *gutta* signifying the concrete juice of a plant, and *percha* being the name of the particular tree from which it is obtained. The present mode of obtaining the gutta percha is a most destructive one. The finest trees are selected and cut down, and the bark stripped off; between the wood and bark, a milky juice is found, which is scraped up into little troughs made of plantain leaves. This is the gutta percha, which, as it hardens, is kneaded into cakes, and exported.

Gutta percha was known in Europe long before its peculiar character and uses were made known. It was from time to time brought home by voyagers, in the form of drinking-bowls, which excited much curiosity on account of the material of which they were made. Some thought it a species of india-rubber, others asserted

Digitized by Google

it to be a kind of wood, which they named *mazer-wood*, from its use in making these drinking-cups. But we are chiefly indebted to Dr William Montgomerie of the *Indian Medical Service*, whose introduction of it in 1843 was rewarded by the gold medal of the Society of Arts. He first noticed that the Malays used it for making handles to their knives, &c.; and it immediately occurred to him that it might be of great use in a variety of ways, especially in making handles for surgical instruments. Since that time, the importation of gutta-percha has increased amazingly; in 1880, it exceeded 16,000 cwts. The years 1864, 1865, 1870, and 1871 were marked by large imports, varying from 25,966 cwts. to 35,636 cwts.; in the years 1872 to 1876, the imports varied from 19,627 cwts. to 54,898 cwts. It has been used for making a vast variety of ornamental and useful articles; but its most important application has been the coating of marine electric telegraph wires. In this application, as in most others, its inherent defect, arising from the readiness with which it becomes oxidised and decomposed, is unfortunately manifesting itself seriously and a substitute having greater stability is anxiously looked for.

Its great value arises from the ease with which it can be worked, and its being so complete a non-conductor of electricity. It softens in warm water, and can be moulded into any form in that state; as when soft it is not sticky, and turns well out of moulds. It will always be of great value as a material in which to take casts, as it can in the soft state be made to take the sharpest forms most faithfully, and as it quickly becomes hard and preserves its shape if not too thin, the range of its utility in this respect is very extensive. Golf balls are made of gutta percha.

It is imported in blocks and lumps of five to ten pounds weight, in various forms, chiefly like large cakes or rounded into gourd-like lumps. It has a very light reddish brown, or almost a flesh color, is full of irregular pores elongated in the direction in which the mass has been kneaded. It has a cork-like appearance when cut, and a peculiar cheese-like odor. Before it can be used, it has to undergo some preparation. This consists in slicing the lumps into thin shavings, which are placed in a *devilling* or tearing machine revolving in a trough of hot water. This reduces the shavings to exceedingly small pieces, which by the agitation of the tearing teeth are washed free from many impurities, especially fragments of the bark of the tree, which if not separated, would interfere with the compactness of its texture, which is one of its most important qualities. The small fragments, when sufficiently cleansed, are kneaded into masses which are rolled several times between heated cylinders, which press out any air or water and render the mass uniform in texture. It is then rolled between heated steel rollers into sheets of various thickness for use, or is formed into rods, pipes for water, or speaking-tubes, and an endless number of other articles.

Gutta percha differs very materially from caoutchouc or India-rubber in being non-elastic, or elastic only in a very small degree. Notwithstanding this very striking character of caoutchouc, the two articles are very often confounded in the public mind, probably from the similarity of their applications. It is most probable that India-rubber will eventually displace gutta percha in some of its most important applications, and especially in the coating of telegraph wires, to which purpose it has been successfully applied in America. There are two or three kinds of gutta percha known in commerce, and it is more than probable these are yielded by different species: that from Singapore is esteemed the best, and is distinguished by the Malay traders as *Gutta Tuban* or *Tuban;* that of Borneo is of less value—this is called *Gutta Percha* by the traders, and has given the general name to all; and another kind goes by the name of *Gutta Girek*. The first two are those generally known in our markets.

Gutta percha is turned by surgeons to various uses, chiefly for splints and covering moist applications to retard evaporation. A splint of gutta percha is made by taking a rigid board of the substance cut to the desired shape, soaking it in hot water, and then bandaging it to the limb. In a few minutes the gutta percha is found hard, and modelled to the shape of the parts. The cloth of gutta percha is sometimes used instead of oiled silk, as it is about half the price; it is, however, apt to tear, does not stand much heat, and is less flexible. Gutta percha being readily soluble in chloroform, such a solution is sometimes used for covering raw surfaces, as when the chloroform evaporates it leaves a pellicle of solid gutta percha. It has also been used for stopping hollow teeth.

GUTTA RO'SEA, a kind of cutaneous eruption on the face, popularly called "brandy blossoms," from its frequent occurrence in dissipated persons advanced in life. It is an affection very difficult of cure, and to be treated chiefly by a careful regimen.

GUTTA SERE'NA, an old name for Amaurosis (q. v.).

GUTTÆ, pendant ornaments attached to the underside of the Mutules (q.v.), and under the triglyphs of the Doric order. They are generally in the form of the frustum of a cone, but are sometimes cylindrical. It is not clear what their origin may have been, whether, as the name indicates, they represent drops of water or icicles. Alberti calls them nails; and it does seem likely that as many other parts of Greek architecture have been shewn to be derived from structural conditions (see ENTABLATURE), so these also should owe their origin to a similar cause. They have most probably been derived from the wooden pins or plugs, which were no doubt much more commonly used than iron nails, and of which it is still common to leave the ends projecting in any large wooden structure, such as the centering of a bridge. Whatever their origin, they were modified by the Greeks into a graceful ornament.

GU'TTÉ, or Gutty, from the Latin *gutta*, a drop, is said in heraldry of a field, or any particular charge on the field, covered with drops. When the drops are red, they are supposed to represent drops of blood, and the bearing is said to be *guttè de sang*. In this case, some great suffering or labor, such as fighting for the recovery of the Holy Land, is indicated. Where they are blue, again, they represent tears, and the bearing is said to be *guttè de larmes*. When white they are called drops of water, and the bearing is described as *guttè de l'eau;* but Nisbet is of opinion that tears are intended in this case also, and that repentence or penitence is signified by both.

GUTTER, an open channel for conveying water from buildings, roads, &c. Gutters are necessary for the preservation of such structures, and have thus been in use in all ages. The Greeks, who constructed their roofs with a simple span, used gutters at the eaves of their buildings, hollowed out of the stone which formed the cornice. These gutters discharged their contents on the ground at intervals through small Gargoyles (q. v.), usually in the shape of lions' heads. The Romans followed this example, and also formed gutters with tiles laid in cement.

In the middle ages, the eaves seem to have left without gutters, until, owing to the castles being frequently built on dry rocky sites, it was found desirable to collect the rain-water and preserve it in cisterns. Stone or wooden eaves, gutters, and pipes were used for this purpose. In ecclesiastical architecture, when the construction became complicated, it was necessary to convey the water from the roofs with great care, so as to prevent damage to the building. It was collected at the eaves of the central roof, and by means of well-projected gargoyles, thrown along channels formed in the crest of the buttresses, and so carried beyond the walls of the building, and thrown off through gargoyles in a number of small streams, which dispersed the water before it reached the ground. This acted well in calm weather, but during storms the water was blown back all over the building, which, in case of its being a porous stone, softened and became liable to decay. This led to the use of lead pipes, which carried the water directly to the ground, and discharged it into open gutters. At first, the pipes were used for conveying the water from the main roof to the roof of the side-chapels, whence it was discharged by gargoyles. Pipes conveying the water to the base of the building were first employed in England, where they seem to have come into use during the 14th century. They were formed with great taste, and had ornamental cups or cisterns at the top to receive the water from the mouth of the gargoyle. They were then, with considerable foresight, made *square* in form, not circular, as they usually now are. The advantage of the former section is, that in case of the water in the pipe being frozen, there is room for the expanding ice to swell out by slightly changing the form of the square.

Pipes for conducting rain-water have the great advantage of saving foot-passengers the annoyance they meet with from the discharge of the water from gargoyles; but the latter have the advantage of being more easily inspected and kept in good

Digitized by Google

order. Whenever a gargoyle is choked, it shews the accident by its awkward spouting; but a lead pipe frequently bursts, and does much damage before the leak is discovered. See SEWAGE.

GUTTI'FERÆ, or Clusia'ceæ, a natural order of exogenous plants, consisting of trees and shrubs, natives of tropical countries, very generally secreting an acrid yellow resinous juice. A few are epiphytes. The leaves are opposite, destitute of stipules, leathery, and entire. In botanical character, this order is allied to *Hypericineæ*. It contains about 150 known species, the greater part of them South American, although all tropical countries produce some. The resinous secretions of some are valuable, particularly of those trees which yield Gamboge (q. v.) and Tacamahaca (q. v.). See also CLUSIA.—A few species afford valuable timber. See CALOPHYLLUM.—The flowers of some are very fragrant; those of *Mesua ferrea* are found in a dried state in every bazaar in India, and are used as a perfume.—The fruit of some is very highly esteemed; the Mangosteen (q. v.) has been described as the finest fruit in the world. The Mammee Apple (q. v.) is another of the most celebrated fruits of this order.

GUTZLAFF, Karl, a missionary, was born at Pyritz, in Pomerania, 8th July 1803. At an early age he was apprenticed to a belt-maker in Settin. Here he composed a poem, in which he expressed his earnest wish to become a missionary to the heathen, and in 1821, presented it to the king of Prussia. The king caused him to be placed in the missionary institution at Berlin. At the expiration of two years, he was removed to the Dutch missionary society at Rotterdam, and in August 1826 was sent to Sumatra. Being detained at Java, he fixed his residence at Batavia, where he devoted himself to the study of Chinese. At the end of two years, having acquired a considerable knowledge of the language, and familiarised himself with the habits of the Chinese residents in Batavia, he determined to give up his connection with the Dutch society, and devote himself to the conversion of the Chinese. He joined Tomlin, the English missionary, and, in the summer of 1828, accompanied him to Siam. They settled at Bankok, the capital, partly for the purpose of preaching the gospel, partly to render themselves thoroughly acquainted with the Siamese language, and to perfect themselves in Chinese. For the sake of his health, he now, by the advice of a Chinese friend, undertook a voyage to China; and from this time, Macao became his principal station, and here he formed an intimate friendship with Robert Morrison. In conjunction with Medhurst and two other friends, G. began a new translation of the Bible into Chinese. With the assistance of Morrison, he founded a society for the diffusion of useful knowledge in China, published a Chinese monthly magazine, and preached at Macao and elsewhere. Compare his "Journal of Three Voyages along the Coast of China in 1831, 1832, and 1833, with Notice of Siam, Corea, and the Loo-choo Islands." After the death of the elder Morrison, G. was appointed chief interpreter to the British supervisional government in China, with a salary of £800. In this capacity, he attempted in May 1835, to penetrate into the interior of the province of Fo-kien, but without success. At the same time, the printing of Christian books in the Chinese language, and even the distribution of Christian writings among the inhabitants of Canton, were prohibited. Thus restricted in his missionary career, G. joined the British during the war with the Chinese, and his thorough acquaintance with the Chinese rendered his services of great value. He likewise contributed to bring about the peace in 1842. Finally, in 1844, he founded a Chinese society, for the purpose of diffusing the gospel, by means of native Christians, in the interior of the country. To promote the objects of the mission, he, in 1849, returned to Europe, and visited England, Germany, and other countries. He returned to China, landing at Hong-kong in January 1851, but died there, 9th August of the same year. G. published various works, in different languages, some of which are extremely valuable; the principal are "Geschichte des Chines. Reichs" (Stuttg. 1847), and "The Life of Taoknang" (Lond. 1851).

GUY, Thomas, founder of Guy's Hospital, Southwark, London, was born at Horseleydown in 1644. He began business as a bookseller with a stock of about £200, dealing extensively in the importation of English Bibles from Holland (those printed at home being executed very badly); and on this being stopped, contracted with the university of Oxford for the privilege of printing Bibles, which he continued to do for many years. His principal gains, however, arose from the not very credit-

Digitized by Google

able practice of purchasing, during Queen Anne's wars, the prize-tickets of seamen at a large discount, and subsequently investing them in South Sea Company stocks, by which means he amassed a fortune of nearly half a million sterling. In 1707, he built and furnished three wards of St Thomas's Hospital. In building and endowing the hospital in Southwark which bears his name, he set apart £238,295,16s. He was also a liberal benefactor to the Stationers' Company, and built and endowed almshouses and a library at Tamworth. Besides making bequests to Christ's Hospital, and various other charities, he left £80,000 to be divided among those who could prove any degree of relationship to him. He was of mean appearance, with a melancholy expression of countenance, and during his whole lifetime had no other reputation than that of an intensely selfish and avaricious man. He died December 27, 1724, aged 80.

GUY'S HOSPITAL, founded by the preceding. Thomas Guy leased from the governors of St Thomas's Hospital, a large piece of ground, for a term of 999 years, at a ground-rent of £30 a year. The space being cleared, the first stone of the building was laid in 1722, and the hospital admitted its first patient in 1725, a few days after the death of its founder. The whole expense was £18,796, 16s., great part of which Guy expended in his lifetime, and he bequeathed £219,499 to endow it. Soon after his death, an act of parliament was obtained, regulating the management of the institution. In 1829 Mr Hunt bequeathed to the hospital £190,000, and additional bequest to the amount of £10,000 have since been received. There was at first room for about 400 patients; now 700 can be accommodated. The yearly average of patients is over 3000; the out-patients relieved may amount to 50,000. The annual income is about £40,000, chiefly from estates in the counties of Essex, Hereford, and Lincoln. The usual number of governors is 60, who are self-elective. Students enter the hospital for study, attending chemical practice, lectures, &c., and paying annual fees. The building consists of two quadrangles, united by a cross structure or arcade, besides two wings extending from the front to the street—west wing built with elegance and uniformity, and whole edifice handsome and regular. A library and valuable museums are attached to the hospital. New wards, with tall towers for ventilation, were built in 1852, and a chemical laboratory in 1872. In the chapel is a fine marble statue of Guy, by Bacon, which cost £1000. Sir Astley Cooper, the eminent surgeon, is buried in the chapel.

GUYON, Richard Debaufre, a general in the Hungarian army during 1848—1849, was born at Walcott, near Bath in England in 1813. After having fought against Dom Miguel in Portugal, G. entered the Austrian service in 1833; and on being attached as aide-de-camp to Baron Splényi, married the daughter of that general in 1838. From that time till the outbreak of the revolution, G. led the life of a country gentleman on his estates near Comorn, but was one among the first to offer his services to the national government, and acted a prominent part in the struggle for independence. During the retreat of Görgei's army, G. carried the mountain-pass of Branyiszko, and by that daring feat of his re-established the communication with the government at Debreczin, as also with the several other Hungarian army corps. When, in April 1849, the garrison of the besieged fortress Comorn was to be apprised of the victorious approach of the national army, G., with a detachment of hussars, cut his way through the enemy's lines, and announced the approaching relief. The bloody affair of Szöreg allowed Dembinski, protected by the self-sacrificing ten battalions of G., to retire to Temesvár, where the last battle of the Hungarians was fought and lost on the 9th of August. G. escaped to Turkey, and entered the service of the sultan, without being obliged to turn Mohammedan. Under the name of Kourshid Pasha, he, as a general of division, was governor of Damascus, and at the beginning of the Crimean war, did much to organise the army of Kars. He died at Constantinople in 1856. Indomitable courage, and an incessant care for the comfort of the troops under his command, were the chief features in G.'s character.

GUYON, Jeanne Bouvier de la Mothe, well known in connection with the Quietist controversy (see QUIETISM), was born at Montargis, in France, 18th April 1648. She had destined herself for the cloister, but at the earnest solicitation of her family married, at the age of 14, M. Guyon, the son of a rich contractor of public works.

Digitized by Google

Being left a widow at 25, and still retaining her early religious leanings, she transferred her three children to the care of guardians, settling on them almost all her property. Being thus entirely withdrawn from secular affairs, she attracted much notice by the high tone of spirituality which her conversation breathed, and was invited by M. d'Arenthon, Bishop of Geneva, to settle in his diocese, where she formed the acquaintance of a Barnabite, Père Lacombe, then in much repute as a director of souls. The mystic doctrines which she learned from this ecclesiastic, and which involved such a degree of self-abnegation as to suppose that the truly Christian soul must become indifferent not only to life and death, but even to its own salvation or perdition, having come to the knowledge of the bishop, he withdrew his protection from Madame Guyon. In consequence she left Geneva, and accompanied by Père Lacombe, went to various cities of Italy and France, and eventually to Paris, where they drew about them a number of followers. The reputed extravagances of Madame G. led to her being shut up by a royal order in the convent of the Visitation, from which, however, she was set free at the instance of Madame de Maintenon, and through this lady obtained entrance into the highest circles of Paris and Versailles. It was now that she formed the acquaintance of Fenelon, who was completely won by her evidently sincere piety, and captivated by the earnestness and lofty spirituality of her views.—He failed to see the evil consequences which they involved; and the confiding zeal with which he defended her not only against the misrepresentations with which she was assailed, but even against the too well founded imputations which her principles had drawn upon her, was the cause of his unhappy rupture with Bossuet. See FENELON. Madame G. having submitted her writings to Bossuet and other members of a royal commission, subscribed 34 articles which were drawn up by them, and promised to abstain from all further speculation on these subjects. But she failed to keep her promise, and not only drew again upon herself the hostility of the court, but also became the object of much scandal on account of her intimacy with Père Lacombe. That the latter imputation was a calumny, it is impossible to doubt; but Madame G. was again put under arrest, and imprisoned first at Vincennes and Vangirard, and ultimately in the Bastile. She was liberated in 1702, and henceforward lived in comparative privacy till her death, which took place at Blois in 1717. She is the author of several works, the chief of which are "Torrents Spirituels Moyen Court de Faire Oraison," and "Le Cantique des Cantiques interpreté selon le sens mystique," together with an Autobiography and Letters, as also some spiritual poetry.

GUZEL-HISSAR. See AIDIN.

GU'ZERAT, a geographical division of India, stretches in n. lat from 20° to 24° 45' and in e. long. from 69° to 74° 20', containing about 42,000 square miles and about 3,000,000 inhabitants. Its most important section, perhaps, is the peninsula of Kattywar, which projects into the Arabian Sea between the Gulf of Cutch on the north-west and the Gulf of Cambay on the south-east. Of the mainland, a considerable portion is shut out from the sea by the British districts of Broach and Surat, so that the peninsula comprises nearly the whole of the coast-line and most of the available harbors. With regard, however, to internal communications, the mainland has the advantage of the peninsula, being traversed, to say nothing of streams inferior magnitude, by the Nerbudda and the Tapti. To the south of the last-mentioned river, G. presents the northern extremity of the Western Ghauts. The products are rice, wheat, barley, sugar, tobacco, castor-oil, maize, opium, cotton, and fruits. Within the limits of G. (also spelled *Gujarat* or *Gujerat*) lie the Guicowar's territory, and the numerous petty states of Kattywar, Mahi Kanta, and Rewa Kanta. The name G. often includes also the British administrative division under the governor of Bombay, which comprises the districts of Surat, Broach, Kaira, Punch Mehals, and Ahmedabad.

GWA'LIOR, the capital of the state of the same name in Central India, stands near the north-east extremity of its straggling territory, and has a pop. of about 50,000. Its nucleus is an isolated rock of about 300 feet in height, perpendicular, either naturally or artificially, on all sides; and as it measures 1¼ mile by 300 yards, it can accommodate a garrison of 15,000 men. It is thus virtually impregnable against

Digitized by Google

any native force. The spot is understood to have been occupied as a stronghold for more than a thousand years, and the summit has been provided, from time to time, with several spacious tanks. Along the eastern base of this eminence lies the town of G. containg little worthy of notice but a beautiful mausoleum of white sandstone; and to the south-west there extends for several miles the Lushkar, or camp of the Maharajah's own army, while to the north-east is the Moorar, or cantonment of the protecting contingent. During the troubles of 1857 and 1858, the place attained unenviable notoriety as a centre of rebellion, having, notwithstanding the fidelity of the Maharajah himself, been, for rather more than a year, in the power of the insurgents.

GWALIOR, the state above mentioned, with a remarkably irregular outline, and an area of only 33,119 square miles, stretches in n. lat. from 21° 8′ to 26° 50′, and in e. long. from 74° 45′ to 79° 21′. Lying partly in the basin of the Jumna and partly in the basins of the Nerbudda and the Tapti, it divides its drainage between the Bay of Bengal and the Arabian Sea. It has been roughly estimated to contain about 3¼ millions of inhabitants. Though G. is a Mahratta principality, being, in fact, the principal fragment of the great empire of the Peishwa, yet it is only to the South of the Merbudda that the Mahrattas form any considerable proportion of the people. Under such circumstances, therefore, the dominant race can maintain its supremacy by force alone. Since 1803, the country has been under British protection. The existing relations of the two parties, however, date only from 1844. In 1843, the death of the sovereign, by producing universal anarchy, led to the forcible interposition of the British government; and by the treaty of the following January, in addition to a large contingent under British authority, the native government was permitted to have 9000 troops of its own. During the troubles of 1857, the new Maharajah, not more than 22 years old, remained faithful to the English, notwithstanding the almost entire defection of both divisions of the military force.

GWY'NIAD (*Coregonus Pennanti*), one of the British species of *Coregonus* (q. v.) which, from their form, the large size of their scales, and their silvery appearance, are sometimes called *Freshwater Herring*, and are vulgarly identified with the herring. The general similarity is in this case very great. The G., when full grown, is about ten or twelve inches in length; the first dorsal fin is high; the snout is a little produced; the mouth is small, the jaws without teeth, a few minute teeth on the tongue only. It is found in some of the lakes of Wales and Cumberland. G. is a Welsh name. At Ullswater, the fish is called *Schelly*. It occurs in that lake in great shoals, so that many hundreds are sometimes taken at a single draught of the net. It is rather an insipid fish, and cannot be kept long after being taken out of the water, unless salted, which it often is by the poor. The Freshwater Herring of Loch Lomond is not the G., but the Powan. Many of the species of this genus, however, very nearly resemble each other, and are not easily distinguished by mere description.

GYARMA"T-BALA'SSA, or Balassa-Gyarmat, a town of Hungary, in the county of Neograd, 43 miles north-by-east from Pesth, on the left bank of the Eipel or Ipoly. The surrounding district is very beautiful and fertile, producing much excellent wheat. Near the town are the ruins of a castle, once belonging to the Balassa family, and famous as having been oftener than once heroically defended against the Turks. Pop. (1869) 6435.

GYBING, or Jibing, in sailing with fore-and-aft sails, the act of shifting over the boom, when the wind is astern or at any point abaft the beam, so that the wind may be brought to bear on the sail on the reverse side of the vessel to that in which it was felt previously to the operation. With a change of wind or course, the boom and its sail are *gybed* to the other side of the vessel.

GY'GES, a Lydian, about whose early life little is known. Nyssia, wife of Candaules, king of Lydia, having been grievously affronted by her husband in presence of G., ordered the latter, who was in high favor with his sovereign, either to slay Candaules or to prepare for his own fate. (Compare the history of Rosamund, wife of Alboin, king of the Lombards; Gibbon, vol. v. p. 339, Murray's ed.) G. accordingly put his master to death, married Nyssia, and assumed the supreme power, about 716 B. C. The Lydians, however, refused to acknowledge his authority, until

Digitized by Google

the oracle of Delphi declared in his favor. In return for this service, he made immense presents to the sacred shrine. He is said to have reigned 38 years, and to have amassed enormous wealth, so as to give origin to the proverb "the riches of Gyges." The successors of G. were Ardys, Sadyattes, Alyattes, and Crœsus, who was defeated by Cyrus the Great in 546 B. C. (or 548). The Lydian empire was thus overthrown. Plato has a fable, in which G. is represented as a shepherd of Candaules; but having miraculously obtained possession of a golden ring of great virtue, he was enabled by means of it to make himself invisible when he chose, and thus took occasion to murder his sovereign, and usurp the supreme power. The ring of G. is frequently mentioned in the middle ages.—GYGES is also the name of the hundred-handed giant, son of Cœlus and Terra, who with his brothers made war on the gods, and after his overthrow, was subjected to everlasting punishment in Tartarus.

GYMNA'SIUM. This word (from *gymnos*, naked) was applied to those public places or buildings where the Greek youths exercised themselves. In Athens alone there were seven resorts of this kind. Philosophers also gave instruction in these *gymnasia*, hence the transference of the name to public buildings erected for the mental disciplining and instruction of youth. The German gymnasium corresponds roughly to the grammar and public schools of England, and the grammar and high-schools of Scotland. All three had their origin in the cathedral and monastery schools of the pre-reformation period. The widening circle of human knowledge in the 17th and 18th centuries made itself felt in these educational seminaries as in the universities. Their curriculum became gradually extended, and with the further increase and development of universities, their aims became higher. In Germany, as in this country, the classical tongues formed, and continue to form, the great instrument of mental discipline in schools of this higher class, though other subjects have been added from time to time. The subjects of instruction which were first added to the classical tongues were geography and history. The natural sciences and mathematics, the pursuit of which has formed a characteristic feature of this century, gradually found a place in the schoolroom; and the study of the mother-tongue and of modern languages was also admitted. For a time, these subjects held a co-ordinate place with Latin and Greek. Departmental studies were taught with ardor, and educators were sanguine of the results which would flow from early initiation into the results and processes of the various sciences. These anticipations having been somewhat disappointed, there has for some time been a steady movement towards the restoration of classical or humanistic studies to be the main instrument of education, while retaining other subjects as a subordinate portion of the curriculum. The idea, however, of the gymnasium as specially a preparatory school for the university, and therefore not suited to all classes indiscriminately, has been more steadily kept in view in Germany than in Great Britain, and the consequence has been the breaking up of the middle school or gymnasium into two—the gymnasium proper, where those are taught who propose to enter the universities, or who desire a partial classical training; and real-schools, where elementary science, foreign languages, and mathematics form the principal subjects of instruction. In this respect, the middle-school education of Germany affords a favorable contrast to that of England. It is not to be supposed, however, that in England the grammar and public schools are less efficient in their classical training; the contrary is probably the fact, so far as our principal schools, such as Eton, Harrow, and Rugby, are concerned; but the methodised system of examinations, and the more rigorous methods of Germany, seem to turn out a larger *proportion* of well-instructed boys from each school, while the influence of central authority secures greater uniformity of processes and results throughout the country. The boys attend, as in England, till they reach the age of 18, when, after a special examination (the abiturient or maturity examination), they are transferred to the university. The German gymnasiums differ from English public schools for the middle and higher classes in being day-schools, and not the centre of great boring establishments. In this respect they resemble the Scotch grammar and high schools.

GYMNA'STICS (see GYMNASIUM), a term, in its more restricted and proper sense, applied to those exercises, not amounting in intricacy to games, by which

Digitized by Google

particular limbs, either singly or in combination, are rendered more pliant or stronger; these exercises are arranged in a due progression, and the entire series becomes a system under the name gymnastics. Swimming (q. v.), Boating, and games like Golf (q. v.), Cricket (q. v.), &c., are among the most efficient gymnastic exercises; but in this article attention will be confined to exercises whose primary and direct aim is muscular development and health.

Gymnastic games are so old as to be pre-historic; they are alluded to in the 2d and 23d books of the "Iliad." Before the time of Hippocrates, gymnastic exercises had been adopted in Greece as part of the course of medicine intended to counteract increasing luxury and indolence. The various exercises were speedily combined into a system, and gymnasia, where they should be carried out, were formed first by the Lacedæmonians, and subsequently at Athens. See GYMNASIUM. The Romans adopted the system, and constructed gymnasia on a magnificent scale. Many of their buildings, having had extensive baths attached, were known as *Thermæ*. The exercises in the gymnasia consisted of running, leaping, dancing, wrestling, boxing, hurling, &c.; and in those days, when all men bore arms, and when, in close combat, victory went generally with the strongest man, these games were doubtless of great value. In subsequent ages of knightly prowess, similar exercises were probably practised, though less publicly; but with the introduction of gunpowder, and through its means, the gradual substitution of fighting at a distance—in which science and skill were the main requisites—for personal encounters where strength and muscle went far to carry the day, the attention paid to gymnastics decreased, and finally vanished altogether. To make infantry soldiers perfect in the drilled movements of masses, cavalry good horsemen and fair swordsmen, and to have gunners who could take an accurate aim, became the utmost sought by the possessors of great armies; while the science of gymnastics, having gone out of repute for the military, was speedily neglected in merely civil life. It is only from the earlier portion of the present century that the science has at all revived.

The revival commenced in Prussia, where, about 1806, gymnasia were opened by Basedow and Salzmann, that of the latter being under the superintendence of the celebrated gymnastic pedagogue Guts Muths (q. v.); Jahn followed in the same line, and rendered the science so popular, that it speedily attracted the attention of the youth throughout the kingdom, and to the training thus obtained must be attributed, in no small degree, the vigor which succeeded in driving out the French army of the first empire. Sweden soon imitated Prussia, and from that time gymnastics has formed a prominent feature in the Scandinavian course of education. In Prussia, the gymnasia began to be the scenes of political gatherings too liberal in tendency to please its semi-military government; and in 1818, they were all closed. The troops were, however, continued in gymnastic exercises, and shewed so clearly the advantages of the training they experienced, that, about 1844, Louis Philippe adopted and improved the system in the French army. From that time gymnasia have been constructed for almost all continental armies, and with more or less success, for the civil population. England, last ordinarily in public improvements, only moved in the matter a few years ago by establishing instruction in the science at Aldershot and other camps; in private life, however, there have long been many excellent gymnasia.

Different instructors adopt various systems of instruction. The course passed through in the French army is, however, one amongst the best, as its fruits evince, in the remarkable activity and readiness for emergency displayed by the soldiers who have undergone it. The equipment consists of a broad belt, to be strapped tightly round the waist above the hips, as a support to the body in the arduous motions to ensue, braces being of course discarded. The implements most commonly required are an iron ball in a rope-sling, with a loop for the hand to pass through; wrestling-handles, consisting of two wooden bars, each about 18 inches long, connected by stout cordage; a club; leaping bars, to be leaped over; and leaping-poles wherewith to leap.

The system of instruction is divided into a number of "courses" regularly graduated, beginning with elementary and special movements, with a view to render every part of the body supple, and to develop the several muscles and give complete command over all their motions (*elementary gymnastics*); and proceeding to exer-

Digitized by Google

cises of leaping, suspension, standing and walking on beams, walking on stilts, climbing, swinging, vaulting, &c. (*applied gymnastics*).

The theory of the advantage derivable from gymnastics is simple enough. An admirable law of nature provides that—within certain limits—parts of the human frame increase in strength, aptitude, and size, in proportion to the use made of them. In gymnastics, this law is brought to bear successively on every part, and finally on the whole system in combined action. If the exertion be not carried so far as to induce excessive fatigue, all other parts of the body sympathise with the improving condition of that which is mainly exerted; the circulation, excited from time to time by the exercise, acquires fresh vigor, and blood being driven with unwonted force into all parts of the system, every function is carried on with increased activity; an improvement in the general health becomes soon manifest, and the mind—if simultaneously cultivated with judgment—increases in power and endurance.

Gymnastic exercises require, however, to be practised with many precautions, and always with moderation and due regard to the strength of the individual. The whole benefit may be counteracted by excess; the muscles may be overstrained, and ruptures and other serious accidents ensue. The danger of such evils from gymnastic exercises has perhaps been exaggerated, and it has no doubt hindered their more extensive introduction into schools. But it is to be remembered that hardihood can in no way be obtained without risk; for cricket, fencing, boating, and other manly sports, are attended with at least as much danger as a well-regulated course of gymnastics.

A short account of Gymnastics and Out-of-door Recreations is given in "Chambers' Information for the People," vol. ii. Other works on the subject are—Captain Chinsso's "Gymnastics and Calisthenics;" G. Roland's "Gymnastics;" Walker's "British Manly Exercises;" and MacLaren's "Training, in Theory and Practice;" and "Physical Education, Theoretical and Practical" (1868). The books written in German on Gymnastics (Turnkunst) would form a small library.

GYMNE'MA. See COW PLANT.

GYMNE'TRUS, a genus of acanthopterous fishes of the Ribbon-fish (q. v.) family, having the body much elongated, and at the same time attenuated and compressed, the dorsal fin extending the whole length of the back, the ventral fins consisting only of a single long ray, often dilated at the end; the mouth small. The fishes of this genus are inhabitants of great depths, and are rarely taken or thrown ashore. *G. remiceps* is a native of northern seas; *G. Hawkenii* has occurred on the coast of Britain; other species are tropical. It has been supposed that large fishes of this genus may have given rise to some of the stories of the Great Sea Serpent. One was lately captured at the Bermudas, apparently an immature fish, but more than 16 feet in length, and with a row of long flexile filaments on the back of the head and anterior part of the back, which might well represent the mane often ascribed to the Sea Serpent. A specimen of *G. Hawkenii*, caught on the coast of Northumberland, was exhibited in London at the time when the subject of the Great Sea Serpent excited greatest interest, and was by many supposed to explain the accounts of it.

GYMNO'CLADUS, a genus of trees of the natural order *Leguminosæ*, sub-order *Cæsalpinieæ*.—*G. Canadensis* is a North American tree, found both in Canada and over a great part of the United States, attaining a height of 50—60 feet, with branches remarkable for their upright direction, and an exceedingly rough bark which comes off in slips. The leaves of young trees are very large, three feet long, bipinnate. The flowers are white in short spikes. The pods are five inches long by two broad. The tree is called *Chicot* in Canada, and sometimes *Stump Tree*, from its dead appearance in winter, and the absence of conspicuous buds. It is also called the *Kentucky Coffee Tree*, because the seeds were formerly roasted and ground as coffee in Kentucky. It grows well in Britain. The wood is used both by cabinet-makers and by carpenters. It has very little sap-wood. The pods, preserved like those of the tamarind, are said to be wholesome and slightly aperient.

GY'MNOGENS, in the botanical system of Lindley, are those plants with exogenous stems and perfectly naked seeds. He forms of them a separate class, of which *Coniferæ*, *Taxaceæ*, *Cycadaceæ*, and *Gnetaceæ* are the orders. They are

Digitized by Google

remarkable for the large apparent perforations or discs in the vessels of the wood, but they have concentric zones, spiral vessels, and a central pith, like other exogenous plants. Their great peculiarities, however, are the total absence of a pericarp, and that fertilisation takes place directly through the foramen of the ovule, without the intervention of style or stigma.

GYMNOSO'MATA (Gr. naked-bodied), an order of Pteropodous (q. v.) molluscs, destitute of shell, having a distinct head, and swimming by fins attached to the sides of the neck. They are all marine. The *Clio borealis* of the arctic seas (see CLIO) is the best known and most interesting example.

GYMNO'SOPHISTS (i. e., "naked sages"), the name given by the Greeks to those ancient Hindu philosophers who lived solitarily in the woods, wore little or no clothing, and addicted themselves to mystical contemplation and the practice of the most rigorous asceticism. Strabo divides them into Brahmans and Samans, the former of whom adhered to the strictest principles of *caste*, while the latter admitted any one into their number regarding whose character and kindred they were satisfied.

GYMNO'TUS, a genus of malacopterous fishes, of which only one species is known, the celebrated *G. electricus*, or Electrical Eel. This genus gives its name to a family, *Gymnotidæ*, of which, however, no other known species has any electrical powers. The *Gymnotidæ* are mostly South American, inhabiting the fresh waters of the tropical regions. They are eel-like in form, and like eels are destitute of ventral fins (*apodal*), but they are furnished with complete jaws and with ribs, and their fin-rays are jointed or branched. They have pectoral fins, but no dorsal; the anal fin is largely developed, extending either to the point of the tail, as in the electrical eel, or leaving it free. The electrical eel has the skin entirely soft, and destitute of scales. It is very widely diffused over the warm parts of America and is found both in streams and pools. Its electrical apparatus and powers are described in the article ELECTRICITY, ANIMAL. It is capable of being tamed, and when familiar, will allow itself to be handled without giving a shock, but employs its electrical powers both in order to kill prey and to defend itself from assailants, most frequently, perhaps, alligators. All the *Gymnotidæ* are remarkable for the position of the anus, which is so very far forward as in the electrical eel to be before the gill-openings, whilst in some of the other fishes of this family it is even before the eyes. Some fishes, of this family have an elongated snout. The electrical eel, however, has a rounder and more obtuse nose than the common eel.

GYNE'RIUM. See PAMPAS GRASS.

GYO'MA, a town of Hungary, in the county of Bekes, 89 miles south-east-by-east from Pesth, and on the railway between Pesth and Temeswar. It stands in a plain on the bank of the Körös, which is here crossed by a bridge. There is a Protestant church. Pop. (1869) 9907.

GYÖNGYÖS, a town of Hungary, in the county of Heves, is situated at the southern base of the Matra Mountains, about 50 miles north-east of Pesth. The last declivities of the Matra Mountains produce an excellent red wine called by the Germans Erlauer, and very like Burgundy, for which, indeed, it is often mistaken. G. has a gymnasium, manufactures woollen fabrics, and carries on trade in wine and fruit. Pop. (1869) 15,830.

GYPAE'TOS. See LÄMMERGEIER.

GYPSIES (Egyptians), [Fr. *Bohémiens*; Ger. *Zigeuner*; Dutch, *Heathens*; Dan. and Swed. *Tatara*; Ital. *Zingani*; Span. *Gitanos, Zincali*; Hung. *Czigányok, Pharaonepek*; Pers. *Sisech*; Hindu, *Karachee*; Arab. *Harami*; Gyps. *Rom* (man), *Sinti* (from Ind), *Calo* (black); nicknamed in Fr. *Cagoux, Geux*; Germ. *Zieh-Gauner*, &c.], a mysterious vagabond race, scattered over the whole of Europe and parts of Asia and Africa. Whence they originally came, and what were the motives which drove them from their native soil, are questions which, after having passed through a long stage of helplessly absurd speculation, have of late years been ventilated by competent investigators, both linguists and historians, and are still but partially solved. So much only seems now established, that India, the cradle of many nations, was also the source from which they sprang.

Digitized by Google

Whether, however, they are the Tshandalas of which the laws of Menou speak, or the kinsmen of Bazeegars or Nuts of Calcutta; whether they belong to the Tshingani, a band of robbers near the mouth of the Indus, or are the descendants of those Luris—identical, according to Persian and Arabic authorities, with the Zuts or Djatts of Northern India—whom Firdusi mentions as having been called into Persia by Bahram Gur to the number of 10,000, about 420 A.D. that they might act as musicians to the poor—cannot be affirmed with certainty, although there can be no doubt that theirs must have been at all times one of the poorest and most obscure tribes of India. The first considerable body left Asia for Europe before the 12th c., perhaps in consequence of disastrous encounters with the Arabian conquerors; and Tamerlane was unquestionably the cause of still more numerous emigrations in the 14th century. The first notice of them which occurs in European literature is embodied in a free paraphrase, in German, of the Book of Genesis, written by an Austrian monk about 1128. They are there described as "Ishmaelites* and brasiers who go peddling through the wide world, having neither house nor home, cheating the people with their tricks, and deceiving mankind, but not openly." Two hundred years later, we find them settled in Hungary (under Belus II.), at Cyprus, and in Wallachia. In 1417, they travelled in great hordes into Moldavia and many parts of Germany. In 1418, five months after the Council of Constance, they appeared about 1000 strong, before Zürich, commanded by a Duke Michael "of Little Egypt," accompanied by several dukes and knights, and carrying with them a good supply of money, sporting-dogs, and other "marks of nobility." From Switzerland they descended into Italy, and in 1422 they shewed themselves at Bologna and Forli. Another band, numbering, this time, according to the old Swiss historian, Stumpf, 14,000 arrived in the same year at Basel. On the 17th of August 1427, a band of them, coming from Bohemia, made their appearance before Paris, which, however, they were not allowed to enter, but were lodged at La Chapelle Saint Denis. Other hordes succeeded these in the following years, spreading in rapid succession over all parts of Germany, over Spain, England, Russia, Scandinavia, and, indeed, over the remotest parts of Europe. The account which they most frequently gave of themselves was, that they originally came from "Little Egypt;" that the king of Hungary had compelled about 4000 of them to be baptised, had slain the remainder, and had condemned the baptized to seven years' wandering. Another version of their story was, that the Saracens had gone to war with them in Egypt, had subdued them, and forced them to renounce Christianity; that, after some years they had been reconquered by the Christians, and that the pope, Martin V., had laid upon them, as a penance for their renunciation of the true faith, a life of wandering for the space of seven years, during which they were not to sleep in a bed. At the end of this period, they would be sent to a fine and fertile land. Yet another account was, that they were commanded by God to roam through the world for that period, in expiation of their want of hospitality towards Joseph and Mary—a notion which has, curiously enough, been partly revived in our own day by Roberts, with this difference only, that he proves them, from the prophecies of Isaiah, Jeremiah, and Ezekiel, to be the descendants of the ancient Egyptians, and their wanderings to be the predicted punishment of the various iniquities of their forefathers.

At first they were well received. The romance with which they surrounded themselves, their pretended state of penitence, above all, the pomp and wealth they displayed, were sufficient to secure the good-will of the countries through which they passed—so much so, that letters of safe-conduct were given them by the Emperor Sigismund, the genuineness of which there is no reason to doubt. Soon, however, the tide began to turn. Their resources gone, they were everywhere treated with contumely, and despised chiefly on account of the degrading arts of chiromancy, magic, and thieving, to which they again resorted for their support, like their earlier brethren, described by the monk. And with the reckless brutality characteristic of

*Ishmaelites—a notion perpetuated in the designation "Geschmeilim" of the Danish thieves' jargon, and the German "Rothwälsch" (Dorph, 44 and 45; Grolman, 65)—a term which has hitherto puzzled all investigators, Pott himself not accepted (cf. p. 28; Heister, p. 8), but which is nothing but a corruption of the Hebrew "Jishmaelim"—Ishmaelites.

Digitized by Google

the middle ages, edict after edict was hurled against these "diviners and wicked heathens." The governments of Europe vied with each other in banishing, outlawing, and slaying them whenever and wherever found, and in most severely punishing those that dared to shelter them, chiefly "because of their traffic with the devil." These edicts remained in force in many countries down to the 18th c.; and Frederick the Great, in 1748, renewed the law that every Gypsy beyond the age of 18, found in his states, should be hanged forthwith. In England the most barbarous decrees against them were issued by Henry VIII. in 1531 and Elizabeth in 1563. In Scotland, where, under James V., a certain Johnny Faa had been officially recognised by the crown as Lord and Count of Little Egypt, some of the severest edicts date from 1570, 1603 and 1609; and in 1624, Helen Faa, a descendent of Johnny, together with fifteen other women of the seed-royal, were condemned to be drowned. Towards the latter half of last century, however, more humane measures were adopted towards them, with a view to the improvement of their social and moral state. Maria Theresa, in 1768 and 1773, issued ordinances for the education of their children, and their gradual settlement as cultivators of the soil, chiefly in Hungary and Transylvania, where they swarmed in large numbers; special streets were built for them at the ends of the villages, and the name of Uj-Magyar, Uj-Parasztok (New Peasants), was officially bestowed upon them. Joseph II. renewed these edicts in 1782, with certain modifications. Various other methods of gradually amalgamating them with the general population were tried elsewhere (a society was formed for that purpose at Southampton by the Rev. Mr. Crabb in 1832), but with comparatively little effect. They have continued—with few exceptions—their peculiar nomad life, with all its questionable resources and practices, its joys and its sorrows, unchanged, up to this day; and even gypsy children, brought up far from their tribe, in the midst of Christian families, have, driven by some mysterious and uncontrollable impulse, run away from their civilised homes as soon as a favorable opportunity offered.

Before proceeding to give a general outline of their present condition, we must briefly mention what have been the opinions held about them since the 15th c. by the learned. They have been, then, by turns set down as Egyptians, Nubians, Tartars, Cilicians, Mesopotamians, Assyrians, Ethiopians, Moors, Armenians, Maulchæans, Banditti, and German Jews. More recently, they were, on account of the name of Zingari or Zingani—probably a corruption from their own name Slute (from Ind), by which they are known in many countries of Europe—brought in connection with the Sigynnai, a people of Median origin, settled on the Danube, mentioned by Herodotus; with the Sigynni of Strabo, in the Caucasus; with the Usbecks, and a host of other tribes known and unknown. Again, their name has been derived from one Zinganeus, who, in 1517, when they had long been known as Zingani, fled with his followers to escape the vengeance of Selim. The now recognised theory of their Indian origin, proved incontestably by their language, was first positively advanced by Rüdiger in 1782; and in his track followed, with more or less success—collecting, comparing, or arranging new and old linguistic materials—Grellman, Alter, Seetzen, Pottinger, Hoyland, Puchmayer, Ouseley, Danilowicz, Bischoff, Domeny de Rienzi, Graffunder, Richardson, Bishop Heber, Pott (whose wonderfully exhaustive work on this subject made him the *facile princeps* of gypsologists), and more recently Paspati, Miklosich, Borrow, Leland, Smart, and Crofton. Bataillard wrote on the history of the G. without discussing specially their language.

This their language, then—a daughter of the old Sancrit—has, besides giving the only real clue to their origin, also shed some rays over the dark period between their first emigration and their appearance in Europe. Originally the distinct mode of speech of a single and special border tribe of Northern India, it has, during the many wanderings of the race, appropriated words from every country through which they passed: while, on the other hand, it lost many of its own words, and still more of its own inherent power and elegance, and much also of its resemblance to its mother and sisters. These adopted foreign words, their respective number, and their more or less corrupted state, point plainly to the gypsies having passed first into Persia, to their having remained there for a considerable time, to their having then wended their way to some Greek country, perhaps Asia Minor (the designations for 7, 8 and 9 being still Greek), and to their descent thence into Hungary, Cyprus, &c.

But their language also (Romany Tschib), though split into different dialects, has

Digitized by Google

remained almost the only tie which binds the widely-scattered nomad members together. Those of their branches who for centuries have had no intercourse with each other, would, although the strange elements in the other's speech would be incomprehensible to them, yet recognise each other at once by certain words and formulas indelibly written in the memory of the whole race. The outward appearance of the gypsies, who have been pronounced by competent writers to be one of the handsomest races of humanity, varies in some degree according to the climate under which they are born and in which they roam. Their chief characteristics, however, remain everywhere the same: tawniness of skin; slightly projecting, but agreeably formed cheek-bones; long hair, of the color and lustre of coal; large black eyes, exquisitely shaped mouths, ruddy lips, teeth of a dazzling whiteness, slenderness and agility of limb, expressive features, and well-proportioned, often elegant build. Their women are, indeed, exquisitely beautiful when young, but they lose their good-looks at a very early period, partly on account of the squalor of their habits, and partly from their unsettled and precarious life. Like children, they are fond of showy colors in dress, and do not disdain to adorn themselves with even dubious trinkets and fine garments in a forward state of decay; but they always arrange their clothes, however poor, with great taste. Of their other qualities, their manners and customs, we can only say that they were, and still are, supposed to be cowardly, revengeful, and treacherous; that they allow themselves to be used as spies; are the associates of robbers and thieves; and that their women, chaste themselves, ply all sorts of questionable trades, chiefly selling poisons, and acting as go-betweens. It is further said that their language has no word for God, immortality, soul—that in fact, they have no religion whatever; that their marriages, contracted very early, are not binding; that they were, or are, wont to eat their parents; and that they are altogether a very criminal race. How much of all these charges is more founded on fact than their intercourse with demons, for which they have been so dastardly slaughtered in former days, we are not able to decide; certain it is, however, that their ethical code differs most essentially from that of other people (Gorgio), whom they despise on account of their childish credulity and brutal cruelty. They have proved themselves on several occasions bold and courageous as lions, but they prefer running away to fighting the battles of the foreigner; and it is also agreed on all hands that they are passionately attached to their relations; that they are fatalists, and have a sort of fetichism or pantheism, though its peculiar form has never been revealed by them to any inquisitive tourist. At the same time they belong outwardly to the religion of every country which they happen to inhabit, and repeat the process of baptism as often as they can, with a view, as some have it, to the presents of godfathers and godmothers. They believe in a metempsychosis or transmigration of souls, and refrain for that reason from eating certain animals (eels, &c.), although generally they are anything but choice in their food. They are dirty, lazy, fond of drinking and smoking. Their talent for music is remarkable in the extreme; their ears seize, and their instruments reproduce, after the first hearing, the most difficult and complicated pieces, even entire symphonies. Many famous artists (Keszkemecz, Bunks, &c.) have issued from their ranks, and their own melodies sounding over the wide Hungarian pushtas, the steppes of Russia, or through the streets of Jassy, are not easily forgotten. Some of them have indeed become the much valued property of other nations, or are embodied in some of our favorite operas. No less wonderful is the grace and charm of their wild dances. Altogether the gypsies are one of the most gifted races, the lost genius, so to say, of humanity. The real truth about them, their traditions and religion, will, we fear, be ever kept a secret. The statement of Borrow, who has lived long among them, that their entire catechism is summed up in the three precepts "Be true to your people—be faithful to your husbands—and never pay any debts except those owing to your own kindred," must we fear be received with the same degree of caution which we are sorry to say, has to be applied to many other statements about their manners and customs contained in his otherwise useful "Gypsies in Spain." The incredibly absurd descriptions of the Jewish marriage ceremonies about which we do possess the fullest and most authoritative information, give there as a counterpart to those of the gypsies, shew plainly how easily and abun-

dantly his good-natured credulity must have been worked upon.

The increase of population and wealth, growth of culture all over Europe, are the

Digitized by Google

worst enemies. Their forests are cut down, their heaths enclosed, the houses are pushed right into their commons; and the easy and remunerative belief in their secret arts is waning more and more. It is doubtful, indeed, whether they will, as a separate race, survive many more centuries in Europe. Their numbers at this moment are stated so very differently, that we would fain caution the reader against an implicit belief in the following figures, which we extract from the comparatively most reliable authorities: in Hungary, 140,000; in Transylvania and the Principalities, 162,000; Spain, 40,000; England and Scotland, 18,000 (their chief families in these countries being the *Royal* Lees, the Stanleys, Coopers, Hernes, Smiths, Lovells, &c.); Poland, 2000; Russia, 10,000; Germany, France, and Italy, 40,000; Norway, 1500. Altogether, including those in Turkey and in Asia and Africa (their sojourn in Mexico is questionable), they are computed at about five millions (Rienzi). A small portion only of these occupies as a body fixed habitations in Hungary and Transylvania, where they are agriculturists and goldwashers; and in the Principalities, where they live in a kind of serfdom, and are divided into four different classes—Rudari or Aurari (gold-seekers), Ursari (bear-leaders), Lingurari (manufacturers of and dealers in wooden spoons, mouse-traps, &c.); and Lafessi (masons, smiths, tinkers, &c.). All the rest lead a roaming life, live in kennels and under tents from one end of the year to the other, gaining their scanty livelihood, like their forefathers, as best they can, fearing and detesting nothing so much as a fixed and continuous occupation, which would take them away from "their free mountains, their plains and woods, the sun, the stars, and the winds."

The following is a specimen of their language in the form of a short improvised stanza:

Poraquel luchipen abajo
Abillela un balicboró,
Abillela á goli goli,
Ustilame Caloró.

There runs a swine down yonder hill
As fast as e'er he can,
And as he runs, he crieth still:
"Come steal me, gypsy man."

GYPSUM, a mineral consisting essentially of sulphate of lime and water, the proportions of its constituents being lime, 32·56; sulphuric acid, 46·51; water, 20.93. It is very widely diffused, occurs in great abundance in many parts of the world, and is found in rocks and strata geologically very different, as in transition rocks, in secondary and in tertiary formations. It often occurs in nests or kidney-shaped masses in clay or marl. It is found above chalk in many places, and large quantities of it are quarried in some parts of England from the red marl immediately above the great bed of rock-salt. It sometimes occurs in beds many feet thick. It is transparent or opaque, white, yellowish-white or gray, or even yellow, red, brown, or black, according to its purity of chemical composition or the quantity and nature of impurities present. It is also compact, fibrous, foliated, or earthy; sometimes crystallised in six-sided prisms or in lenses. Twin crystals are frequent. It is easily broken, scratched, and cut. Before the blow-pipe, it becomes opaque, if not already so, and fuses into a white enamel. The water which it contains is driven off by a heat of about 272° F., and it is then easily reduced to powder, in which state it is well known as *Plaster of Paris*. Unburned G. is tough, and not easily reduced to powder. G. is soluble in cold water, to the extent of about one part in 461, and is a frequent ingredient in the water of springs; it is scarcely more soluble in boiling water or in acids. To this solubility in water, although so slight, must be ascribed the value of G. as a manure; the further chemical explanation of which, however, still remains to be ascertained, although theories have been proposed by Sir Humphry Davy and by Liebig, the former supposing the G. to act chiefly by itself, becoming the nutriment of the crops to which it is most beneficially applied; the latter supposing it to act chiefly by fixing the ammonia of the atmosphere and conveying it to their roots. As a manure, G. is more extensively used in some parts of the continent of Europe

Digitized by Google

and of North America than of Britain. In North America, it is reduced to a fine powder by mills, in order to be used as a manure, for much of its value depends on the fineness of trituration. To clover crops, the application of G. is particularly beneficial, and although it does not produce much benefit in its direct application to grain crops, yet in an alternation of wheat and clover, the crop of wheat is larger because of the liberal supply of this mineral manure to the clover. An excess of G., however, is prejudicial, as has been found in some parts of England, where the subsoil containing it in great quantity has been rashly brought up by the plow.—G., deprived of its water by burning, and reduced to powder, forms a paste which almost immediately *sets*, or becomes firm and solid, when mixed with its own bulk of water; hence the great use of *Plaster of Paris* for making casts and cornices. But if the G. is burned at too great a heat, it refuses to set, and the powder of the mineral called *Anhydrite*, which is an anhydrous sulphate of lime, has not the property of setting.—One of the finest varieties of uncrystallised and untransparent G. is Alabaster (q. v.).—*Satin Spar* is a beautiful fibrous variety of G., exhibiting a fine play of light, and employed for necklaces, inlaid-work, and other ornamental purposes, but having the disadvantage of being easily scratched.

GYPSY-WORT (*Lycopus Europæus*), a perennial plant of the natural order *Labiatæ*, with stem about two feet high; opposite, ovato-lanceolate, scarcely stalked, almost pinnatifid, wrinkled leaves; and dense whorls of small whitish flowers with purple dots, the limb of the corolla 4-cleft and nearly equal; only two stamens perfect. It grows in ditches and wet places, in Britain and on the continent of Europe. It is a febrifuge. The juice stains cloth a permanent black color, and gypsies are said to use it to give a dark hue to their skin, whence the English name gypsy-wort, and the French *Herbe des Bohemiens*.

GYRA'TION, Centre of. See CENTRE OF GYRATION.

GYR-FALCON, or Jer-Falcon (*Falco gyr-falco* or *F. Islandicus*), a species of Falcon (q. v.) of large size, the female, which is the largest, being about two feet in entire length; the plumage almost brown when the bird is young, but gradually changing to white as it advances in age, the white margin of each feather encroaching on its brown centre, until aged birds are almost pure white. It is rarely seen in Britain, and very rarely in the southern parts of the island, but inhabits all the very cold northern parts of the world. It was formerly in high esteem for falconry, and was procured at great expense from Iceland and Norway. It is sometimes called ICELAND FALCON, and sometimes GREENLAND FALCON.

GYRI'NUS, a Linnæan genus of coleopterous insects, now constituting a family, *Gyrinidæ*, closely allied to *Dytiscidæ*, or Water Beetles (see DYTISCUS), but differing in having the antennæ very short, the two fore-legs long and stretching forward like arms, the other legs very short and comparatively broad. The eyes are divided by horny processes, so that each of them almost becomes two. The body is oval, as in the *Dytiscidæ*. The *Gyrinidæ* are very generally characterised by metallic brilliancy of color. They are mostly small insects. They fly well, swim and dive well, spend the winter in the mud at the bottom of ponds, and in spring and summer may be seen swimming very actively on the surface of the water, ready to dive on the slightest alarm. In diving, they carry down with them a bright bubble of air. They generally swim in little parties, seeming to chase each other in circles, whence their French name, *Tourniquets*, and their English name, *Whirligigs*. They feed on smaller aquatic animals, which they seize in their gyrations. They deposit their eggs on the leaves of aquatic plants. Their larvæ are aquatic, having their bodies composed of thirteen deeply divided rings, of which three bear the feet, and the rest bear filaments probably serving as organs of respiration. The most common British species is *Gyrinus natator*, a smooth shining blackish insect, three lines long.

GY'ROMANCY (*gyros*, a circle, and *manteia*, prophecy) was a method of divination by means of a circle, and was generally performed in the following manner: the soothsayer described a circle, and marked it all round with letters; then he commenced to walk round the circle, repeating his incantations, and at the places where he stopped the letters were carefully noted, and by the interpretation put upon these letters, the answer of the god was obtained.

GYRO'PHORA. See TRIPE DE ROCHE.

GY'ROSCOPE, an instrument invented by M. Foucault to render palpable to the eye the earth's rotation. Its success depends on the principle, that if a mass be set in rotation freely in space, it will, unless disturbed or constrained, preserve absolutely the plane of its rotation, and will, to effect this, even overcome slight obstacles. In the gyroscope, a heavy ring of metal is almost freely suspended by mechanical contrivances, after having communicated to it a very rapid motion, and to maintain itself in the plane of its rotation, while the earth in revolving on its axis turns round the whole mechanism, it causes a graduated slip to move round under a telescope placed in position, and so renders the earth's motion palpable to the eye. See GYROSCOPE.

GY'ROSCOPE (Greek) is the name given to an instrument for the exhibition of various properties of rotation and the composition of rotations. It differs from a top in having both ends of its axis supported. The invention is probably French or German, and in some of its forms it dates from about the end of last century; but no certain information can be obtained on these points. We will consider only two of its many applications.

First, if a mass be set in rotation about its principal axis of inertia of greatest or least moment, it will continue to revolve about it; and, unless extraneous force be applied, the direction of the axis will remain unchanged. Such, for instance, would be the case with the earth, were it not for the disturbances (see NUTATION and PRECESSION) produced by the sun and moon: the direction of the axis would remain fixed in space (i. e., the pole-star would be always the same star), in spite of the earth's motion in its annual orbit. It is for this very reason that modern artillery is rifled, so that the projectile revolves about its axis. If, then, a mass of metal, as, for instance, a circular disc, loaded at the rim, and revolving in its own plane, be made to rotate rapidly about its axis of greatest moment of inertia, and if it be freely supported (in gimbals, like the box of a compass), the direction of its axis will be the same so long as the rotation lasts. It will therefore constantly point to the same star, and may, of course, be employed to shew that the apparent rotation of the stars about the earth is due to a real rotation of the earth itself in the opposite direction. This application was made by Foucault shortly after his celebrated Pendulum (q. v.) experiment, and he is generally looked upon as the inventor. The "Transactions of the Royal Scottish Society of Arts," however, shew that this application of the gyroscope was made many years before (March 1836), by Mr. E. Sang, C.E. It is, in practice, by no means so perfect a mode of proving the earth's rotation as the Foucault pendulum; but this arises solely from unavoidable defects of workmanship and materials—the mass of the gimbals, and the friction on the pivots. Professor Smyth, the Scottish Astronomer-Royal, has recently applied this property of the gyroscope to the improvement of our means of making astronomical observations at sea. A telescope, mounted on the same support as the ends of the axis of the gyroscope, will, of course, be almost unaltered in position by the rolling or pitching of a vessel; and a steady horizon, for sextant observations of altitude, is procured by attaching a mirror to the support of the gyroscope, and setting it once for all by means of spirit-levels. The mechanical difficulties of construction have not yet been quite got over, but there seems to be little doubt that this application will some day be of very great practical value.

But the most singular phenomena shewn by the gyroscope are those depending on the *composition* of rotations. We have already seen (ROTATION) that any motion whatever of a body which has one point fixed is of the nature of a rotation about an axis passing through that point. Hence, simultaneous rotations about any two or more axes, being a motion of some kind, are equivalent to a rotation about a single axis. The effect, then, of impressing upon the frame in which the axis of the gyroscope is suspended a tendency to rotate about some axis, is to give the whole instrument a rotation about an intermediate axis; and this will coincide more nearly with that of the gyroscope itself, as the rate of its rotation is greater. It is hardly possible to explain to the non-mathematical reader the exact nature of the compound motion, which consists in the rolling of an imaginary cone fixed in the gyroscope upon another fixed in space; but the rotation of the axis of a top round the vertical (when it is not "sleeping" in an upright position), and the precession of the

Digitized by Google

earth's axis, are precisely similar phenomena. Thus when the gyroscope is spinning, its axes being horizontal, a weight attached to the framework at one end of the axis makes the whole rotate about the vertical; attached to the other end, the rotation takes place in the opposite direction. And the framework may be lifted by a string attached near one end of the axis without the gyroscope's falling. Its axis still projects horizontally from the string, but it revolves as a whole round the string. Various other singular experiments may be made with this apparatus; and others, even more curious, with the gyrostat of W. Thomson (q.v.), which is simply a gyroscope enclosed in a rigid case, by which the ends of its axis are supported. When a gyrostat is made the bob of a pendulum under certain conditions, the plane of vibration of the pendulum turns, as in Foucault's celebrated experiment, but in general at a much greater rate.

GYU'LA, a town of Hungary, in the county of Bekes, is situated on the White Körös, which divides it into the German and Hungarian quarters. 30 miles north of the town of Arad. The trade is chiefly in cattle. Pop. (1869) 18,495.

H

H, the eighth letter in the English alphabet, belongs to the order of gutturals and is a mere attenuation of the sound indicated by the Greek χ and the German (and Scotch) *ch*. The tendency of guttural sounds to become lighter and lighter, and at last disappear, is strikingly seen in tracing the history of the letter *h*. The form of the character corresponds to the Phœnician or Hebrew *cheth* and the Greek *eta* (H, probably at one time pronounced *heta*), which denoted originally the *syllable che*. The Greeks dropped the guttural part of the sound, and took the character to mark the vowel ĕ, while in the Latin alphabet it was taken to mark the (faint aspirated) guttural. That the sound of *h* in Latin must have been faint, is proved by the fact, that many words were written indifferently with or without an *h*; as *honustus* or *onustus*; *ahenеus* or *aēneus*. In the languages derived from the Latin, the force of *h* has almost disappeared. It is retained in French as a character, but is scarcely heard in pronunciation. The Italian language altogether ignores the character. In Spanish, it has taken the place in many cases of the Latin *f*, as *hijo* = Lat. *filius*, a son; *humoso* = *fumosus*, smoky.

In the languages of the Gothic stock, *h* often represents the hard guttural sound of *k* or *c*. See letter C. This substitution, and the subsequent disappearing of *h*, especially before *r* and *l*, have completely disguised the relationship of many words which are yet of the same root: e. g., Eng. *raw*; Ang.-Sax. *hreaw*; Lat. *cru*-or blood, *cru*-dus, bloody, raw.

The natural tendency in English, as in other tongues, is to attenuate the sound of *h*, and altogether eliminate it. This tendency is strongest among the illiterate, who are unrestrained by the presence of the written character; and accordingly "to drop one's *h*'s" (e. g., *am* for *ham*) is a sign of the want of education and of vulgarity. The perversity of putting *h* where it ought not to be (e. g., *heggs* for *eggs*), is not easily accounted for.

The Germans use the letter H, in their musical notation, for the same note which we call B, while they call our B flat simply B; possibly from the flat seventh being more nearly related to C, as a fundamental note, than B natural the sharp seventh is, which they designate H.

HAA'RLEM, the chief town of a district of the same name in the province of North Holland, is a clean, well-built city, lying on the shores of the Spaarn, 12 miles west of Amsterdam, and intersected, like most Dutch towns, with canals and avenues of trees. Pop. (1875) 33,364. H. is the seat of government for the province, and the see of a Catholic bishop. Among its 13 churches, the principal is that known as the Great or St Bavo's Kerk, which was built in the 15th c., is one of the largest in Holland, and specially noted for its lofty tower and famous organ, constructed by Müller of Amsterdam, which, till recently, was the largest of its kind, having 5000 pipes, 60 stops, and 4 rows of keys. Before the church stands a statue of Laurens Coster (q. v.), to whom his countrymen ascribe the invention of printing. Among the buildings worthy of note are the town-hall, with its fine carvings, formerly the residence of the Counts of Holland; the palace of the states-general; the prison; and the Teyler Institution, richly endowed to defend the Christian religion and promote science and the fine arts. It has also a handsome building occupied by 24 poor old women, and has numerous scientific and antiquarian collections. H.

Digitized by Google

has a good gymnasium, numerous academical, scientific, and benevolent institutions, and also a national normal school for training teachers. Although H. is no longer celebrated, as in former times, for its flourishing trade, it still possesses extensive refineries of salt, tanneries, foundries for type, various manufactories of silk, linen, and thread, and an extensive trade in flowers, sending its tulips, hyacinths, and other bulbs, to the value, in 1874, of £37,500, to every part of Europe. H. was a flourishing town as early as the 12th c., when it took an important part in the wars between the Hollanders and West Frisians. At the close of the 15th c., it lost its privileges, and suffered severely during the revolt of the peasantry; and during the war of independence, it underwent a seven months' siege in 1572—1573, which is unparalleled in the annals of history for the heroism evinced by the citizens. The wood of Haarlem is a great ornament to the city, and a favorite place for recreation. H. has railway communication with Amsterdam, Rotterdam, and the Nieuwe Diep.

HAARLEM LAKE, which is now drained (see POLDER), lay between the towns of Haarlem, Leyden, and Amsterdam, and communicated with the Zuider Zee by "Het Y." Before its drainage (1839—1852), it embraced the four ponds of Haarlem, Leyden, Spieger, and Helle, which, in consequence of an irruption of the sea in the 16th c., when several villages were destroyed, had merged into one vast sheet of water, and in the course of time encroached so far upon the adjacent land as ultimately to cover an area of more than 60,000 acres. The depth did not exceed 15 feet, more than half of which was composed of mud and clay, from which the Dutch prepared a kind of brick known as "klinkers," used for purposes of paving. The lake frequently rose during storms to an alarming height, necessitating a large annual outlay in keeping the dams and sluices in repair. In consequence of the damage done to Amsterdam and Leyden by an overflow of the lake in 1836, the government entered into an agreement with a company of English engineers to drain it. This undertaking was effected by several gigantic steam-engines, by which the water was pumped up into a canal, formed round the circumference of the lake, and connected with the Ij by various outlets. By these means the waters were drained off, except channels for the purpose of drainage, and more than 50,000 acres of good land reclaimed, producing large crops of colza, flax, wheat, rye, barley, oats, madder, mustard, and other seeds. In 1874, there were 2867 horses, 5897 head of cattle, 7923 sheep, and 1803 goats. Pop. (1875) 12,570, with 2 Dutch Reformed, 2 Dissenting churches, and 3 Roman Catholic chapels.

HABA'KKUK (Greek forms, *Ambakoum*, *Abacum*, &c.; Lat. *Ambacum*, *Ambacue*, and *Abacue*), the eighth of the twelve minor prophets. No account whatever is contained in the book itself either of the events of his life, or even the date when he lived; and the numberless conjectures that have been made respecting him are unworthy of notice. In turning to the book itself, we find him, first of all, bewailing the general corruption of his people, and prophesying the speedy vengeance of God by the hand of the Chaldeans. These, however, shall, when they have fulfilled the divine wrath, perish suddenly themselves, because of their own iniquities; and the prophet winds up with thanks for this just retribution. It is evident from this that H. must have lived at a late period, about the time of Nebuchadnezzar's invasion; but whether he wrote, as the rabbinical traditions suppose—at the time of Manasseh, or as others (Keil, Davidson, Delitzsch) assume, at the early time of Josiah, or, finally, in the days of Jehoiakim, according to Ewald, Rosenmüller, Knobel, Meyer, De Wette, Hitzig, Stähelin, are points upon which we cannot enter. We must not omit to mention here, that the various chapters have also been supposed to have been written under different successive kings (Rosenmüller, Kalminsky, &c.); but the unity of the whole book is so obvious, that this notion has been almost unanimously rejected.

Critics have, in all times, been unanimous in their praise of the style of this prophetic composition. It ranks, indeed, for grandeur and sublimity of conception, for vigor and fervor of expression, for gorgeousness of imagery, for melody of language, among the first very productions of sacred literature. It is more especially the peculiar strophic arrangement of the second chapter, with its awful four "woes" denounced against the Chaldeans, and above all, that matchless "Pindaric Ode," as Ewald calls the third chapter, which have challenged universal attention and admiration.

HA'BEAS CO'RPUS, Writ of, a writ directed by courts of law or equity to produce the body of a person illegally detained, and to state the reasons of such detention, so that the court may judge of their sufficiency. This writ is one of the chief guards of English liberty, and the envy of foreign nations, being one of the best securities against tyranny ever devised. It is often erroneously supposed that this efficacious protection of personal freedom was first bestowed by the statute of 31 Ch. II. c. 2, called the Habeas Corpus Act. But the true foundation of that act, as well as of many other cardinal principles of the English constitution, is to be found in the Great Charter, or Magna Charta, of which Hallam (1 "Const. Hist." 16) observes: "No freeman could be detained in prison except upon a criminal charge on conviction, or for a civil debt. In the former case, it was always in his power to demand of the Court of King's Bench a writ of *habeas corpus ad subjiciendum*, directed to the person detaining him in custody, by which he was enjoined to bring up the body of the prisoner, with the warrant of commitment, that the court might judge of its sufficiency, and remand the party, admit him to bail, or discharge him, according to the nature of the charge. This writ issued of right, and could not be refused by the court." The Great Charter, as Professor Creasy sums up this part of its substance, "contained two great principles. First, that no man shall be imprisoned on mere general grounds of suspicion, or for an indefinite period, at the discretion or caprice of the executive power; but that imprisonment shall be only inflicted as the result of a legal trial and sentence, or for the purpose of keeping in safe custody, when necessary, an accused person on a definite charge, until he can be tried on that charge. Secondly, that, as a general rule, every person accused of a criminal offence shall have the question of his guilt or innocence determined by a free jury of his fellow-countrymen, and not by any nominee of the government." And Blackstone, with great spirit, thus discourses on the social and political effects of this feature of the British constitution (1 Bl. "Com." 135): "Of great importance to the public is the preservation of this personal liberty, for if once it were left in the power of any the highest magistrate to imprison arbitrarily whomever he or his officers thought proper, there would soon be an end of all other rights and immunities. Some have thought that unjust attacks, even upon life or property, at the arbitrary will of the magistrate are less dangerous to the commonwealth, than such as are made upon the personal liberty of the subject. To bereave a man of life, or by violence to confiscate his estate without accusation or trial, would be so gross and notorious an act of despotism, as must at once convey the alarm of tyranny throughout the kingdom; but confinement of the person by secretly hurrying him to jail, where his sufferings are unknown or forgotten, is a less public, a less striking, and therefore a more dangerous engine of arbitrary government. And yet, sometimes, when the state is in real danger, even this may be a necessary measure. But the happiness of our constitution is, that it is not left to the executive power to determine when the danger of the state is so great as to render this measure expedient, for it is the parliament only or legislative power that, whenever it sees proper, can authorise the crown, by suspending the *Habeas Corpus* Act for a short and limited time, to imprison suspected persons, without giving any reason for so doing."

The Habeas Corpus Act, which was passed in 31 Ch. II. c. 2, therefore did not introduce any new principle, but merely defined with greater precision and detail the appropriate remedies, in consequence of the frivolous objections made by the judges in the preceding reign. The substance of these details is as follows: Where any person is committed and charged with crime, the lord chancellor or any of the judges may, unless there has been great delay in application, issue the writ, and order the person to be brought up and discharged with or without bail. The writ is to be obeyed more or less promptly according to the distance, but in no case must the delay exceed twenty days. Any officer or keeper neglecting to deliver a copy of the warrant of commitment, or shifting the prisoner to another custody without cause, shall forfeit £100, and for the second offence £200, and be disabled to hold office. No person once delivered by *habeas corpus* shall be recommitted for the same offence under a penalty of £500. Every person committed for treason or felony may insist on being tried at the next assizes, or admitted to bail, unless the crown witnesses cannot be ready in that time; and if not tried at the second assizes or sessions, he shall be discharged from the imprisonment. The prisoner

Digitized by Google

may apply either to the Court of Chancery, or to the Courts of Queen's Bench, Common Pleas, or Exchequer, and any judge denying such writ is liable to a fine of £500. The writ may be applied for by persons confined in any part of England, or Jersey and Guernsey. Indeed, it was recently held, in the case of Anderson the fugitive slave, that this writ could be applied for by a person confined in Canada or any other of the colonies, even though there were courts established there which had previously been applied to, and had the power to issue the writ, but refused to do so. The judges of the Queen's Bench, on examining the authorities, held that this prerogative power had always been inherent in the English court in favor of British subjects wherever imprisoned, except in a foreign country, and had never been taken away by express statute. There has now, however, been passed a statute (25 Vict.) depriving the English courts of this jurisdiction over the colonies, whenever local courts exist by which such a jurisdiction can be exercised.

As the Habeas Corpus Act extended only to cases where persons are imprisoned on criminal or supposed criminal charges, the other cases being left to the operation of the common law, which was found defective, the statute 56 Geo. III. c. 100 was passed, which extended the writ to other cases. Under this last act, any person confined or restrained of his liberty (otherwise than for criminal matters, and except persons imprisoned under a judgment or decree for debt), may apply to any judge of the common law courts for a *habeas corpus*, on shewing by affidavit that there is a reasonable and probable ground for complaint.

The result is, that in all cases whatever where a person, whether man, woman, or child, is illegally confined in England, the remedy is for some friend to apply for an *habeas corpus*, which, on a good *prima facie* case, will be issued to the person who so illegally confines the applicant; and if such person refuses to make a proper return—that is, shew good legal grounds for what is done—he will be committed for contempt. If the party is confined under recognised authority, as a child by a parent, these facts must be stated. If the party is confined under some legal authority, then the warrant of commitment must be produced, and the rule is that such warrant must set forth the subject matter, and the jurisdiction of the judge or justice who so committed the party, so that the legality of the imprisonment may be judged of.

The Habeas Corpus Act does not extend to Scotland, but in that country similar redress is provided to the subject under the Wrongous Imprisonment Act, 1701, c. 6 (q. v.), which is often called the Scotch Habeas Corpus Act.

Habeas corpus is also the formal commencement of several other legal writs in English law of a kindred nature to that last mentioned, and which is strictly called the writ of *habeas corpus ad subjiciendum*. Thus, the *habeas corpus ad respondendum* is a writ issued by a common law court to bring up a prisoner to serve him with a writ in another action. So a *habeas corpus ad satisfaciendum* is a similar writ to take the prisoner in execution for another cause of action. *Habeas corpus ad testificandum* is the writ by which a prisoner is brought up by the jailer to give evidence as a witness in a court of justice.

HABE'NDUM, in English law, is the name given to a clause in a deed of grant or lease, in which clause the kind and nature of the estate is described, and it is stated for how long the estate is to be held.

HABE'RE FA'CIAS POSSESSIO'NEM, in English law, is the name of the writ which issues after a successful plaintiff has recovered judgment in an action of ejectment. He then calls on the sheriff, by this writ, to put him in possession of the land or premises, and the sheriff executes it by breaking open the doors, if necessary, and then delivering over the possession to the plaintiff. *Habere facias scisinam* is a similar writ, now superseded by the last.

HABE'RGEON, a short coat of mail, consisting of a jacket without sleeves. In early times, the habergeon was composed of chain-mail; but in the 14th c. a habergeon of plate-armor was worn over the hauberk. See HAUBERK.

HABIT. This familiar word applies to a certain portion of our acquired powers or aptitudes. Common usage does not very closely define the kind or extent of acquisitions intended by it. Habits may be either intellectual or moral. We speak of a habit of talking or writing, as well as a habit of early rising or of truthfulness.

Digitized by Google

The principle of the human constitution on which the growth of habit depends, when generalised to the utmost, may be called the power of *retentiveness*, or of plastic growth, and is one of the foundations of the intellect, inasmuch as memory and all the other intellectual faculties involve it in a greater or less degree. See INTELLECT and ASSOCIATION OF IDEAS. Education of every kind must proceed upon this property, and should be conducted in conformity with its exact nature and laws. The maxims that govern the formation of habits are the same as the principles of mental acquirement in every shape. Some of the most important of these may be indicated here.

1. It should be understood, at the outset, that all persons are not alike susceptible of the growth of new powers, or of the process of education; nor is the same person equally susceptible as regards all subjects. The consequence is, that a much greater amount of practice is necessary in one case than in another; iteration being the mode of supplying the defective cohesiveness of the system.

2. However common the remark, that youth is the season for improvement, it may be doubted if we generally appreciate to the full degree the superior plasticity of early years, and the gradual decrease of the property as life advances. The as yet unoccupied state of the infant mind must be taken into account along with the very great energy of the principle of growth, which gives a firmness and security of hold to early impressions beyond everything that is communicated in later life. We see this in the impossibility of eradicating a provincial accent after one has grown to maturity; so the opinions and sentiments contracted in youth can seldom be changed in middle or advanced life.

3. In acquiring habits, the favorable disposition of the mind is of the greatest importance. Liking, taste, or predilection for the task concentrates all the energies of the system upon the work, and favors to the utmost the cementing process. A strong natural liking will often compensate for want of natural aptitude, by making the most of what power there is.

4. In the default of natural liking for the subject, the attention may be secured to a certain extent by pains and penalties; but as these waste and enfeeble the powers of life altogether, there is a loss on the whole, although there may be a gain in the particular case. The education of the young cannot be conducted wholly on the principle of fascination; but if pain has to be frequently or systematically resorted to, no considerable general progress need be looked for.

5. Health, freshness, and vigor in the bodily system are conditions of the growth of habit. The brain may be powerful in a feeble body, but a certain co-operation of the other organs is necessary to the integrity of its functions; and when the stage of nervous exhaustion has been reached, there is nothing gained by continuing the exercise. After adequate rest and refreshment, the plastic property is at its height; there is a limit to what it can perform, which is marked by the approaching sense of fatigue; and at this point the efforts in the way of learning should cease. The prevailing error hitherto has been to overrate this limit, and to keep up school exercises too long at one time. A short intermission enables the work to be resumed.

6. These observations apply to mental acquisitions generally. In the peculiar case of *moral* acquisitions—such as habits of fortitude, courage, contentment, honest dealing, obedience—some special considerations are applicable. In the first place, there must be a powerful *initiative*, or some influence strong enough to make a decided commencement and to keep up the desired conduct for a certain length of time. Either the coercion of some authority, or a powerful example, or an energetic resolution of the individual will, should induce the person to enter on the course prescribed, and to persevere until the plastic process, in other words, the power of habit, has had time to operate. The commencing stimulus may then be gradually withdrawn in favor of the self-sustaining force that iteration has engendered.

HABIT AND REPUTE, a phrase used in Scotch Law to denote something so notorious that it is taken without further proof to be true. The best known example of this is where a man and woman cohabit as husband and wife, and are reputed by the neighbors to be married, in which case the law of Scotland, with great liberality, assumes, as a positive and incontrovertible fact, that a previous marriage had taken place, and no evidence to contradict such a presumption, or legal fiction, is even allowed. In England, no such doctrine prevails, and the marriage would

Digitized by Google

have to be proved in the usual way, if called in question, by a suit which directly raises such question though the parties had all their lives lived together as man and wife.—There is also, in Scotland, an application of the doctrine of habit and repute to persons when convicted of stealing; for if the individual is a habit and repute thief—i. e., a notorious thief—his offence is greater, and liable to a more severe punishment. In England, a somewhat similar effect is produced more circuitously, by proving after the trial that the thief had been several times previously convicted, in which case he is generally punished by a severer sentence.

HABITA'TION, in the Roman Law, meant a servitude by which a person could only use a house as a habitation or dwelling-house, and for no other purpose. In England and Scotland, such a restriction can only be produced by the operation of express covenants or stipulations in the lease.

HA'CKBERRY. See NETTLE TREE.

HACKLÄNDER, Fried. Wilh., a popular German poet, was born at Burtscheid, near Aix-la-chapelle, 1st November 1816. After several vicissitudes, he proceeded to Stuttgart, where he commenced his literary career with "Bilder aus dem Soldatenleben im Frieden," which appeared in the "Morgenblatt," and has since been translated into several languages. The truth and pleasant humor of this little book attracted the attention of Baron von Taubenheim, who invited H. to accompany him on his travels to the East. The literary fruits of this journey were "Daguerreotypen, aufgenommen auf Einer Reise in den Orient" (2 vols. Stuttg. 1842; 2d edit. 1846), and the "Pilgerzug nach Mekka," a collection of Oriental tales and legends. At a later period, he published "Wachtstuben-abenteuer" (a continuation of the "Soldatenleben"), "Märchen," and a variety of smaller works. In March 1849, he went to Italy, was present in the campaign in Piedmont, and afterwards published his "Soldatenleben im Kriege" (2 vols. 1849—1850). In 1849 he married, and settled near Stuttgart, where he has since published several humorous romances: "Handel und Wandel" (2 vols. 1850), "Eugen Stillfried" (3 vols. 1859), "Namenlose Geschichten" (3 vols. 1851), &c. H. has been styled the German Dickens. His comedy entitled the "Geheimer Agent" has been performed on all the stages of Germany and translated into Hungary, Polish, and English. His "Magnetische Curen" was a success. Other works of his are "Ein Winter in Spanien" (1855); "Der neue Don Quixote" (1858); "Künstlerroman" (1866); "Zwölf Zettel" (1867); "Das Geheimniss der Stadt" (1868); the play "Die Marionetten" (1868); and "Kainszeichen" (1874).

HA'CKMATACK. See LARCH.

HA'CKNEY, the name of a parish of England, in the county of Middlesex, which now forms a suburb of London, and is three miles north-north-east of St Paul's. It was at one time a favorite suburban residence of the London citizens, but the current of fashion having for many years been setting to the west, H. no longer holds the rank it formerly did. In its earlier and fashionable days, it is said to have given its name to hackney-coaches.

HACKNEY-COACHMEN differ in no respect from other carriers, except that in addition they are generally put under police regulations in all the towns and cities of the United Kingdom, and a tariff of fares imposed upon them. They require a licence from the town-council or other similar body, and must conform to the regulations imposed by this authority. In London, acts of parliament have been passed to define these regulations, and the legal fare is fixed at 6d. per mile, or part of a mile. In other cities and towns, the legal fare is higher.

HA'DDINGTON, a market town and royal and parliamentary borough of Scotland, capital of the county of the same name, is situated at the foot of the Garleton Hills, on both sides of the river Tyne, about 16 miles east of Edinburgh. The old Abbey Church, a fine Gothic structure, in partial ruin, and situated close to the banks of the river, is the most interesting object in the town. John Knox and George Wishart preached in this church. Among the other principal buildings may be mentioned the Corn Exchange, necessarily a very commodious building, H. being one of the largest grain-markets in Scotland. The inhabitants are chiefly dependent upon agriculture, but there are nurseries, corn-mills, breweries, tanneries, &c., in the town and vicinity. H. unites with North Berwick, Dunbar, Jedburgh, and Lauder in sending a member to parliament. Pop. (1871) 4007.

HADDINGTONSHIRE, or East Lothian, a maritime county in Scotland, lying between n. lat. 55° 4′ and 56° 5′, and w. long. 2° 25′ and 3° 2′, is bounded on the n. and e. by the Firth of Forth and the German Ocean, s. and s. e. by Berwickshire, and on the w. by Midlothian. The extreme length is about 25 miles, and breadth about 17; area, 179,142 acres, or 280 square miles. In the south of the county are the Lammermuir Hills, rising to the height of 1752 feet. In the north and north-east is a strip of level ground of unequal breadth, composed of clay and loam, and mostly very productive for all kinds of crops. The climate is excellent on the lower grounds, and the rainfall much under the average. There are few streams of any considerable size, the principal being the Tyne, which flows north-east across the county into the sea at Tyningham. East Lothian has long enjoyed high agricultural fame. John Cockburn of Ormiston, who is regarded as the father of improved Scottish husbandry, and who was born in this county in the end of the 17th c., was the first to test its capabilities. This enterprising man gave long leases, and encouraged his tenantry to lay out their farms in regular enclosed fields. He introduced the culture of turnips, rape, and clover; and turnips in drills were sown on one of his farms as early as 1725, and brought to such perfection in ten years thereafter, that a specimen of a turnip, weighing 35 pounds, was sent for public exhibition to Edinburgh. Potatoes were also first planted in the fields in 1734 at Ormiston. Pennant says that hedges round fields were first planted in this county, and here the thrashing-machine was first introduced, in 1786, by a native, Andrew Meikle. In September 1862, the first steam-plough possessed by a tenant-farmer in Scotland was introduced into this county by Mr Sadler, Ferrygate. The well-known varieties of wheat, Hunter's, Hopetoun, Fenton, and Shirreff's bearded, all originated in Haddingtonshire.

According to the agricultural statistics taken in 1876, the total number of acres under rotation of crops was 113,615. There were 8879 acres under wheat; 17,202 under barley; 16,296 under oats; 1342 under beans; 2345 under potatoes; 15,899 under turnips; and 26,451 under clover, sanfoin, and grasses under rotation. The number of draught and other horses was 3737; cattle, 7072; sheep, 108,447; swine, 2790. On comparison with the other Scotch counties, it will be found there are only 2 with a greater acreage of wheat and potatoes, 4 with more barley, and 12 with more turnips; while in yield per acre H. occupies a very high position, particularly in its crops of oats. The land rental, exclusive of railways, in 1876—1877 was £304,-312; railways, £26,237. Old valuation (1674), £14,072. Coal and limestone are abundant. The former was wrought in the 13th c., the earliest recorded in Scotland. H. returns one member to the House of Commons; its parliamentary constituency in 1876—1877 was 939. Pop. (1871) 37,771.

Historical interest is confined almost entirely to the battle-field of Dunbar, where Cromwell defeated the Covenanting army in 1650; and Prestonpans, where the Pretender defeated the royal troops in 1745. Among the antiquities may be named the ruins of the Castles of Tantallon, Dirleton, Luffness, Hailes, and Innerwick. The principal towns are Haddington, Dunbar, and North Berwick.

HADDOCK (*Gadus Morrhua Æglefinus*), a fish of the same genus with the cod, and much resembling it in general appearance. The number of fins is the same as in the cod, there being three dorsals and two anals. The H., like the cod, has a barbule at the point of the lower jaw. The H. is brown on the back, silvery on the belly; the lateral line is black, and there is a black spot behind each of the pectorals, these spots sometimes extending so as to meet on the back. A ridiculous legend ascribes these spots to the finger and thumb of St Peter, and states the H. to be the fish from the mouth of which he took the tribute-money, "the inventors of the legend never adverting to the improbability of a marine fish living in the fresh-water lake of Gennesaret." The H., indeed, is not even found in the Mediterranean. Nor does it enter the Baltic, although plentiful in the northern parts of the Atlantic Ocean, both on the European and the American coasts. On the British coasts, it is abundant almost everywhere, appearing in great shoals at particular seasons, but in size and quality the haddocks taken at one part of the coast differ much from those of another. Those of the east coast, and particularly those caught in deep water, are in great esteem, and those of Dublin Bay are remarkable for their large size. A H. of 16 lbs. has been taken in Dublin Bay. Generally, however, this fish is much smaller. It is taken both by trawl-nets and lines. Pieces of the herring and sand

Digitized by Google

eel are most attractive baits. The H., when really of good quality, is perhaps the finest of all the *Gadidæ*; and the numbers taken on some parts of the British coasts are very great, rendering it, in an economical point of view, a very important fish. It does not "take salt" so well as the cod, but is often cured by drying and smoking. In March and April, the H. is out of season; in October, November, December, and January, it is in finest condition. *Finnan Haddocks* and *Berries* are well known, particularly in the Scottish markets.

HA'DERSLEBEN, or Hadersley, a town of the German empire, in the north of the province of Slesvig-Holstein, on the Hadersleben Fiord, a narrow arm of the sea, stretching inland westward from the Little Belt, 33 miles north of Flensborg. The church of St Mary is a large and handsome edifice. H. has a port for small vessels; and a gymnasium. Pop. (1875) 8362. H., which formerly belonged to Denmark, received its town-rights from Waldemar II., in 1292; and here, in 1448, Count Christian of Oldenburg was elected king of Denmark, and began the present dynasty.

HA'DES, in Greek Mythology, was the god of the lower world, more commonly spoken of as Pluto (q. v.); the name was also applied to his kingdom, the abode of the departed spirits or shades. See GREEK RELIGION, also HEAVEN and HELL.

HADITH (something new, a story, legend, tale; emphatically, Hadith Ar-Rasul), the traditions about Mohammed the Prophet's sayings and doings, which, as a complementary to the Koran, form, together with it, the supreme authority for all religious and legal questions of the Mohammedans. Originally, it was not allowed to commit them to writing (like the Mishnah, q. v.), but the danger of their being entirely forgotten in the course of time, led to their being written down in the first centuries after Mohammed. Those who, notwithstanding, know them well by heart are honored with the title of Hafiz (retainer, keeper). The six principal sources for these traditions are Ayeshah, after the death of Chadija, the prophet's favorite wife; Abu Hureira, his constant companion and servant; Abdallah Ibn Abbas; Abdallah bun Omar b. Al-Aas; Djaber b. Abdallah Ansari; and Ans b. Malik. The principal and most authoritative collections of traditions are those of Bochari, Malik, Abu Dhaud, Tarmesi, Nissai, Moslem, and Sojuti. Of these, again, the most important code is the *Sahih* of Bochari, who, it is said, spent sixteen years of his life in travelling through the length and breadth of the land for the purpose of collecting such traditions, and who singled out, from a number of 60,000, about 7270 as genuine. This code was printed for the first time with commentaries (Delhi, 1848—1854), of which only three copies are to be found in Europe—one is at present in the British Museum; and another edition (by Krehl, in Leyden) has been published. See SUNNA, MOHAMMED, MOHAMMEDANISM.

HADJI KHALIFAH, the surname of Mustafa-ben-Abdallah, a celebrated Turkish historian, who was born at Constantinople about the end of the 16th c., and died in September, 1658. From 1622 till 1633, he was employed in the Turkish army, and had an excellent opportunity of acquiring information regarding matters of history, geography, &c., of which he eagerly availed himself.

H.'s works are written in Turkish, Arabic, and Persian. Besides a number of smaller works on geography and history, we have the celebrated "Asam al-kotoub ve al-fonoun" (Names of Books and Sciences), written in Arabic, and of which Flügel has given a translation with the text under the title "Lexicon Bibliographicum et Encyclopædicum a Mustafa-ben-Abdallah" (Leip. 1835—1858. 7 vols.). There is also a French translation by Petis de la Croix (1694—1705), which is to be seen in MS. in the Imperial Library. In this work, H. gives a definition of each science and the principal writers on each; specifies the titles, contents, language, dates of composition, and translations of more than 25,000 works; also the names of the authors and dates of their death. It is the most complete catalogue in existence of works written in Arabic, Persian, and Turkish; "Tarikh Kebir" (Great History), a history of the world from the creation of Adam to 1655, containing notices of 150 dynasties, principally Asiatic; also a history of the Ottoman empire from 1591 to 1658; and a history of the maritime wars of the Turks, which has been translated into English (Lond. 1831).

HADLEY, John, an English mathematician, the intimate friend of Newton, from whom, as is now generally supposed, he borrowed the idea of the instrument called Hadley's Quadrant (see SEXTANT). In 1717, he became a member of the

Digitized by Google

Royal Society, before which he read some useful papers, which were afterwards published in their "Transactions." The honor of having invented the sextant is claimed by their supporters for H., Godfrey, and Newton; for H., because he was the first to construct the instrument, and give a description of it, which he did in 1731, before the Royal Society; for Godfrey, because, in 1730, he presented a gentleman in Philadelphia, United States, with a description of the instrument almost coinciding with H.'s, which description was transmitted to the Royal Society in 1732; and for Newton, because he, in 1727, gave a description of the instrument to his friend Halley, who, for some reason unknown, suppressed it, and it was not till after his death in 1742 that it was discovered. The Royal Society decided that Godfrey and H. were both entitled to the honor of the invention, and accordingly each received a reward of £200. H. died 15th February 1744.

HADRIA'NUS, P. Ælius, a Roman emperor (117—138 A. D.), was born at Rome 24th January, 76 A. D. During the reign of Trajan, who was his guardian, and with whom he was connected by marriage (his father, who was a Roman senator, having married the aunt of Trajan), he filled several high offices in the state. He accompanied the emperor in his wars against Decebalus, where he distinguished himself by his bravery; and in 117, when Trajan set out on his return to Italy, he was left behind with the army as governor of the province of Syria. When the intelligence reached Antioch that Trajan had died in Cilicia on his journey home, H. was proclaimed emperor by the army, August 11, 117 A. D. The state of the empire at the time was extremely critical. Insurrections had broken out in Egypt, Palestine and Syria; Mœsia in the East, and Mauritania in the West, were both invaded by barbarian hordes; while the Parthians had once more asserted their independence, and won several successes over the imperial forces. H., perceiving the advantage of a peaceful policy, wisely resolved to limit the boundaries of the Roman dominion in the East, and concluded a peace with the Parthians, surrendering to them all the country beyond the Euphrates. In 118, he repaired to Rome (where he had been acknowledged by the senate), established his authority by liberality towards thepeople, and suppressed with great severity a patrician conspiracy against his life. The Roxolani (modern Russians), who had made an inroad into Mœsia, were induced to retire by large gifts. In the year 119, for the purpose of becoming acquainted with the state of the provinces, he commenced his celebrated journey, which he is said to have performed chiefly on foot. He visited Gaul, Germany, Britain (where he built the famous wall extending from the Solway to the Tyne), Spain, Mauritania, Egypt, Asia Minor, and Greece, whence he returned to Rome, 126 or 127 A.D., and received the title of *Pater Patriæ*. H. spent the years 132 and 133 in Athens, for which city he had a great predilection. After once more visiting Syria, he returned to Italy, and spent the last years of his life at Rome and Tibur. During the severe illness which carried him off, July 10, 138, at Baiæ, he was subject to violent outbursts of cruelty, to which, as well as to jealousy and pleasure, he was naturally addicted. After the death of Lucius Celonius Commodus, whom he had adopted under the name of Lucius Ælius Verus, he appointed Titus Aurelius (afterwards the emperor Antoninus Pius) his successor. During his reign the army was vigorously disciplined and reorganised, so that the barbarians were not likely to attribute H.'s conciliating and peaceful policy to fear or weakness. As a civil ruler, he merits high praise, particularly for the just and comprehensive view he appears to have taken of his duties as a sovereign. Hence to him is attributed, more than to any other, the consolidation of the monarchical system of Rome. H. also divided Italy into four parts under four consuls, to whom was intrusted the administration of justice. H. erected numerous splendid edifices, the chief of which were—the mausoleum called the *Moles Hadriani*, in Rome (the groundwork of the modern castle of St Angelo), the Ælian bridge leading to it, and the magnificent villa at Tibur. He likewise laid the foundation of several cities, the most important of which was Adrianopolis. H. was a lover of the fine arts (in the history of which, as well as of jurisprudence, his reign forms an important era), of poetry, philosophy, and rhetoric, all of which he attempted. He set a high value on Greek literature, and likewise on the cultus of Greece, and caused himself to be initiated into the Eleusinian mysteries.

HÆMADYNAMO'METER (derived from the Greek words *hæma*, blood, *dyna-*

Digitized by Google

mis, force, and *metron*, a measure) is the name of an instrument devised about thirty years ago by Poisseville for determining the pressure of the blood in the arteries and veins of the living body. The pressure of the blood is measured, as in the barometer, by the column of mercury that it balances. The instrument has been recently improved in various ways, and a contrivance has been added by which the oscillations of the mercury are inscribed in the form of an undulating curve on a cylinder made to revolve by clock-work: the height of the undulations denoting the *pressure*, and their horizontal amplitude the *time*.

HÆMASTA'TICS and Hæmadyna'mics, the Statics (q. v.) and Dynamics (q. v.) of the blood (Gr. *haima*). See BLOOD, CIRCULATION OF THE BLOOD.

HÆMATE'MESIS (Gr. *haima*, blood, and *emesis*, vomiting), a rejection of blood from the stomach, usually in consequence of some morbid change in its mucous membrane. See STOMACH, DISEASES OF. Hæmatemesis is apt to be mistaken for Hæmoptysis (q. v.), unless careful attention is given to the mode in which the blood is ejected. The proper remedies are the liberal use of ice or of ice-cold water; acetate of lead, in doses of two to five grains; tannin, five to ten grains (it must not, however, be given with acetate of lead); oil of turpentine, six to ten drops, repeated every hour or two. The first and the last are perhaps the most effectual means, which can be used in combination. The turpentine may be given whipped up with the white of an egg. It must be discontinued when the symptoms of urinary irritation begin to appear.

HÆ'MATINE, or Hæmato'sine, is the term applied by chemists to the red coloring matter of the blood of the higher animals. In the normal state, it occurs in solution in the interior of the blood corpuscles or cells; but in certain morbid conditions, in which the blood undergoes a species of decomposition, it is deposited in a solid form in the tissues surrounding the smaller vessels through whose walls it has percolated. It can only be isolated in a coagulated form, in which state it has been submitted to analysis by Mr Mulder, who assigns to it the formula $C_{44}H_{22}N_3O_6Fe$. Its chief peculiarity is, that is contains a comparatively large percentage of iron (very nearly 7 per cent.). It is the only constituent of the body (if we except the hair) which does contain this metal.

HÆ'MATITE (Gr. *haima*, blood), a mineral consisting chiefly of peroxide of iron, often occurs in large quantity, and is a valuable iron ore. See IRON. There are two principal varieties, *Red H.* and *Brown Hæmatite*. The former frequently occurs in globular and grape-like masses, with a radiating fibrous structure. It is sometimes of a dull reddish-brown, sometimes of a brilliant bluish-gray color; the streak is blood red. An earthy kind is called *Iron Froth*, and consists almost entirely of peroxide of iron. Brown H. contains about 14 per cent. of water. Its color is generally some shade of brown, sometimes almost black. Different shades of color are often presented in concentric wavy bands. The surface is often covered with a beautiful black varnish, which is sometimes iridescent. It is not unfrequently found crystallised in rhombohedric, prismatic, or tabular crystals. The primary form is a right rhombic prism. Both red H. and Brown H. are found in Britain, but the former more abundantly.

HÆ'MATOCELE (Gr. *haima*, blood, and *kēlē*, tumor), a tumour containing blood; opposed to Hydrocele (q. v.)

HÆMATO'XYLINE is a chromogen (a term used by chemists to denote certain nearly or quite colorless substances, which under certain influences, yield well-marked colors) obtained from logwood (*Hæmatoxylon Campeachianum*). Its composition is represented by the formula $C_{32}H_{14}O_{12} + 6aq.$, and in its pure state it occurs in transparent glistening straw-colored prisms. It has a sweet and not astringent taste, is sparingly soluble in cold water, but dissolves readily in boiling water, alcohol, and ether. The watery solution is not affected by the oxygen of the air, but if a very small quantity of ammonia is added, it assumes an intensely reddish purple color.

Hæmatoxyline is obtained by mixing powdered extract of logwood with quartzose sand (to prevent its agglomeration into lumps), and digesting this powder for several days with about six times its volume of ether. The liquid is then distilled till the residue assumes the consistence of a syrup. If this residue is mixed with

Digitized by Google

water, crystals of hæmatoxyline are in a few days deposited, which on an average weigh about one-eighth of the extract that was employed.

The color reactions of this substance with metallic compounds are singular, and in consequence of the tinctorial power of some of them, deserve a brief notice. Solution of acetate of lead gives with one of hæmatoxyline a white precipitate, which speedily becomes blue; salts of copper give a dirty green precipitate, which also soon becomes blue; chloride of barium produces a red precipitate; protochloride of tin gives a rose-colored, and iron alum, a scanty blackish precipitate.

The purple color which the solution of hæmatoxyline assumes if oxygen and ammonia are present, is due to a decomposition, of which a substance termed *hæmateïa* is one of the products; the compound resulting from the union of hæmateïn and ammonia possessing this tint.

The solution of hæmateïn-ammonia (or hæmateate of ammonia, as some chemists have termed it) yields colored precipitates with many metallic salts; with acetate of lead, it gives a deep blue, with sulphate of copper, a violet blue, with protochloride of tin, a violet, and with iron alum, a black precipitate.

It is upon the various reactions which have been described in the preceding paragraphs that the value of logwood as a dye depends.

HÆMATOZO'A (Gr. *hæma*, blood and *zoön*, a living creature) is the term applied by helminthologists to the entozoa existing in the blood. They occur in mammals, birds, reptiles, fishes, and many invertebrate animals. Some of them belong to the Nematoidea, others to the Trematoidea, and others to the Protozoa. Most of them are microscopic, devoid of generative organs, and exist in the blood, circulating both in the arteries and in the veins. A very small number attain a considerable size, and are provided with organs of reproduction. These larger ones are generally found in some definite part of the circulating system. Thus, for example, in man the *Distoma hæmatobium* is almost entirely restricted to the abdominal venous system; in the horse, the *Sclerostoma aneurysmaticum* to the abdominal arterial system; and in the porpoise, the *Pseudalius filum* to the pulmonary artery and its branches.

Nothing definite is known regarding the origin of these parasites, but certain observations made upon the H. of the frog by Valentin (and subsequently confirmed by Vulpian), lead to the belief that some of the more minute forms are the larvæ of a worm living in the organs surrounding the vessels. We shall restrict our remarks to the H. occurring in man, the horse, and the dog. By far the most important of human H. is the *Distoma hæmatobium* already mentioned. It has only been observed in Egypt, where it is very common, and where it was found by Griesinger 117 times in 383 autopsies. The male, which is the larger of the two, is about 3-10ths of an inch in length. The common Liver Fluke (*D. hepaticum*), has, in one instance at least, been found in the interior of the portal vein. In the various cases in which distomata have occurred in tumors, they must have been conveyed to the places in which they were found by the blood.

In the year 1665, Raysch discovered a large number of small worms in a dilatation of the mesenteric artery of a horse. Sixty years afterwards a second case was noticed, and it is now known that such cases are of extreme frequency. These verminous aneurisms of the abdominal arteries occur in the ass and in the mule, as well as in the horse. The worm found in them is the *Sclerostoma armatum*, one of the Nematoidea, and often more than an inch in length. It is old horses that are chiefly affected; indeed, they scarcely ever seem to escape, for Rayer found these tumors 48 times in the examination of 50 worn-out horses. For much very interesting information on this curious subject, the reader is referred to Rayer's Memoir in the "Archiv. de Médecine comparée" for 1837.

In the dog, H. sufficiently large to be visible to the naked eye are rare. Thirteen such cases are collected by Davaine in his "Traité des Entozoaires," 1860, the worm generally being a filaria. The microscopic larvæ of a nematoid worm are sometimes found in enormous quantities circulating in the blood of this animal. From the examination of the blood of 480 dogs, Gruby and Delafond believe that 1 in every 20 of these animals presents this peculiarity.

In none of the above cases does the presence of these entozoa appear to affect the general health of the individual in whom they reside, whether he be man, horse,

Digitized by Google

or dog.—For further information on this subject, the reader may be referred to Davaine, *op. cit.* pp. 308—342, and Vogel's "Pathological Anatomy," p. 442, &c.

HÆMATU'RIA (Gr. *haima*, blood, and *ouron*, urine), the discharge of blood with the urine, usually from disease of the kidneys or bladder. It is rather a symptom than a disease, and takes its character from the associated morbid conditions of the parts concerned. It is a symptom always of some gravity, but not very often directly fatal. Perhaps the best general remedy is the tincture of the muriate of iron, given in water in doses of twenty drops.

HÆMODORA'CEÆ, a natural order of endogenous plants, consisting of herbaceous plants with fibrous roots, and sword-shaped leaves; differing from *Iridaceæ* in habit, and in having the stamens six in number, or if only three, opposite to the petals. There are about fifty known species, chiefly natives of North and South America, South Africa, the Mascarene Islands, and New Holland. Some of them have beautiful flowers. A red color exists in the roots of some; hence the name BLOOD-ROOT has been given to them. In this order are ranked the *Velloziæ* or Tree Lilies.

HÆMO'PTYSIS (Gr. *ptysis*, spitting), expectoration of blood, a very significant and often dangerous symptom of disease of the lungs or heart, in all cases of great importance, and requiring immediate attention, but apt to be viewed popularly with a somewhat exaggerated alarm. It is seldom directly fatal. It is rather as an indication of dangerous disease, than from its immediate danger, that it requires such careful attention; but unquestionably, it is a matter of common prudence to seek medical advice on the appearance of even the slightest tinge of blood in the expectoration from the lungs. The gravity of this symptom depends very much on its cause. The treatment can scarcely be undertaken without a medical examination; but in case of extremity, it may be desirable to know that repeated doses of Ipecacuanha (q. v.), carried even up to the emetic effect, have often been found serviceable.

HÆ'MORRHAGE (Gr. a bursting forth of blood), a flux of blood from ruptured arteries, veins, or capillaries. See BLEEDING.

HÆMORRHOIDS (Gr. flowing of blood). See PILES, for which disease hæmorrhoids is a technical synonym.

HÆMUS, Mount. See BALKAN.

HÆRE'DITAS JA'CENS, in Scotch Law, means the heritable estate which a deceased person has left, as it remains before the heir has made up a title to it, and when therefore the property lies to a certain extent in abeyance. When a creditor of the deceased wants to recover his debt, he was formerly compelled by a circuitous process first to compel the heir to complete his title, or declare his refusal to do so; but now by the Titles to Land (Scotland) Act, 31 and 32 Vict. c. 101, he merely raises an action in the usual way, and obtains a decree of adjudication, under which he can help himself to the property. The expression of hæreditas jacens is not used in England, where similar niceties of feudal conveyancing have long been extinct.

HÆRE'TICO COMBURE'NDO, an old writ in English ecclesiastical law for burning a heretic, now abolished by 28 Char. II. c. 9.

HAFF, a word now obsolete in current Germany, signifies, in the Danish language, the sea, or a considerable portion of the sea. In German, it occurs only as the proper name of three estuaries of peculiar form on the southern coast of the Baltic—viz., the Stettin Haff (q. v.), the Frisches Haff (q. v.), and the Kurisches Haff (q. v.). Haff-fishing is a term used by the inhabitants of Shetland to signify sea-fishing.

HAFIZ (one who knows the Koran and the Traditions by heart), MOHAMMED, SHAMS-AD-DIN (Sun of Religion), also called LISHAN-AL-GHAID (Voice of Mystery), an eminent Persian divine, philosopher, and grammarian, and one of the greatest poetical geniuses of all times. He was born in the beginning of the 14th c. at Shiraz, and early applied himself to the pursuit of science and learning. His proficiency in various branches of knowledge brought him under the notice of the then reigning House of Muzaffer, and he was not only appointed teacher in the royal family, but a special college was founded for him. His spirit of independence, however, stood in the way of his worldly advancement, and notwithstanding many

Digitized by Google

offers of princely favor, he remained during his whole life in the humble condition of a dervish. The burden of his poetical compositions is for the most part wine, love, nightingales, flowers—in fact, beauty in every form; occasionally also the praise of Allah and the Prophet, and reflections upon the instability of life and its joys; through all of them there runs, however, a withering contempt of all professional piety, mock-humility, and sanctified abhorrence of the good things of this world. These poems are of such exquisite sweetness, that the poet has also received the name of *Tschegerleb* (Sugarlip); and his contemporaries speak of his having drunk from the fountain of life, a draught of which was brought to him, in reward for his untiring perseverance in study, and his power of self-abnegation, by Zikhr (the Mohammedan Elijah) himself. No less remarkable are the sudden and striking transitions in his writings, and the readiness of wit which he displayed on several noticeable occasions during his lifetime.

Hafiz was married, and appears to have reached a happy old age. The time of his death is uncertain, the dates being variously given between the years 791 H. (1388 A. D., the date on his tombstone), and 797 H. (1394 A. D.). The enmity, however, which had been provoked in the breasts of the zealous defenders of religion by the freedom of his manners, and his more than Sufistic contempt for the outward forms of godliness, broke out undisguisedly at his death. The ministers of religion refused to repeat the usual prayers over the dead body, and after long altercations between the members of his family and his enemies, it was agreed that the question, according to the usual custom of the East, should be decided by lot. The result was favorable; whereupon he was buried with great honor. His tomb, situated about two miles to the north-east of Shiraz, has been adorned with the greatest sumptuousness by princes and nobles, and is still resorted to by pilgrims from all parts of Persia. It has been visited and described by Kæmpfer, Pietro della Valle, Chardin, Le Bruyn, Scott Waring, W. Franklin, Ouseley, and others.

How far some of the odes of H. are *bonâ fide* productions of a most licentious nature, or are intended as an allegorical and mystical revelation of things divine in the manner of Sufism (q. v.), as is declared by H.'s pious admirers, is a question which has at different times been raised before ecclesiastical and critical courts. A style brilliant, yet clear—imagery gorgeous, yet clothed in pure and unaffected diction—undulating melody and classical harmony, are the chief characteristics of H.'s anacreontic lyrics, which have not only become the national poetry of his country, but are even appealed to as an oracle on most important questions of peace and war. The number of their commentators is legion; the most valuable notes, however, are those of Shemil, Sururi, Sudi. The "Divan" was first collected by Said Kasim Anvari, after the death of the poet. Lithographed and printed editions of H. have been published at Calcutta (1790 and 1826), at Bombay (1828—1850), at Cawnpore (1831), Bulak (1834 and 1840), Constantinople (1841), &c. A very valuable edition by H. Brockhaus was published at Leipsic in 1854—1861. Of translations in European tongues, we may mention those of Rewitzki in Latin (Vienna, 1771); Richardson, Jones, Ouseley, Hindley, Rousseau, Bicknell (1876) in English; and by Hammer-Purgstall and Daumer, in German.

HAG (*Myxine* or *Gastrobranchus*), a genus of cartilaginous fishes, allied to lampreys, and with them ranked among Dermopterous Fishes by Owen. The fishes of this genus are of low organisation, and seem to connect fishes with cephalopodous molluscs. The vertebral column is reduced to a mere flexible cartilaginous tube, nor are there any other bones. The shape resembles that of an eel or worm, and Linnæus placed these animals among the *Vermes*. The mouth is formed by a mere membranous ring, with a single tooth on its upper part, whilst the tongue is furnished with two rows of strong teeth, and also performs the office of a piston in the use of the mouth as a sucker. Around the mouth are eight barbules or cirrhi, which have been regarded as analogous to the tentacles of the cuttle-fish, and are apparently the principal special organs of sensation. There are no eyes. There are six gill-bags on each side, receiving streams of water from the gullet (*œsophagus*) by as many tubes, the water being admitted to the gullet by an aperture situated rather on the left side, and carried off by a canal which opens about the end of the first third of the length. The tail is surrounded by a narrow fin. The skin is smooth and very unctuous.—One species, the GLUTINOUS HAG,

Digitized by Google

(*M. glutinosa* or *G. cœcus*), is found in the British seas, and is more common on the coast of Norway, where it is an object of dislike to fishermen, as they believe it to enter by the mouths of haddocks and other fishes caught in their lines, and to prey upon them so as to reduce them to mere skin and skeleton. A fish which has been thus treated is called a *robbed fish*. Six hags have been taken out of a single haddock. The hag is also said to make its way into fishes through their skin, and is therefore sometimes called the *Borer*. Some suppose, however, that hags are swallowed by the fishes on which they afterwards prey. The glutinous hag attains a length of 12 to 15 inches, and exudes a mucous fluid, which soon turns into a kind of jelly. It is of a dark-bluish brown color above, and whitish beneath. The quantity of mucus which it exudes is so great that a single hag, confined in a jar of water, soon turns it all into a kind of jelly. The mucus is exuded from lateral pores.

HAGAR (LXX. *Agar*), Gen. xvi. ff., an Egyptian bondwoman of Sarah. This, her Semitic name (the Egyptian is unknown) has been derived from various roots, and has been translated accordingly—"slender," "stranger," and "flight" (in allusion to her after-life). Sarah having remained barren up to a very advanced age, at last gave H. to Abraham, ten years after his sojourn in Canaan, as a concubine—according to the Eastern custom—in the hope of being "edified through her," i.e., establishing a family of her own. H. bore Abraham a son, whom he called Ishmael (God has heard), and in whom he for a time saw the future father of the progeny promised him. But sixteen years later, and when Abraham was (we are told) a hundred years old, Sarah herself bore Isaac; and we find it significantly repeated nine times in seven verses (Gen xxi. 2—9) that Abraham and Sarah were his parents—in repudiation, according to rabbinical authorities, of certain rumors about Isaac's illegitimacy, spread by Hagar. At last the domestic contentions that naturally arose led Abraham, though reluctantly, to cast out H. together with Ishmael. How the two fugitives lost their way in the desert of Beersheba; how the water in the bottle being spent, the broken-hearted mother set herself at a distance from her child, in order that she might not see his death; how her weeping and the loud voice of the boy were answered by an angel, who pointed out a well (Temzem, in the enclosure of Mecca)—all this forms one of the most touching and well-known narratives of the Bible.

In the New Testament, H. is referred to allegorically as Mount Sinai or "the Jerusalem which now is" (Gal. iv. 22). Some rabbinical traditions (Ber. R. 67 d.) identify her with Keturah, the second wife of Abraham, mentioned Gen. xxv. 1; others (Ber. R. 51 d.) make her the daughter of Pharaoh, who, seeing the miraculous interference on behalf of Abraham in Egypt, said: "Better that my daughter should be the slave of this man than the queen of any other." The Mohammedans look upon H. as the legal wife of Abraham, and she is supposed to be buried in Mecca.

HAGBERRY. See BIRD-CHERRY and NETTLE TREE.

HAGEN, an industrious and thriving town of Prussia, in Westphalia, is situated on the Volme, 26 miles west of Arnsberg. It has a pop. (1875) of 24,218, who carry on puddling and ironfounding, manufactures of iron, steel, and copper goods, cloth, leather, paper, &c.

HAGENBACH, Karl Rudolf, German theologian, was born 4th March 1801, at Basel, where his father, Karl Friedrich Hagenbach, author of the "Tentamen Floræ Basileensis," was professor of anatomy and botany. While at the universities of Bonn and Berlin, he became acquainted with the direction given to theology by Schleiermacher; and on his return to Basel, he received, from his intercourse with De Wette, a fresh impulse to the development of his theological opinions. After being an extraordinary professor, he became ordinary professor of theology in 1823, becoming an honorary doctor of theology in 1830. He delivered to public audiences beyond the university, and afterwards published through the press, several courses of lectures on the Nature and History of the Reformation ("Wesen u. Gesch. d. Reformation," 6 vols. 1834—1843; 2d ed., 1851—1856), on the Early History of the Church ("Aeltere Kirchengesch," 2d ed., 1857—1868), and on the Church History of the 18th and 19th Centuries ("Kirchengesch. d. 18 u. 19 Jahrh.," 2 vols., 3d ed., 1856, translated into English). His tabular view of the History of Dogmas

Digitized by Google

(1828), and his compend of the same department of historical theology ("Lehrbuch. d. Dogmengesch.," 2 vols., 4th ed., 1857, translated into English), are highly praised. His "Encyklopädie u. Methodologie d. Theologischen Wissenschaften" is one of the most useful manuals for the student of German theology, and its popularity in Germany has necessitated nine editions. A History of Evangelical Protestantism, several volumes of Sermons, a Memorial of De Wette, and a work on Religious Education in the Gymnasia, have also come from his pen; and he gave proof of his poetical talents in two small volumes of poetry, and in a collection of poems entitled "Luther u. Seine Zeit." H. died in 1874.—Of H.'s brothers, JOHANN JAKOB gained distinction as an entomologist, and EDUARD as a physiologist.

HA'GERSTOWN, a town in Maryland, United States America, 66 miles w.n.w. from Baltimore. It is a well-built town, with twelve churches, two academies, five newspaper-offices, court-house, town-hall, almshouse, and jail. Pop. (1880) 6,627.

HA'GGADA (Heb. from *nagad*, *hagged*, to say, relate) is the free, rabbinical interpretation of Scripture, chiefly for homiletical purposes. As its name signifies, Haggada was something "said" (not "received," like the authoritative Halacha) (q.v.): legend, saga, tale, gnome, parable, allegory; in fact, poetry springing up from the sacred soil, wild, luxuriant, and entangled like a primeval forest. On its three principal directions—the *Peshat* or hermeneutical investigation, *Derush* or practical application, and *Lod* or mystical illustrations—we cannot dwell here, nor can we follow Zunz's minute divisions of Haggada into: 1. Targumim; 2. Haggadistic elements in Halacha; 3. Ethical Haggada; 4. Historical Haggada; 5. Secret esoteric doctrine; 6. Special Haggada. It flowed in an uninterrupted stream for more than a thousand years—from the Babylonian exile to the 10th c. A.D.—and its innumerable authors are either entirely anonymous or at best pseudonymous. It grew into immense dimensions, as, although orally delivered, parts of it were gradually added in the shape of marginal notes or glosses to Bible MSS., or were committed to writing in the shape of independent collections. These either followed the order of the Scripture, and were called after the special biblical book around which they had woven their fabric, or they were arranged and called after the Sabbatical and festive pericopes on which they treated. The most extensive collections, originally composed of single fragments, which have survived are Midrash Rabboth (commenced about 700 A.D., concluded about 1100 A.D.), comprising the Pentateuch and the five Megilloth, and the Pesikta (about 700 A.D.), which contains the most complete cycle of pericopes. Strangely enough, this latter itself had, through the many extracts made from it at an early period (Jalkut, Pesikta, Rabbathi, Sutarta, &c.), fallen into oblivion since the 15th c., until Zunz, in his "Die Gottesdienstl. Vorträge der Juden" (Berlin, 1832), not only proved its existence by evidence, but even restored it out of the fragments and parallel passages; and about the same time, the old MS., which agreed with Zunz's statements to the minutest details, was found by Steinschneider at Oxford.

For the general form of Haggada, its language, its sources, and its development, no less than its vast influence on Christianity and Mohammedanism, and its immense usefulness for historical and theological investigations, we refer the reader to the articles MIDRASH and TALMUD.

Haggada shel Pesach is the name of a ritual, partly in Hebrew, partly in Chaldee, used on the two first evenings of the Passover, which contains, besides a brief description of the exodus, extracts from the Scripture, the Mishna, Tosephta, Mechiltha, Sifri, and the two Talmuds, and some liturgical pieces. Originally within a very small compass, it has been extended to its present larger size by subsequent centuries. Two "Pintim," or religious poems, were added in the 11th c., and four more Hebrew and Chaldee songs (the last originally a German *Volkslied*) as late as the 14th century.

HA'GGAI (*Aggæus*, *Haggæus*), the tenth of the twelve minor prophets, and the first of those who prophesied in Palestine after the Babylonian captivity. Of his own history, nothing positive is known. It is related that he was born in Babylon, of priestly lineage, and came to Jerusalem at a very early age. The Church Fathers suppose him to have been one of the exiles who had returned with Zerubbabel and Joshua; and Ewald infers from ii. 3, that he was one of the few who had seen the first temple, in which case he must have been a very old man when he composed his

Digitized by Google

book. The time of his prophecies, however, is known with accuracy to fall in the 6th, 7th, or 8th month of the second year of Darius Hystaspis (cf. Ezra, v. 1; vi. 14; Haggai, iv. 24) = 520 B.C. Fifteen years had then elapsed since the foundations of the new temple had been laid; but during the reign of Cambyses and Pseudo-Smerdis, the work had been neglected, and even the most zealous men began to think that the time of the re-establishment of the sanctuary was not yet at hand. Suddenly H. presented himself before Zerubbabel and Joshua the high-priest, and strongly urged the re-establishment of the sanctuary, pointing at the same time to the famine in the land, as the divine punishment for the culpable neglect of the people, who only thought of their own houses, and not of that of God. His words made a deep impression, and the building was recommenced (i.). The second discourse of the prophet—about a month later—predicts a still greater glory to the new temple than had belonged to the former (ii. 3—9). Two months afterwards, he had to renew his reproaches against their inertness, and his promises of a blessed future (ii. 10—19). The fourth prophecy (ii. 20—23), delivered on the same day, is directed to Zerubbabel, and foretells great revolutions and political changes; but he, *Zerubbabel*, shall remain a "signet" in the hands of God—i. e., the Jews and their princely leaders would not be harmed.

The style of H. is prosaic, and labors under an uncommon tameness and poverty of expression, principally apparent in the frequent repetition, within the short space of two chapters, of certain words and phrases, which could not well have been purposely retained for the sake of ornamentation (Eichh. Einl., p. 599). There is hardly any parallelism; but the prophet has endeavored to impart a certain vivacity to his writing by means of interrogation. The diction itself is, generally speaking, pure and clear. H.'s name appears joined to that of Zechariah in some of the inscriptions of the Psalms (127 and 145—148 in lxx., 125, 126, 145—148 in Peshito, 111 and 145 in Vulgate), a circumstance which must point to the existence of an old tradition about these prophets having striven for the re-establishment of the music and singing of the psalms in the temple. Some critics suppose our present book of Haggai to be simply an epitome of some larger book, or a condensation of H.'s orally delivered prophecies. However this may be, they have certainly not gained in strength by any such compression, as must well have been presumed.

HAGHE, Louis, a well-known water-color painter of the present day, was born in Belgium in 1802, but settled in London at an early age. He first acquired a reputation as a lithographer, his most splendid lithographic work being Roberts' "Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia." Not less superb were his lithographs of his own drawings of old Flemish interiors. Subsequently, he devoted himself to painting in water-colors, became a leading member of the association formed to promote this branch of art; and in the exhibitions of this Society, his productions have always been among the most attractive. H. displays a decided predilection for the scenery and history of his native land. Among his pictures may be mentioned the "Palace of Courtray," and the "Audience Chamber at Bruges," which are remarkable for their harmony of color, fidelity in detail, and richness of architecture. He obtained a gold medal at the Paris Exhibition of 1855.

HAGIOGRAPHA. See BIBLE.

HAGUE, or the Hague (Dutch, *'s Gravenhage*), the capital of the Netherlands, and the residence of the king, is a pleasantly situated, well-built city in South Holland. Pop. (1875) 97,565. It is intersected in all directions by canals, and shady avenues of linden-trees, and abounds in palaces, public buildings, and stately houses. It has a good public library, containing 100,000 volumes, and fine galleries of paintings, the choicest of which, containing some of the most precious specimens of the Dutch school, is in the palace of the present king. The town contains 20 churches, the most notable of which is the Great Church, founded in 1308, and distinguished for its lofty hexagonal tower with a *carillon* of 38 bells. The H. is the seat of both Chambers of the states-general, and of various tribunals and public offices, in one of which are deposited the archives and state papers which have been preserved by the republican and regal governments of the country for 400 years. In a historical point of view, the most interesting buildings of the H. are the Gevangenpoort, or the prison gate-house, in which Oldenbarneveldt, the brothers

Digitized by Google

De Witt, and many others distinguished in the history of Holland, have at different periods been confined; the Binnenhof, in which the former of these patriots was executed, and which, together with the Buitenhof, forms an irregular mass of public buildings of various ages, enclosed by moats, and approached by draw-bridges. Besides the palace of the king, there are, within the city, several others occupied by different members of the royal family, or with various national collections of interest, the most notable of which is the Muaritz Huis, containing a splendid collection of pictures by the Dutch masters. The palace called 't Huis in 't Bosch (the House in the Wood), which lies on the outskirts of the town, in the midst of a noble wood, is specially worthy of notice for the tapestry, and the frescoes and other paintings which it contains by Rubens, who, in conjunction with several of his most distinguished pupils, painted the ceiling and walls of several of the apartments. The H. is essentially a city of fashion, and its prosperity depends chiefly on the court and nobility. The trade consists principally of book-printing, lithographing, metal-founding, carriage-building, beer-brewing, distilling gin, cabinet-work, rope-spinning, making leather, &c.; and the natives of the port (Scheveningen) gain a livelihood by fishing. In the neighborhood are many handsome country-seats; and not far off is Ryswick, celebrated for the treaty of peace signed there in 1697. Scheveningen is a favorite bathing-place on the sea-coast, with which H. is connected by a broad causeway, bordered with rows of trees. The origin of the H. is very ancient; and as far back as 1250, William, Duke of Holland and Emperor of Germany, erected a hunting-seat there, on the site of an older residence of his predecessors. In the 16th c., it was the seat of government of the states-general; and in the next century, it became the birth-place of many distinguished members of the House of Orange, and amongst others, of William III. of England; while, as the residence of the stadtholders, it was naturally the centre of the numerous important negotiations of European diplomacy, with which they were associated. The H. is connected by a railway with Amsterdam, 36 miles north, and Rotterdam, 18 miles south.

HAGUENAU, a town of the German empire, in the province of Alsace-Lorraine, ceded by the French in the war of 1870—1871, is situated on the Moder, 18 miles n. n. e. of Strasburg. It had been a free town of Germany before it belonged to France. It was founded in 1164 by Frederick Barbarossa, and, as it was intended for the reception of the imperial insignia, it was strongly fortified. It successfully withstood many sieges, especially during the Thirty Years' War; but on its occupation in 1675 by the imperialists, its fortifications were destroyed. On the 17th Oct. and 22d Dec. 1793, bloody battles took place here between the French and Austrians. H. is a place of considerable manufacturing industry. The German spelling is *Hagenau*. Pop. (1875) 11,726.

HAHNEMANN, Samuel, a celebrated German physician, was born in April 1755, at Meissen, a small town in the neighborhood of Dresden, the capital of Saxony. His father—a painter of the ware known as Dresden china—intended his son to follow his own occupation, but they boy displayed so ardent a love of letters that the head-master of the college (*Fürstenschule*) of Meissen afforded him gratuitously all the advantages of that institution, and he remained at it till he was 20 years of age. He then left Meissen, with 20 crowns as his whole fortune, and went to Leipsic, to prosecute his medical studies. Here he maintained himself by translating works out of Latin, French, and English into German. By his industry and frugality, he saved enough of money to enable him to visit Vienna, where under the direction of Dr Quarin, he pursued his studies, and after various vicissitudes of fortune, he returned to Saxony, and settled in Dresden in the year 1784. Here he discovered a new salt of mercury, known by the name of *Mercurius Solubilis Hahnemanni*, and still extensively employed by physicians in Germany. He also published a monograph upon arsenical poisoning, which is distinguished by such accuracy of observation and clearness of diction as to be quoted with approval by Christison and other modern toxicologists. After spending four years in Dresden, where he had for a time the direction of a large hospital, he returned in the year 1789 to Leipsic. In the following year, while translating Cullen's "Materia Medica" out of English into German, his attention were arrested by the insufficient explanations advanced in that work of the cure of ague by cinchona bark. By way of experiment, he took a large dose

Digitized by Google

of that substance, to ascertain its action on the healthy body. In the course of a few days, he experienced the symptoms of ague; and it then occurred to him that perhaps the reason why cinchona cures ague is because it has the power to produce symptoms in a healthy person similar to those of ague. To ascertain the truth of this conjecture, he ransacked the records of medicine for well-attested cures effected by single remedies; and finding sufficient evidence of this fact, he advanced a step further, and proposed in an article published in "Hufeland's Journal," in the year 1797, to apply this new principle to the discovery of the proper medicines for every form of disease. Soon afterwards, he published a case to illustrate his method. It was one of a very severe kind of colic cured by a strong dose of *Veratrum album*. Before this substance gave relief to the patient, it excited a severe aggravation of his symptoms. This induced H., instead of drops and grains, to give the fraction of a drop or grain, and he thus introduced *infinitesimal* doses. Some years later, he applied his new principle in the treatment of scarlet fever; and finding that belladonna cured the peculiar type of that disease which then prevailed in Germany, he proposed to give this medicine as a *prophylactic*, or preventive against scarlet fever. From that time it has been extensively employed for this purpose. In the year 1810, he published his great work entitled "Organon of Medicine," which has been translated into all European languages, as well as into Arabic. In this book he fully expounded his new system, which he called Homœopathy. See HOMŒOPATHY. His next publication was a "Materia Medica," consisting of a description of the effects of medicines upon persons in health. These works were published between the years 1810 and 1821, at Leipsic, where he founded a school and was surrounded by disciples. As his system involved the administration of medicines, each separately by itself, and in doses infinitely minute, there was no longer any need of the apothecary's intervention between the physician and the patient. In consequence of this, the Apothecaries' Company brought to bear upon H. an act forbidding physicians to dispense their own medicines, and with such effect that he was obliged to leave Leipsic. The Grand Duke of Anhalt-Köthen appointed him his physician, and invited him to live at Köthen. Thither, accordingly, he removed in the year 1821, and there he prepared various new editions of his "Organon" and new volumes of his "Materia Medica" for publication. In 1835, he married a second time; his wife was a French lady of considerable position; and in the same year he left Köthen, and settled in Paris, where he enjoyed a great reputation till his death, which took place in the year 1843. On the centenary of his birth-year, in 1855, a statue was erected to his honor at Leipsic, at the expense of his disciples in Germany, France, England, and other countries, with the concurrence of the local authorities, who supplied the site in one of the public places in their handsome town.

H. is universally acknowledged to have displayed great genius, industry, and erudition. Jean Paul Richter calls him "a prodigy of philosophy and learning." He was a man of unblemished purity of morals, and his life, as well as his writings, was characterised by strong natural piety. He left a numerous family of sons and daughters.

HAHN-HAHN, Ida, Countess, daughter of Karl Friedrich, Count von Hahn, a well-known authoress, was born at Tressow, in Mecklenburg-Schwerin, 22d June 1805. At the age of 21, she married a relative of her own; but the union proving unhappy, was dissolved in 1829. The lady sought consolation in poetry and travel, and visited Switzerland, Vienna, Italy, Spain, France, Sweden, and finally Syria and the East. In 1850, sick of her restless and unsatisfactory mode of life, she embraced Roman Catholicism, and two years later, entered the mother-house of the Order of the Good Shepherd at Angers. Her writings, consisting of poems, novels, voyages, &c., are voluminous, and are generally marked by morbid sentimentality and aristocratic prejudice. She is sometimes clever, and even brilliant, but always superficial. Several of her novels have been translated into English.

HAI'DUCKS (i. e., Drovers, from the Hungarian *Hajdú*, plural *Hajduk*), originally a designation of cattle-herds in Hungary. Afterwards, the word came to signify a class of mercenary foot-soldiers ready to accept pay from any one who would employ their services, but displaying great gallantry on the field of battle. The remarkable constancy with which they stood by Bocskai throughout the war of the

Digitized by Google

revolution, was rewarded by that prince with a grant of a district as their own possession, and at the same time with the privileges of nobility. This grant was made by a public decree of 12th December 1605, and was confirmed by the diet in 1613. Except the privilege of exemption from taxes, which Charles III. took away, the Haiducks enjoy all the rights of nobles to the present day. Their residence, the Haiduck district, remains independent of the county authorities, and is under the direct administration of the national government. The Haiduck district lies within the county of North Bihar, between the Theiss and Transylvania, has an area of about 594 sq. m., and six principal Haiduck towns. The capital of the district used to be Böszörmény. The total pop. is about 63,000, all Magyars, and for the most part belonging to the Reformed Church. In 1876, this district was incorporated with portions of two adjoining districts into a new administrative division (called *Haidukencomitat*) with Debreczin for its capital. In course of the present century, the name Haiducks has begun to be applied to the macers of Hungarian courts and the halberdiers of the Hungarian magnates; also to the lackeys and other attendants to German courts.

HAIL, Hailstorm. The word hail, in English, is unfortunately used to denote two phenomena of apparently different origin. In French, we have the terms *grale* and *grésil*—the former of which is hail proper; the latter denotes the fine grains, like small shot, which often fall in winter, much more rarely in summer, and generally precede snow. The cause of the latter seems to be simply the freezing of rain-drops as they pass in their fall through a colder region of air than that where they originated. We know by balloon ascents and various other methods of observation, that even in calm weather different strata of the atmosphere have extremely different temperatures, a stratum far under the freezing-point being often observed between two others comparatively warm.

But that true hail, though the process of its formation is not yet perfectly understood, depends mainly upon the meeting of two nearly opposite currents of air—one hot and saturated with vapor, the other very cold—is rendered pretty certain by such facts as the following: A hailstorm is generally a merely local phenomenon, or at most, ravages a belt of land of no great breadth, though it may be of considerable length. Hailstorms occur in the greatest perfection in the warmest season, and at the warmest period of the day, and generally are most severe in the most tropical climates. A fall of hail generally *precedes*, sometimes accompanies, and rarely, if ever, follows a thunder-shower. A common idea, which has found its way, as many popular prejudices continually do, into scientific treatises, assigns electricity as the origin of hail. But all observation, rightly interpreted, seems to shew that electricity and hail are *results* of the same combination of causes.

When a mass of air, saturated with vapor, rising to a higher level, meets a cold one, there is, of course, instant condensation of vapor into ice by the cold due to expansion; at the same time, there is generally a rapid production of electricity, the effect of which upon such light masses as small hailstones is to give them in general rapid motion in various directions successively. These motions are in addition to the vortex motions or eddies, caused in the air by the meeting of the rising and descending currents. The small ice-masses then moving in all directions impinge upon each other sometimes with great force, producing that peculiar rattling sound which almost invariably precedes a hail-shower. At the same time, by a well-known property of ice (REGELATION), the impinging masses are frozen together; and this process continues until the weight of the accumulated mass enables it to overcome the vortices and the electrical attractions, when it falls as a larger or smaller hailstone. On examining such hailstones, which may have any size from that of a pea to that of a walnut, or even an orange, we at once recognise the composite character which might be expected from such a mode of aggregation. Hailstones are reported to have fallen in tropical countries sometimes as large as a sheep, sometimes as large as an ox, or even an elephant! But it is probable that the aggregation in these cases was produced by regelation at the surface of the earth, when a series of large masses had impinged on each other, having fallen successively on the same spot. Whether this be the true explanation or no, it is certain that in British India, at the warmest season, hailstones have remained of considerable size for many days after their fall. A curious instance of the fall of large hail, or rather ice-masses, occurred on one of Her Majesty's ships off the Cape in Janu-

Digitized by Google

ary 1860. Here the stones were the size of half-bricks, and beat several of the crew off the rigging, doing serious injury.

We may conclude by a description (taken from "Mem. de l' Acad. des Sciences," 1790) of one of the most disastrous hailstorms that has occurred in Europe for many years back. It illustrates very happily the greater part of what we have said about the origin of this meteor. This storm passed over parts of Holland and France in July 1788. It travelled *simultaneously* along two lines nearly parallel—the eastern one had a breadth of from half a league to five leagues, the western of from three to five leagues. The space between was visited only by heavy rain; its breadth varied from three to five and a half leagues. At the outer border of each, there was also heavy rain, but we are not told how far it extended. The general direction of the meteor was from south-west to north-east. The length was at least a hundred leagues; but from other reports, it may be gathered that it really extended to nearly two hundred. It seems to have originated near the Pyrenees, and to have travelled at a mean rate of about sixteen and a half leagues per hour towards the Baltic, where it was lost sight of. The hail only fell for about seven and a half minutes at any one place. The hailstones were generally of irregular form, the heaviest weighed about eight French ounces. This storm devastated 10.9 parishes in France alone, and an official inquiry fixed the damage at about 24,690,000 francs—nearly a million of English money.

HAIMHALDA'RE, an old Scotch law-term, meaning to recover one's goods and bring them home again—now disused.

HAI'MSUCKEN, or Hamesucken, a Scotch law-term, denoting the offence of feloniously assaulting a man in his own house or lodgings. This was an aggravation of the ordinary offence of assault. It was not so in England, where there is no peculiar name to distinguish this from other assaults.

HAIMU'RA (*Erythrinus macrodon*), a large fresh-water fish of Guiana, highly esteemed for the table. It belongs to a small family of fishes, *Erythrinidæ*, exhibiting relations to the herring, salmon, and carp families. It is sometimes four feet in length. The teeth are large and so formidable, that instances are said to have occurred of a captured H. biting off a man's hand. The H. abounds particularly in the upper parts of the rivers of Guiana.

HAINA'N, a large island in the China Sea, constituting a department of the province of Kwang-tung, is about 180 miles long and 100 broad, and is separated from the mainland by a strait 15 miles wide, filled with shoals and reefs. Its principal city, Kiung-chau, in 2° 7′ n. lat., and 110° 15′ e. long., is the most southern of the ports open for trade. The interior of the island is mountainous, and the inhabitants give but a partial submission to the Chinese. The population is about 1,500,000. Its productions are rice, sweet potatoes, sugar, tobacco, fruits, timber, and wax. Typhoons or cyclones are frequent off the coast during the summer months. Whaling is pursued here with success by Chinese fishermen.

HAINAUT, or Hainault (Ger. *Hennegau*), a frontier province of Belgium, is bounded on the e. by the province of Namur, on the n. by the provinces of Brabant and East and West Flanders, and on the s.w. by France. Area, 1424 square miles; pop. (1874) 949,346. The surface consists in the north and west of flat and fruitful plains, the south is occupied by the Forest of Ardennes. Hills occur only in the south-east, and consequently the course of most of the rivers is towards the west and north-west. The principal rivers are the Haine—from which the province has its name—the Scheldt, the Dendre, and the Sambre, the last a tributary of the Meuse. The soil is highly productive; wheat and flax are very extensively grown. Excellent breeds of horses, horned cattle, and sheep are reared. Toward the west, in the neighborhood of Mons, are very extensive coal-fields. There are in this district more than 200 coal-pits, from which about 2,000,000 tons of coal are annually exported. Iron is also produced in considerable quantity, and marble, building stone, and limestone are quarried. Linen, porcelain, and pens are extensively manufactured.

HAINAUT, French. See the French department of NORD.

HAINBURG, or Hainburg, a small but old and interesting town of Austria, in the crown-land of Lower Austria, is situated on the right bank of the Danube. 27

Digitized by Google

miles east-south-east of Vienna, and two miles from the Hungarian frontier. It is surrounded by old walls, pierced by two castellated gates, and contains an imperial tobacco factory, the largest in the country, an institution for cadets, and an infantry school. Among its more notable edifices are the town-house, with a Roman altar, a tower, called the Roman tower, with the supposed statue of Attila, and on the summit of the Castle Hill the remains of an old castle, destroyed in 1596, when its powder magazine was struck by lightning. Pop. (1869) 4178.

Many consider H. the ancient *Carnuntum*, once an important Roman stronghold and the station of the Danubian fleet, and which rose to its highest prosperity during the reign of M. Aurelius. However this may be, it is certain that considerable remains of the fortifications of the *Carnuntum* are found in the immediate vicinity. A Roman aqueduct still supplies the market of H. with water. In the *Nibelungenlied*, the castle of Hainburg is called Helmburc, the border fortress of the country of the Huns. It was forcibly torn from the Hungarians in 1042 by the Emperor Henry III., and afterwards it became a residence of the Austrian princes.

HAI'NICHEN, a town of Saxony, 28 miles west-south-west of Dresden, on a tributary of the Mulde. Wool-spinning, weaving, and the manufacture of cloth are carried on. Pop. (1871) 8331.

HAIR, including bristles, wool, fur, &c., is a modification of the Epidermis (q. v.) and consists essentially of nucleated particles. An ordinary hair consists of a *shaft* and a *bulb*. The shaft is that part which is fully formed, and projects beyond the surface. If we trace it to the skin we find it rooted in a follicle in the cutis or true skin, or even in the connective or cellular tissue beneath it. This follicle is bulbous at its deepest part, like the hair which it contains, and its sides are lined with a layer of cells continuous with the epidermis. The layer, according to Todd and Bowman, "resembles the cuticle in the rounded form of its deep cells, and the scaly character of the more superficial ones, which are here in contact with the outside of the hair. The hair grows from the bottom of the follicle, and the cells of the deepest stratum gradually enlarge as they mount in the soft bulb of the hair, which owes its size to this circumstance. If the hair is to be colored, the pigment cells are also here developed. It frequently happens that the cells in the axis of the bulb become loaded with pigment at one period, and not at another, so that, as they pass upwards in the shaft, a dark central tract is produced, of greater or less length, and the hair appears here and there to be tubular. The shaft is much narrower than the bulb, and is produced by the rather abrupt condensation and elongation into hard fibres of the cells, both of those which contain pigments and those which do not." If the tissue is softened by acetic acid, and these fibres may be readily seen under the microscope; they seem to be united into a solid rod by a material similar to that which cements the scales of the cuticle. The central cells, when filled with pigment, have less tendency to become fibrous than those lying more externally; and hence some writers have described the centre as a *medulla*, in distinction from the more fibrous part of the shaft, which they term the *cortex*. (This tubular character is constant in the hair of many animals, but is very variable in human hair, and even in the same hair at different parts of its length.) The term *cortex* or *bark* is more correctly applied to the single outermost layer of cells which overlap one another, and cause the sinuous transverse lines which are seen on examining a hair under the microscope.

In some hairs, especially those which act as tactile organs in some of the lower animals (as, for instance, in the whiskers of the various cats), a true papilla, furnished with nerves and capillaries, projects into the hair-bulb, and an approach to this papillary projection may often be seen in human hairs.

The hairs, like epidermis, are thus seen to be organised, and to maintain a vital, although not usually a vascular connection with the body. The color of hair seems to depend on the presence of a peculiar oil, which is of a sepia tint in dark hair, blood-red in red hair, and yellowish in fair hair. This oil may be extracted by alcohol or ether, and the hair is then left of a grayish-yellow tint. The chemical composition of hair closely resembles that of horn, and will be described in the article HORNY TISSUES.

Hair is extremely strong and elastic, and hence its uses for the construction of

Digitized by Google

fishing-lines, the stuffing of cushions, balls, &c. Amongst its other physical properties, we may mention that, when dry and warm, it is easily rendered electrical, and that it is extremely hygroscopical; readily attracting moisture from the atmosphere, and no doubt from the body also, and yielding it again by evaporation when the air is dry. Hairs elongate very considerably when moist—a property of which Saussure availed himself in the construction of his hygrometer, in which a human hair by its elongation and contraction, according as the atmosphere is moist or dry, is made to turn a delicate index.

Hairs are found on all parts of the surface of the human body except the palms of the hands and the soles of the feet; they differ, however, extremely in length, thickness, shape and color, according to situation, age, sex or race. The differences dependent on situation, age and sex, are so obvious that we shall pass them over without notice, and proceed to the most important differences dependent on race. With respect to the quantity of hair that grows on the human body, there are great differences in different races. The Mongols, and other northern Asiatics who are similar to them, are noted for the deficiency of their hair and for scanty beards, and the same character is ascribed to all the American nations; while, on the other hand, among the *Ainos*, or in the Kurilian race, there are individuals who have the hair growing down the back and covering nearly the whole body. The northern Asiatics and the Americans have generally straight lank hair, while Europeans have it sometimes straight and flowing, and occasionally curled and crisped. Negroes present every possible gradation, from a completely crisp, or what is termed woolly hair, to merely curled, and even to flowing hair; and a similar observation holds regarding the natives of the islands in the great Southern Ocean. As there is a generally diffused opinion that the head of the African is covered with a species of wool instead of with true hair, we may mention that all true wools which have been examined microscopically (as merino wool, the wool of the tiger, rabbit, bear, seal, and wolf-dog, which were investigated by the late Mr Youatt), present a more or less sharply serrated or jagged surface, while hairs present merely an imbricated appearance. This characteristic of wool is shewn when represented by a fibre of merino wool, viewed as a transparent, and as an opaque object. "Hairs of a negro, of a mulatto, of Europeans, and of some Abyssinians sent to me (says Dr Prichard) by M. d'Abbadie, the celebrated traveller, were, together with the wool of a southdown sheep, viewed both as transparent and opaque bodies. The filament of wool had a very rough and irregular surface; the filament of negro's hair, which was extremely unlike that of wool and of all the other varieties mentioned, had the appearance of a cylinder, and the coloring matter was apparently much more abundant than in the others." It is in consequence of the above named difference between hair and wool that, although the former will entangle to a certain degree, it will not felt into a compact mass, which is the characteristic property of good wool.

The grayness of hair in advanced life results from a deficient secretion of pigment. Well-authenticated cases are on record in which the hair has grown gray or white in a single night, from the influence of fear, distress or any variety of strong mental excitement. It is not easy to explain this phenomenon. Vauquelin suggested that it might result from the secretion at the bulb of some fluid (perhaps an acid), which percolates the hair, and chemically destroys the coloring matter.

The chief use of the hair, and particularly of the fur of various mammals which is especially developed in the winter, is to protect the body from external cold. Except on the scalp, and on the throat, this cannot be considered as applying to man. What, then, are the uses of the hair on the face, and especially on the upper lip? We shall answer this question with an extract from an article "On the Use of Hair" in "The Lancet" for November 3, 1860: "Mr. Chadwick, who has done so much for sanitary reform, tells us that he was once very much struck by seeing some blacksmiths who wore beards, with their moustaches discolored by a quantity of iron dust which had accumulated amongst the hairs. Turning it over in his mind, it struck him that had not the dust been so arrested by a natural respirator, it must have found its way into the lungs, where it could not have been otherwise than productive of evil consequences. He hence rightly advised that the razor should be discarded by laborers in all dusty trades—such as millers, bakers, masons, &c.; by workmen employed in grinding iron or steel; and by travellers on dusty roads. In hot, sandy countries, the use of the beard is soon discovered; and travellers in Syria

Digitized by Google

and Egypt find it necessary to defend their mouths against the entrance of the hot air of the desert. But not against dust alone is the facial hair a protection; it is the best barrier against cold air, biting winds, and wheezy fogs that a Northman can obtain . . . According to Mr. Chadwick, the sappers and miners of the French army, who are remarkable for the size and beauty of their beards, enjoy a special immunity against bronchial affections." In corroboration of the last-named fact, we may mention another of a still more striking character. During the long-continued search for Franklin's expedition, a transport vessel, the *North Star*, was frozen up during one of the severest arctic winters on record, in Wolstenholme Sound. The crew maintained their health perfectly during all the trials to which they were exposed. On their return to England in the early summer, they shaved off the hair that had been growing around the mouth and throat for the last eight or nine months, and within a week *every man* was on the sick list with some form of bronchial or pulmonary disorder.

The length to which the hair of the head may grow normally, especially in women, is very considerable. In the "Hair Court" of the International Exhibition (1862), there was a beautiful specimen of jet-black hair (British, we believe) measuring 74 inches.

Cases occasionally occur where there is an abnormal abundance of hair of considerable length in women, on parts where the hair is usually little more than down. A hairy lady, named Julia Pastrana, supposed to be a Mexican, was some years ago exhibited in London. Her embalmed body was exhibited also in that city in 1862, and we extract the following remarks from a memoir on her in "The Lancet" for May 3 of that year: "The ears, and all parts of the face except the eyes, were covered with hair of different lengths. The beard was tolerably thick, the hairs composing it being straight, black, and bristly, the part of it which grew on the sides of the chin hanging down like two plaits. . . . The upper portion of the back of the neck and the hinder surface of the ears, were covered with hairs. On the shoulders and legs, the hairs were as abundant as they are occasionally seen on very powerful men."

Dr Chowne has described similar but less marked cases of hairy women in "The Lancet" for 1843.

HAIR-DRESSING. As a matter of convenience, as well as of taste and fashion, the dressing of the hair has received much attention in all civilised nations, ancient and modern. The growth of hair on the sides and lower part of the male face has caused some perplexity in management, and as a method of overcoming the difficulty, shaving has been resorted to, although at the sacrifice of what nature gives to distinguish the male from the female countenance, and also to protect the respiratory organs. See BEARD. The Jews, by their scriptural law, were enjoined not to shave. The Romans shaved, and so did their immediate successors, the Romanised Britons. The Saxons and Danes did not shave, and wore long hair. The Normans shaved, but they, too, adopted long hair as a fashion; and from them, and the more modern French, the courtiers and cavaliers of the 17th c. adopted the practice of wearing those flowing "love-locks" which excited the ire of the Puritans. It was, however, in the management of ladies' hair, that the art of the professional hairdresser was in those times mainly exercised. In the 18th c., through the influence of French fashions, the dressing of hair, male and female, rose to a great pitch of extravagance and folly. The hair of a lady of fashion was frizzed up in convolutions and curls, decorated with ribbons, jewels, and feathers, and filled with pomatum and powder to a degree that was perfectly monstrous. As women of less exalted rank slavishly attempted to follow these absurdities, the business of dressing hair was extensively followed. The cost of a full dressing being, however, too high to be lightly incurred, often one dressing was made to suffice for a week or fortnight, during which period such care was taken to preserve the greasy fabric undisturbed, that it became the resort of insects, and how to extinguish these odious pests was in itself a matter of serious concern. From pressure of business, it frequently happened that, previous to balls, ladies' hair had to be dressed one or two days in advance; and to keep the head-dress uninjured, the lady sat in a chair perhaps two nights, instead of going to bed. The writer of this has conversed with a lady who in this manner sat up one night for the sake of her finely powdered and frizzed-up hair. A taxation on hair-powder, along with the simplification of fashions

Digitized by Google

consequent on the French revolution, not only expelled hair-powder and perruques, but brought the profession of hair-dresser within reasonable bounds. As regards ladies' hair, fashion is constantly altering; and at present the chignon, consisting of cushions at the back or top of the head, and covered with hair, is gradually giving way to a system of coils and plaits. With respect to men's hair, short cutting is now universal, and any indulgence in long hair behind is thought to mark a degree of slovenliness or whimsicality of fancy. Pursued as an ordinary business in England and continental countries, hair-dressing in the United States is entirely resigned to men of color, and in connection with many of the hotels they are provided with workrooms.

Innumerable are the oils, essences, and pomades which are vended for the hair, on the assumption that they improve and nourish it. According to the experience of the best perruquiers, all such applications, any unguent in particular, and however sanctioned by tradition, are injurious. In ordinary circumstances, regular but not violent brushing is preferable for maintaining cleanliness and glossiness. When the head becomes affected with scurf which the brush does not remove, let the following efficacious and simple method of purification be adopted. Beat up an egg, and rub it well in all over the head; then pour over it warm water, which, while removing the egg, will likewise carry away all the scurf; lastly, dry thoroughly with a cloth. The head may be hung over a small tub during the process. After this, the hair will be very clean, and will take on a fine gloss with a brush. On no account use sharp combs to clean the head, for they are apt to irritate the roots of the hair, and after all fail in the desired object.

HAIR DYES. Various means have been adopted for changing the natural color of the hair to a more favored one, and for hiding the approaches of age, as indicated by the presence of gray hairs. These usually consist in washing the hair with a solution of some metallic salt known to have the effect of darkening its color. These are the salts or oxides of silver, mercury, lead, and bismuth. The most perfect mode of dyeing the hair, however, is that of previously preparing it by a complete soaking with a solution of sulphide of potassium; the strength of this solution must depend on the depth of tint intended to be given; the stronger the solution, the darker the color will be. When thoroughly wetted, the hair is allowed to dry partially; and whilst still damp, it is to be again thoroughly wetted with a solution of nitrate of silver, also proportioned in strength by the same rule as in the case of the solution first applied. This makes a very permanent dye, which only requires renewing as the new growth of hair becomes conspicuous. The fashion of dyeing the hair is very ancient, and belongs as much to savage as to civilised nations; but in the case of the former, vegetable dyes have been chiefly used; and the ladies of China and other eastern countries also resort to the same: the juice of the petals of Hibiscus Trionum, the Bladder-Ketmia, and probably other species of Hibiscus, is in general use with them.

The detection of stained hair is sometimes an object of medico-legal investigation. Lead may be detected by boiling the hair in dilute nitric acid, and then applying the tests for Lead (q. v.) to the acid solution; while the presence of silver may be shewn by digesting the hair in dilute hydrochloric acid or chlorine water, when the resulting chloride of silver may be dissolved out with a solution of ammonia, and submitted to the ordinary tests for Silver (q. v.).

HAIR GRASS (*Aira*), a genus of grasses, having loosely panicled flowers, and two unequal glumes containing two perfect florets, each with two thin membranous palese, of which the outer is generally awned near the base. The species are natives of temperate and cold climates. A number of them are natives of Britain, some of which are of very humble growth, and are chiefly found in moors, sandy pastures, and other situations where the soil is unfertile. The TUFTED H., or TUFFY H. (*A. cæspitosa*), common in better pastures and meadows, is a beautiful grass when in flower, but forms coarse tufts; has very rough leaves, which, if drawn roughly across the hand, inflict considerable wounds, whence the plant sometimes receives the name of "Cutting Grass." It is rejected by cattle, if other herbage is within their reach. It attains a height of 2—4 feet, and is sometimes used for thatching ricks of hay or corn, and in some places for making mats. It grows luxuriantly in moist situations, and indicates a soil in want of draining. It is sometimes tolerated,

Digitized by Google

in order to add to the bulk of *Bog Hay* in moorish grounds, but is carefully extirpated wherever agricultural improvement takes place. For its extirpation, drainage is requisite above all things; but the digging out of the tufts is also practised, and other grasses are sown instead. This grass is, however, sometimes sown to form cover for game, particularly hares; and in marshy situations, for snipes and wild fowl. It is the *windlestrae* of the Scotch.—Allied to the genus *Aira* is *Catabrosa* (q. v.).

HAIR MANUFACTURES. These consist of fabrics woven or felted of various kinds of hair; brushes made of particular kinds of hair; and ornamental hair-work.

Woven Fabrics.—The most important in this country is the horse-hair cloth so extensively used for covering the seats of chairs, couches, and other articles of furniture; this is made of the long hair of horses' tails. As the hair is of such various colors, it is necessary to dye all the darker shades so as to produce a uniform glossy black; this is done by logwood and sulphate of iron (copperas) in the following manner. The hair must first be cleansed and deprived of its grease by soaking it in lime-water for a day; it is then transferred to the dye-vat, which is thus prepared for a hundredweight of hair. Sufficient water to fill a boiler large enough to receive the hair, is boiled with 60 lbs. of cut logwood for three hours, after which it is suffered to cool, when 2 lbs. of copperas are added. This constitutes the bath, as it is called; and the hair, after being removed from the lime-water, and well washed in soft-water, either rain or river, is immersed in it for 24 hours; it is then removed, and again washed, to free it from the superfluous dye, dried, and shaken out ready for use. Perfectly white horse-hair can be dyed various colors, and is well adapted to receive the brighter ones, hence it has been much used of late years to produce ornamental hair-cloths, which are in great request abroad, especially in South America. The weaving of horse-hair cloth is different from that of other tissues, in consequence of the shortness of the hair, which, for the same reason, can only be used for the weft, except in the open or sieve cloth, which is only made in small squares for the sieve-makers. Each hair has to be worked singly, and the loom requires two persons to work it. The warp used is either worsted, cotton, or linen yarn, generally the last. The hairs for the weft are kept wet by the side of the weaver, and are handed to him one by one. He receives them on a kind of hook at the end of his shuttle, the hook catching a knot tied by the attendant child who hands the hair. In other respects, the weaving differs little in its general character from that ordinarily employed for other fabrics. When the web is completed, it is dressed by calendering, which gives it a smooth and glossy surface. It is to be regretted that the popular taste in Great Britain does not turn to the ornamental kinds, which are not only very beautiful, but are durable and easily cleaned. The true crinoline cloth, for ladies' dresses, &c., was at first made of horse-hair, usually the white kind; but the immense demand led to the introduction of Agave or Aloe fibre, which soon supplanted it for most purposes, except the manufacture of bonnets, for which it is largely employed both as a material for the body of the bonnet and also as a trimming. The trade in crinoline trimming in Switzerland and France is large, and considerable quantities are imported into Britain. Horse-hair is twisted into thick yarn, and woven into sacking in the ordinary way, in Anatolia and Roumelia; and cow-hair is worked up into a rough yarn, and is woven into carpets in Germany; and in Norway is made into socks by the peasants. Pig's hair is similarly employed in China; and amongst the natives of the Hudson's Bay territories, dog's hair is used for the same purpose. The goat's hair of Tibet and Persia, and the camel's hair used in weaving, belong rather to the true wools, and will be treated of under WOOL.

The difference between hair and wool depends chiefly upon the greater or less smoothness of the surface of each fibre, hence the hairs which are smoothest cannot easily be felted, for if brought into contact, they have no projections of the surface to keep them from slipping away from each other; but some of the hairs proper, by a little preparation, may be so roughened as to fit them for felting. Thus, coney wool, or the hair of rabbits and hares, if properly moistened with a solution of nitrate of mercury, loses its straight and smooth character in drying, and is then readily felted.

The shorter kinds of horse-hair from the manes and tails, also cow-hair and the

Digitized by Google

softer kinds of pig-hair, are twisted into ropes, which, after being boiled and then thoroughly dried in an oven, are pulled to pieces. The hair retains the twist given it, and is then used for stuffing seats of chairs, &c.

Brushes of hair are of various kinds; some are made of the stiff hairs from the backs of pigs, and others are made of the soft hairs of the camel and other animals. The hairs for the first kind are called bristles (see BRISTLES), which constitute an important trade with foreign countries. They are chiefly used in the manufacture of hair and clothes brushes, tooth and nail brushes, house-sweeping brooms, the larger kinds of painters' brushes, &c. The second kind are chiefly employed in the manufacture of the fine brushes or hair-pencils used by painters and artists. The best bristles come from Russia. Besides the camel, hairs are yielded for this purpose by the badger, sable, goat, dog, &c. In both cases, the sorting of the hairs into lengths is a very important and troublesome matter. Generally it is done by placing the hairs in small boxes (with the tips upward), sufficiently deep to keep them upright; and the sorter then, with nice eye and hand, selects the sizes, by pulling out all the longest, as they overtop the others; then the next size, and so on. This, in the case of the hairs for artists' pencils, is an extremely difficult operation, as great exactness is necessary. Several attempts have been made, in Russia and in this country, to sort bristles by machinery, and one person has succeeded in doing so with a rude wooden machine. But the really successful manufacture of a machine which can be made generally available, belongs apparently to Mr. W. S. Yates of Leeds, who exhibited in the International Exhibition (1862) a machine of great beauty and simplicity, which sorts into ten sizes and with great rapidity. Most hair-brushes are required to have the bristles or hairs placed with great evenness, so as to form a flat surface outward; but in the case of those which are called artists' and painters' pencils, their value consists in having a fine point, so that the selection of the hairs so as to insure this, is a work of difficulty. The first step is, after selecting a small quantity, to see that all the tips are in one direction; this is usually done in removing them from the skin, a pair of flat-bladed pincers being employed to hold each cut of hairs, whilst the knife or shears severs them from the skin. They are then placed in small shallow tin boxes, with the tips upward; and the box being carefully shaken, and gently struck on the bottom until the hairs have completely arranged themselves in an upright position, they are then picked out, as before described; each size is placed by itself; and the brushmaker, according to the kind of pencil he is making, takes the proper size, and separating a sufficient number, they are placed upright in another little tin box, but now with the root-end of the hairs uppermost, so as to insure the tips being perfectly even, which is further insured by gently tapping the box as before. Fine thread is then looped round the base of the little bundle of hairs, and securely tied; sometimes more than one ligature is thus made; and the brush, now so far completed, only requires its handle of quill or wood, according to its size and character. Artists' pencils being of various sizes, and many extremely small, several kinds of quills are required. These are obtained from several birds, as the swan, goose, duck, fowl, pigeon, lapwing, and even such small ones as the lark and thrush. Previous to receiving the brush, the quills, besides being cut to the required lengths, have to be further prepared by soaking in water, to prevent them splitting, as the thick end of the brush is being pushed down from the wider to the narrower end. They also contract somewhat in drying, and consequently hold the brush very tightly.

Ornamental Hair-work consists chiefly of the human hair plaited into chains, guards, &c., or worked up into various other fanciful devices, as souvenirs, &c. Under this head we may also mention those manufactures of the human hair which are either required to supply a personal deficiency, or to meet the demands of fashion. To the former class belong the wig, the front, and other imitations of the natural covering of the human head; and to the latter a variety of contrivances, whose mysterious names are only known to barbers and ladies' maids, for the purpose of giving an appearance of greater abundance to the natural supply.

The wig, like all other portions of human attire, has undergone a great many variations in fashion. In the present day the great object is, in the first place, as far as possible to imitate nature and deceive the eye; and secondly, to produce wigs of extreme lightness—a full-sized peruke rarely being more than two or three ounces in weight. A full head of hair from a young woman's head will sometimes weigh

Digitized by Google

five or six ounces. There are two heads of hair in the South Kensington Museum which are in the raw state as imported, and weigh together 11½ ounces.

The chief portion of the hair used in Great Britain is received through French dealers, who collect it from Holland and Germany as well as from the various departments of their own country. The light colors are usually obtained from the former countries, and the dark shades from Brittany. This does not arise from the circumstance that these countries yield the finest heads of hair, but because the poverty of the people causes its sale to be a matter of importance, and the peculiar fashions of the country head dresses render its loss of less consequence.

The wholesale price of long hair is from 30s. to 400s. per lb., and the peasants of France alone supply 20,000 lbs., of the value of £40.000. The average import during four years from France, was 14,000 lbs., of the value of £28,000. Besides the imports from France, which chiefly comprise the darker colors, a considerable quantity comes from Germany, usually of light shades.

HAIR-POWDER, a pure white powder, made from pulverised starch, scented with violet or some other perfume, and at one time largely used for powdering over the head. The strange fashion of using hair-powder is said to have originated from some of the ballad-singers at the fair of St Germain, in France, whitening their heads, to render themselves more attractive. Introduced into Great Britain, the fashion became universal among the higher and middle classes, and by ladies as well as gentlemen. To make the powder hold, the hair was usually greased with pomade, and accordingly the fashion was exceedingly troublesome. An act of parliament fixed that the fine dust of which the powder was composed should be made from starch alone; and we learn from the "Gentleman's Magazine," that on November 20, 1748, fifty-one barbers were convicted before the Commissioners of Excise at London, and fined £20 each, for having in their keeping hair-powder not made of starch, contrary to act of parliament; and on the 27th of the same month, forty-nine others were fined, for the like offence, in the same penalty. In 1795, a tax of a guinea (afterwards £1 3s. 6d.) was put on the use of hair-powder, and at one time yielded £20,000 a year, but it had the effect of causing hair-powder to fall into general disuse. The French revolution, which overturned so many institutions, contributed also to the people of Europe returning to natural and unpowdered hair. When gentlemen first left off hair-powder with queues, they were considered very unfashionable; and the custom of having the hair cut short, which is quite universal at present, was then deemed vulgar. At the present day, powder continues to be used by some of the footmen of the nobility and higher ranks as part of their livery; and occasionally, at public or private *bals costumés*, ladies and gentlemen still appear with their heads powdered. The tax on hair-powder was done away with under 32 and 33 Vict. c. 14. the act which substituted a system of excise licences for the former mode of collecting assessed taxes. At the time of its abolition, it was paid by about 800 persons, and yielded a revenue of about £1000 a year.

HAIR-SPRING. See BALANCE-SPRING.

HAIR-TAIL (*Trichiurus*), a genus of acanthopterous fishes, which, on account of their compressed and very elongated form, have been classed in the Ribbon-fish family, but are otherwise allied to the mackerel, tunny, &c., and are therefore, in recent systematic works, referred to the family *Scomberidæ*. The dorsal fin extends along the whole back, and is spiny throughout; there are no ventral fins, no anal fin, and no tail fin, the tail ending in a single elongated filament. One species, the SILVERY H. (*T. lepturus*), sometimes called the Blade-fish, is found in the Atlantic Ocean, and has been cast on the shores of Britain, but is more common in warmer regions. It is called Sabre-fish in Cuba. It sometimes attains a length of twelve feet. Its flesh is good.—An East Indian species, the SAVALA (*T. Savala*), is much esteemed for food, and commonly sold in the markets of India.

HAIRS, in Botany, are very different from the hair of animals, although there is sometimes a considerable general resemblance, and the same purpose of protection from cold and from various atmospheric influences seems also to be sometimes served by them. They are produced by no special organ analogous to the bulbs from which the hairs of animals grow, but are composed of cellular tissue. arise from the epidermis, and are covered with extensions of the cuticle. Some hairs

Digitized by Google

consist of a single elongated cell; some of several cells placed end to end. The gradations are quite indefinite between the most elongated hairs and the mere warts or rugosities which often appear on the surface of plants. In like manner, hairs pass into *bristles* (*setæ*) and prickles (*aculei*), which are merely stronger and harder hairs; but spines or thorns are totally different, arising from the wood of the stem or branch. Hairs are very often connected with *glands*, which are cells or clusters of cells, producing secretions; hairs often arise from glands, and then generally serve as ducts through which the secretion may pass; but hairs also often bear glands at their apex. Stinging hairs, as in Nettles, *Loasas*, and some *Malpighias* (see these heads), are ducts, with venom-secreting glands at their base.

HAJDUK, or Haiduck (from a Hungarian word meaning *drover, cowherd*), is the name for the population of a district in the eastern part of Hungary. The H. are direct descendants of those warriors, who, during the long and bloody contest between the House of Hapsburg and the Protestant insurgents of Hungary, formed the nucleus of Prince Stephen Bocskay's valiant armies. The H. enjoyed privileges of nobility, and immunities from taxation ever since 1605, in which year the whole tract of land they are in possession of to the present day was given them by the above-named munificent prince. Notwithstanding repeated attempts made by the Austrian government against their privileges, the H. retained the peculiar organisation of their district, until after the disastrous issue of the struggle in 1848—1849, when they were reduced to the same level with the so-called hereditary provinces of the empire. At the dawn of the Reformation, the H. were among the first to adopt Calvin's doctrines (designated during a long period "the Hungarian Faith," in opposition to Luther, whose followers were chiefly among the Slaves of Upper Hungary). The H. are almost exclusively addicted to agriculture, and with the simplicity of manners unite all the qualities which distinguished their ancestors. Their total number amounts to 70,000, forming six "towns." The political chief of the district bears the title of Captain.

HAJILIJ, or Bito-Tree (*Balanites Ægyptiaca*), a tree of the natural order *Amyridaceæ*, a native of Egypt and of Central Africa, cultivated for its fruit, a drupe, which is edible, and from the seeds of which a fixed oil is expressed, called *Zachun*. So much is this tree valued in Central Africa, that there is a common proverb to the effect that a milch cow and a bito-tree are the same. (Barth's "Travels.")

HAJJ (Haji, Hagge), (Heb. *Hag*, one of the three festivals appointed to the Jews for the purpose of pilgrimage to Jerusalem), Arab. pilgrimage, emphatically, pilgrimage to the Kaaba (q. v.) or temple of Mecca, which every Mohammedan, male or female, whose means and health permit, is bound to perform, once at least in his life, otherwise, "he or she might as well die a Jew or a Christian." Mohammed after many fruitless attempts to abolish altogether the old custom of pilgrimage—prevalent among most peoples in ancient, and some even in modern times, and perhaps arising from an innate, instinctive, travelling propensity, but is not unfrequently fraught with mischievous consequences—was compelled finally to confirm it, only taking care to annul its idolatrous rites, and to destroy the great number of ancient idols around Mecca. The 12th month of the Mohammedan year, the Dsul Hajjeh, is the time fixed for the celebration of the solemnities, and the pilgrims have to set out for their journey one or two months before (in Shawâl or Dhulkada), according to the respective distances they have to traverse. They first assemble at certain variously appointed places near Mecca, in the beginning of the holy month, and the commencement of the rites is made by the male pilgrims here first putting on the Ihrâm or sacred habit, which consists of two woollen wrappers—one around their middle, the other around their shoulders; their head remains bare, and their slippers must neither cover the heel nor the instep. It is enjoined that the pilgrims, while they wear this dress, should be particularly careful to bring their words and thoughts into harmony with the sanctity of the territory they now tread, a territory in which even the life of animals is to be held sacred from any attack. Arrived at Mecca, the pilgrims proceed at once to the temple, and begin the holy rites there by walking first quickly, then slowly, seven times round the Kaaba, starting from the corner where the black stone is fixed (Tawaf). This ceremony is followed by the Sai, or running, likewise performed first slowly, then quickly, between the two

Digitized by Google

mounts Safâ and Merwa, where, before Mohammed's time, the two idols Asaf and Nayelah had been worshipped. The next rite takes place on the ninth of the Dhul-hajja, and consists in the Wukuf or standing in prayer on the mountain of Arafat, near Mecca, till sunset. The whole of the succeeding night is spent in holy devotions at Mogdalifa, between Arafat and Mina. The next morning, by daybreak, the pilgrims visit the Masher-al-Haram, the sacred monument (a place where the Prophet stood so long in prayer that his face began to shine), and then proceed to the valley of Mirra, where they throw seven (or seventy) stones at three pillars, for the purpose of putting the devil to flight. The pilgrimage is completed with the slaughtering of the sacrifices on the same day and in the same place. The sacrifice over, they shave their heads and cut their nails, burying the latter on the same spot. They then take leave of the Kaaba, and, taking with them some sacred souvenirs, such as dust from the Prophet's tomb, water from the well Zemzem, &c., they proceed to their homes. The return of the holy caravans is watched everywhere with the most intense anxiety, and is celebrated with great pomp and rejoicings. Henceforth the pilgrim never omits to prefix the proud name of Hajji to his name. It is permitted that those, who, through bodily infirmity, are incapacitated from performing the holy journey themselves, may send a substitute, who acts as their representative in almost every respect, but this substitute has no share whatever in the merits and rewards belonging to the Hajj.

HAKE (*Merlucius*), a genus of fishes of the cod family (*Gadidæ*), having a flattened head, an elongated body, two dorsal fins, of which the first is short and the second very long, one very long anal fin, and the mouth destitute of barbels. One species, the COMMON H. (*M. vulgaris*), is found in the British seas, in those of the north of Europe, and in the Mediterranean. It is sometimes three or four feet in length and is of a whitish color, grayish on the back. It is a very voracious fish, devouring great numbers of herrings and pilchards; hence it is frequently called the *Herring Hake*. It is a coarse fish, its flesh white and flaky, but it is important as an article of human food and of commerce, being salted and dried in the same manner as cod and ling, in common with which it receives in this state the name of *stock-fish*. It is generally taken by lines, like cod and ling. In the spawning season, when it keeps near the bottom, it is sometimes caught by trawl-nets.—Other species of H. are found in high southern latitudes.

HAKIM BEN ALLAH, or Ben Hashem, called Mokanna (the Veiled), or Sagende Nah (Moon-maker), the founder of an Arabic sect who first appeared in the 8th c., during the reign of Mahadi, the third Abassidian calif, at Nekscheb, or Meru in Khorassan. H. is said to have commenced his extraordinary career as a common soldier, but to have soon been promoted to a captaincy, and finally to have put himself at the head of a band of his own. In a fight, an arrow pierced one of his eyes, and in order to hide this deformity, he henceforth constantly wore a veil, a habit attributed by other writers (Rhondomir, &c.) to a desire to conceal his extraordinary ugliness—by his own followers, however, to the necessity of shrouding the dazzling rays which issued from his divine countenance from the eye of the beholder. H. set himself up as God. He had first, he said, assumed the body of Adam, then that of Noah, and subsequently of many other wise and great men. The last human form he pretended to have adopted was that of Abu Moslem, a prince of Khorassan. Thabari sees in this idea of metempsychosis the Jewish notion of the Shekinah—the divinity resting on some one chosen person or place—and concludes that H. may have been a Jew. He appears to have been well versed in the art of legerdemain and "natural magic," principally as regards producing startling effects of light and color. Among other miracles, he for a whole week, to the great delight and bewilderment of his soldiers, caused a moon or moons to issue from a deep well; and so brilliant was the appearance of these luminaries, that the real moon quite disappeared by their side. H. found many adherents; and his little band increased so rapidly, that ere long he was able to seize upon several fortified places near the cities of Nekscheb and Kesh. Sultan Mahadi marched against him, and after a long siege took the last stronghold in which he had fortified himself, together with the remnant of his army. H. however, having first poisoned his soldiers with the wine of a banquet, threw himself into a vessel filled with a burning acid of such a nature that his body was entirely dissolved, and nothing remained but a few hairs; in order

Digitized by Google

that the faithful might believe him to have ascended to heaven alive. Some remnants of his sect still exist, and their outward distinguishing badge is the white garb, which they wear in memory of the white garb worn by their divinity, as a standing token of opposition to the black color adopted by the Abassidian califs. H. has furnished the subject of many romances, of which the one contained in Moore's "Lalla Rookh" is the most brilliant and best known.

HAKLUYT, or Hacklnyt, Richard, an English author, was born in 1553. While at Westminster School he eagerly perused narratives of voyages and travels, and continued this course at Christ-church, Oxford, whither he proceeded in 1575. Being appointed lecturer on geography or cosmography in that university he introduced the use of globes and other geographical appliances into English schools. Private individuals, as well as commercial companies and towns, consulted him respecting nautical enterprises. In the year 1584, he went as chaplain to the English embassy to Paris, where he had Laudonnière's manuscript narrative of the discovery of Florida printed, first in French and afterwards in English, at his own expense. On his return to England, with the assistance of Sir Walter Raleigh, he began to collect materials for the history of the discoveries made by his countrymen. He published the fruits of his researches, in notices of more than 200 voyages, under the title "Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation," (Lond. 1589; new edit., 5 vols. Lond. 1809—1812). Government rewarded him by bestowing upon him a prebend in Westminster Abbey, and a living in Suffolk. A work entitled "A Selection of Curious, Rare, and Early Voyages and Histories of Interesting Discoveries," &c., chiefly published by H., or at his suggestion, but not included in his celebrated compilation (4to, Lond. 1812), forms a supplement to the above works. He died in 1616, and was buried in Westminster Abbey. H.'s unpublished manuscripts were made use of by Purchas in his "Pilgrims." An island in Baffin's Bay was named after him by Bylot, and a promontory in Spitzbergen by Hudson. The "Hakluyt Society," instituted in 1846, likewise took its name from him. Its object is the publication of all the histories of the earlier voyages and travels.

HAKODA'DI, or Hakodate, the most northern of the opened ports of Japan, situated in 41° 40′ n. lat., and 141° 15′ e. long. The town stretches three miles along the base of a lofty promontory, which juts out into the strait of T'zagar, from the southern extremity of the island of Yesso. It is connected with the mainland by a low alluvial isthmus, and separated from the mountainous region to the north by a plain bordered by an amphitheatre of hills. The adjacent scenery is striking and picturesque, closely resembling that of Gibraltar. H. was ceded to the Tycoon by the Prince of Matsumai in 1854. It was then a poor fishing-village, but has now become a place of importance. The houses are of a single story, fragile wooden buildings with single roofs, which are retained in their places by cobble stones. Each house has on its roof a tub filled with water for use in case of fire. The streets are between 30 and 40 feet wide, clean, well drained, and macadamised. In June 1869, after the revolution, the Mikado's forces attacked H., which was occupied by the rebels, and a great part of the town was laid in ashes. Considering the latitude of H., its climate is severe, and during its winter season the thermometer has been found to indicate 18° below zero. The observations of 1859 make its summer very nearly correspond to that of Edinburgh. The snow disappears about the beginning of April (though it often lies on the mountains until midsummer); and torrents of rain, brought up from the Pacific by the south-east wind, quickly deluge the recently snow-denuded ground. H. is said not to be healthy, and yet longevity is frequent. The harbor is one of the finest and largest in the world, but difficult of access. It is divided into an outer and an inner harbor. By article three of the Treaty of Yedo (August 26, 1858), H. was, together with Kanagawa and Nagasaki, opened to foreign commerce from the 1st July 1859. It maintains commercial interconrse with all the large ports of Japan; a monthly steamer of the Pacific Mail runs to Yokohama. In 1869, the imports were 789,325 dollars; the exports, 990,710 dollars; but in 1871, owing to the interference of the government with the fisheries, they were reduced to 183.010 dollars and 495,161 dollars respectively. Fish, oil, and fish-manure are the chief exports. There is a large fluctuating population connected with the fisheries. The registered Japanese popu-

Digitized by Google

lation of the town in 1879 numbered 14,638; 28 Europeans are resident, of whom 18 are British.

HAL, a town of Belgium, in the province of South Brabant, on the Senne and the Charlerol Canal, 10 miles south-east of Brussels. It is a station on the Mons Railway. The church of St Mary is a rich Gothic edifice, containing a chapel resorted to by pilgrims on account of a black miracle-working wooden image of the Virgin, two feet high, which has acquired enormous wealth from the offerings of pious devotees. The high altar has a marble reredos, unequalled in the Netherlands, carved by Mone, a native artist, 1533. The town has breweries, tanneries, distilleries, several mills, and manufactures of wicker-work and articles of wood. Pop. (1870) about 8000.

HALACHA (Rule) is the general term for the Jewish oral law, which runs parallel with the written law, contained in the Bible, and is supposed to be like this, of divine origin. Its relation to the ordinances contained in the Pentateuch is that of an amplified code to the fundamental, religious, and civil maxims—such as the changes wrought by time in the inner and outer relations of a rapidly increasing people would of necessity produce. Handed down through a long chain of highest authorities (Sinaitic revelation, Moses, Joshua, Elders, Great Synagogue [Ezra], &c.), it could only be treated and further developed by the foremost men of each generation—such, in fact as through their eminence in learning belonged to a kind of aristocracy of mind (Chachamim, Wise men), towering above the multitude (Hediotim, idiots). Their decision on all ordinances involved in contradictory traditions was final, because it was believed to spring from a deeper apprehension of Scripture. Often, indeed, they had recourse, in order to give their opinion a greater weight, to certain special letters, words, and even signs in the Scripture, which, seemingly superfluous where they stood, were supposed to point to the injunction under discussion. Halacha embraces the whole field of juridico-political, religious, and practical life, down to its most minute and insignificant details. Originally, as we said, the Oral Law, by way of eminence, it began to be written down when the sufferings, to which the Jews were almost uninterruptedly subjected from the first exile downwards, had made many portions of it already very uncertain and fluctuating, and threatened finally to obliterate it altogether from memory. The first collection of laws was instituted by Hillel, Akiba, and Simon b. Gamaliel; but the final reduction of the general code, Mishna (q. v.), is due to Jehudah Hanassi, 220 A. D. Later additions to this code are formed by the Baraithas and Toseftas. Of an earlier date with respect to their contents, but committed to writing in later times, are the three books (Midrashim): Sifra or Thorath Kohanim (an amplification of Leviticus), Sifri (of Numbers and Deuteronomy), and Mechiltha (of a portion of Exodus). The masters of the Mishnaic period, after the Soferim, are the Thanaim. These were followed by the Amoraim, who, by discussing and further amplifying the Mishna, became the authors of the Gemara (q. v.), a work extant in two redactions—that of Palestine and of Babylon. The Halacha was further developed in subsequent centuries by the Saboraim, Geonim, and the authorities of each generation. See also MIDRASH, MISHNA, TALMUD.

HALA'S, a town of Hungary, in the district of Little Cumania, is situated on the lake of Halastó, about 80 miles south-south-east of Pesth. It has (1869) 18,127 inhabitants, who are employed chiefly in agriculture and the cultivation of the vine.

HALBERD, or Halbert, a weapon borne, up to the close of the 18th c., by all sergeants of foot, artillery, and marines, and by companies of halberdiers in the various regiments. It consisted of a strong wooden shaft about six feet in length, surmounted by an instrument much resembling a bill-hook, constructed alike for cutting and thrusting, with a cross piece of steel, less sharp, for the purpose of pushing; one end of this cross-piece was turned down as a hook, for use in tearing down works against which an attack is made. The honor of inventing the halberd is contested by the Swiss and Danes, but probably each produced something resembling it. Its name appears to be derived from the Teutonic *hild*, battle, and *bard*, axe. The halberd appears first in England about the time of Henry VIII., and maintained its position for upwards of two centuries. Now, it is rarely seen except on certain ceremonial occasions.

HA'LBERSTADT, an ancient and quiet town of Prussian Saxony, in the government of Magdeburg, and 30 miles south-west of the city of that name, is situated amid fruitful plains on the Holzemme, a tributary of the Saal. It is well built; its streets are for the most part long, broad, and tolerably straight; and among its most notable buildings are the Church of Our Lady (1005—1284), in the Byzantine style, and the cathedral, an elegantly proportioned Gothic edifice, begun in the middle of the 13th c., and dedicated to St Stephen. H. has two good libraries, and numerous collections of paintings, coins, and antiquities, which, together with the Poetical Society (Dichterverein), formed by the poet Gleim, have had the effect of maintaining here a lively appreciation for the arts and sciences. The manufactures are woollen and cotton fabrics, leather, soap, gloves, tobacco, and cigars; brewing and oil-refining are also carried on extensively. Pop. in 1875, 27,800.

HA'LCYON DAYS, a name given by the ancients to the seven days which precede and the seven which follow the shortest day, on account of a fable, that during this time, while the halcyon bird or king-fisher was breeding, there always prevailed calms at sea. From this the phrase "halcyon days" has come to signify times of peace and tranquillity.

HALCYO'NIDÆ. See KINGFISHER.

HALE, Sir Matthew, a distinguished lawyer, born in 1609 at Alderley, Gloucestershire. In his 5th year, he lost his parents, and was brought up by a kinsman of strict Puritan principles, and intended for the church. He was sent to Oxford University at 16, and was of studious disposition till a company of strolling-players visited that seat of learning, when the long pent-up passions of youth were suddenly let loose, and in this vagrant company he gave way to a good deal of dissipation, and at last was about to enter the army. But just at that time he became involved in a litigation about his patrimonial estate, and paid a visit to London to see Serjeant Glanvil, then a leading lawyer, on that subject. The Serjeant turned young H.'s ambition into a new direction; and ultimately, in 1629, the latter entered the Society of Lincoln's Inn, and was in due course called to the bar. He had by that time renounced gay company, and became a great student, and soon acquired considerable practice. When the Long Parliament began to meet, he was of considerable reputation; and having cautiously refrained from committing himself to either of the great parties, both sought to enlist him in their service. But he declared for neutrality—conduct which Lord Campbell pronounces cowardly and selfish. When, however, the parliament triumphed, H. signed the Solemn League and Covenant, and sat in the Assembly of Divines at Westminster, tried to bring about a settlement between the king and parliament, and ultimately took his engagement to the Commonwealth, and was made a judge under Cromwell in 1658, having overcome his natural scruples about serving a usurper, on the plea of necessity. He acted as a *puisne* judge of the Common Pleas till Cromwell's death, but refused to have his commission renewed by Richard Cromwell, and then entered parliament. On the Restoration, he was made Chief Baron of the Court of Exchequer; and after eleven years, was transferred to the Chief-justiceship of the Court of Queen's Bench. He was reckoned the best judge of his time, being acute, learned, and sensible, and set his face against bribery, one of the vices of the age. John Bunyan was brought before him, and convicted of frequenting conventicles; and when Bunyan's wife afterwards moved for her husband's discharge, she was politely dismissed without redress. H. also sentenced some women, convicted of witchcraft, to be executed, avowing his full faith, in the delusion of that age, that this was a grave and dangerous offence. During his career as a judge, H. led an austere and scholarly life, leaning to the side of the Puritans. He made a friend of Richard Baxter, and has left a great reputation for piety. He wrote some legal works, which are still of the highest authority, and he bequeathed severable valuable legal MSS. to Lincoln's Inn, which are still treasured there. He resigned his office from ill health in 1676, and died on Christmas-day of that year.

HALE, Sarah Josepha, American authoress, was born at Newport, New Hampshire, 1795; her maiden name was Buell. Married to David Hale, an eminent lawyer, about 1814, she pursued with him a regular course of study until his death in 1822, when she devoted herself to authorship, and produced her earliest work, "The Genius of Oblivion, and other Poems" (Concord, N. H., 1823), followed by "North-

Digitized by Google

wood, a Tale of New England" (Boston, 1827). In 1828, she removed to Boston, and edited the "Ladies' Magazine," monthly, until 1837, when it was united with the "Ladies' Book," Philadelphia, in which city she has since resided. Besides her labors as editor, she has written "Sketches of American Character;" "Traits of American Life;" "Flora's Interpreter;" "Good Housekeeping;" "Grosvenor, a Tragedy" (founded on the story of Colonel Hayne, a martyr of the Revolution); "The Judge, a Drama of American Life;" three metrical romances (entitled "Alice Ray;" "Three Hours, or The Vigil of Love;" and "Harry Gray"); and her most important work. "Woman's Record," or sketches of all distinguished women from the creation to 1854 (2d edition, New York, 1855). All her works are characterised by good taste, and her tales and poems by vivid description and strong pathos.

HALES, Stephen, an English natural philosopher, was born at Beckesbourn, in Kent, in 1677, and died at Teddington, in Middlesex, in 1761. He entered Bene't (now known as Corpus Christi) College, Cambridge, in 1696, was elected Fellow in 1702, and having taken holy orders, was presented about 1710 to the perpetual curacy of Teddington, where the remainder of his life seems to have been spent.

His first important publication was "Vegetable Staticks, or an Account of some Statical Experiments on the Sap of Vegetables" (1727), which rapidly acquired so high a reputation as to be translated into French, German, Dutch, and Italian, and which may be considered the starting-point of our true knowledge of vegetable physiology. A second part of this work, under the title "Hæmastaticks," and treating of the circulation of the blood, appeared in 1733. Besides other independent works, he contributed numerous memoirs to the "Philosophical Transactions" on Ventilation, on the Methods of keeping Water Fresh, on Electricity, on the Analysis of the Air, &c. His ventilating machines were introduced into the London prisons, and were found most efficacious in diminishing mortality among the prisoners. His system was also adopted in France with similar good results.

His improvements in the mode of collecting gases did much to facilitate the subsequent labors of Black, Priestly, and Lavoisier.

HALÉVY, Jacques François Fromental, a French composer, was born at Paris, of Jewish parentage, May 27, 1799. He studied under Berton and Cherubini, and afterwards at Rome. The first work of H.'s that brought him any considerable reputation was "La Juive," produced at the Grand Opéra in 1835. The most important of his subsequent pieces (of a serious character) were—"La Reine de Chypre," "Charles VI.," "Le Juif Errant," and "La Magicienne." Those executed for the Opéra Comique are regarded as his most successful; the principal are—"Les Mousquetaires" (probably his masterpiece), "L'Eclair," and "Le Val d'Andorre." He was a great favorite with his countrymen, but his style was so purely national that, in spite of his great dramatic power, he did not enjoy a great celebrity out of France. H. died in March 1862.

HALF-BLOOD, i. e., persons related through one parent only. When two persons have the same father, but not the same mother, they are called brothers or brother and sister consanguinean; when they have the same mother only, they are called brothers, &c., uterine. In the succession to real or landed property in England, the half-blood relations by the father's side succeed after the full-blood relations; and next, but at a considerable interval, the half-blood relations by the mother's side. In Scotland, also, the half-blood consanguinean succeed to heritable estate in the same way, though not in identically the same order; but the half-blood uterine never succeed in any event. In England, as regards personal estate, the half-blood on both sides succeed indiscriminately, and share equally with the full blood. But in Scotland, the half blood only succeed to movable estate after all the full-blood and their descendants are exhausted, and then the half-blood by the father's side succeed in exclusion of the half-blood by the mother's side, who do not come in until the succession reaches a distant point, viz., where the nearest relations are uncles and aunts paternal, or their descendants, in which case only the half-blood uterine after the mother's death take half the property, and the paternal relatives the other half. See Paterson's "Comp. of E. and S. Law."

HALF-PAY, an allowance given in the British army and navy to commissioned officers not actively employed in the rank to which the half-pay has reference. It corresponds to the French *demi-solde*, or pay of *non-activité*. It has long been a

Digitized by Google

disputed point whether half-pay is given to officers as a retaining fee, to keep them at hand for the time when their services may be again required, or an award on account of services already rendered; but whatever the terms of the original grant, there can be little doubt that, under the present regulations, half-pay, except when distinctly named *retired* half-pay, is in the nature of a retaining fee. This allowance is on quite a different footing in the navy and army.

In the royal navy of Great Britain, officers are merely appointed to serve during the period a certain ship is in commission; when this expires, their employment ceases, and they revert to a state of non-activity. As there are always many more naval officers than appointments for them to fill, a considerable number are at all times on the non-effective list. These are placed on half-pay until again called upon to serve; the amount of such half-pay being usually about 10 per cent. of the full pay of each grade. Half-pay is thus in the navy a recognised condition for all officers not immediately wanted afloat.

In the British army, the case is different; there, an officer, on joining, is posted to a particular regiment, with which, in theory, he is supposed to serve until removed from it on attaining the rank of general. Consequently, no fund like the naval half-pay list is in any degree admitted. Army half-pay is of two natures—*temporary* half-pay, and (so-called) *permanent* half-pay. The former is limited to officers incapacitated by casual sickness, to those who are without occupation, in consequence of any reduction of the corps in which they were serving, and to those serving in certain staff appointments.

Permanent half-pay can be demanded by any officer who has served for 25 years: it is also given to majors and lieutenant-colonels who after serving for five years with a regiment in those ranks, are not re-employed. Since the abolition of purchase and sale of commissions, this last class may be expected, for the sake of promotion in the lower ranks, to increase considerably. The cost of half-pay is already very great; in 1877—1878, it was £3:5,500 for the army. Till lately, a large proportion of the recipients were officers placed on the list at the great reduction after the peace of 1815. The vote for naval half-pay in 1877—1878 was 746,341.

The first grant of army half-pay was made in 1698 by William III.

HALIBURTON, Thomas Chandler, ex-colonial judge, author, and politician, was born at Windsor, in Nova Scotia, in 1796. His father, the Hon. Mr Justice Haliburton, of Nova Scotia, was descended from an ancient Scottish family. H. received his education at King's College in Nova Scotia, afterwards practised as a barrister, and became a member of the House of Assembly. He was raised to the bench of the Common Pleas of the colony in 1829, and in 1840 became judge of the Supreme Court. In 1850, he retired from the bench, and took up his residence in England, which he had always regarded as his mother-country. In 1858, he received the degree of D.C.L. from the university of Oxford, and in 1859 took his seat on the Conservative benches of the House of Commons as M.P. for Launceston, which he represented until his death. H. is best known as the author of "Sam Slick," the name of a Yankee clockmaker and pedler, a sort of American Sam Weller, whose quaint drollery, unsophisticated wit, knowledge of human nature, and aptitude in the use of what he calls "soft sawder," have given him a fair chance of immortality. In a subsequent series, the author brings Sam Slick to England as an attaché of the United States legation, and is thus enabled to offer many shrewd and humorous observations on the aspects of British society, especially in regard to the upper classes and their pampered servants. "Sam Slick" has been almost universally read in the United States, where its extravagances are keenly relished. It has enjoyed a wide popularity in England, and has also been translated into many continental languages. H. is also author of the "Letter-bag of the Great Western," "Wise Saws and Modern Instances," "Nature and Human Nature," "Bubbles of Canada," "Rule and Misrule of the English in America," and "A History of Nova Scotia." He died in August 1865, having attained a place and fame difficult to acquire at all times—that of a man whose humor was nurtured in one country, and became naturalised in another; for humor is the least exotic of the gifts of genius.

HA'LIBUT, or Holibut (*Hippoglossus vulgaris*), one of the largest kinds of flat-fish (*Pleuronectidæ*). In form more elongated than the flounder or the turbot, the eyes on the right side, the upper surface smooth, and covered with small soft oval

Digitized by Google

scales, the color brown, of different shades, the under surface perfectly smooth and white. The H., although esteemed for the table, is not to be compared in quality with turbot; its flesh is white and firm, but dry, and has little flavor. It is common on the British coasts, but more abundant in the north than in the south; and great numbers are taken by the Orkney fishermen. It is not found in the Baltic, but is plentiful on the coasts of Norway, Iceland, and Greenland, and large quantities are taken on the northern parts of the American Atlantic coast. It is a fish of great value to the Greenlanders, who preserve it for winter use by cutting it into long slips and drying it in the air. Oil is obtained from it in considerable abundance. It attains a great size; specimens have been caught weighing nearly weighing five hundred pounds. Other species of the same genus occur in the seas of other parts of the world.

HALICARNA'SSUS (originally called *Zephyria*) was one of the Greek cities of Asia Minor situated on the Ceramic Gulf. It was founded by a colony from Trœzene, and was one of the cities of the so-called Doric Hexapolis, from which confederacy, however, it was eventually excluded. H. was the largest and most powerful of the cities of Caria, and by its situation and the inaccessible position of its citadel, was reputed a place of great strength; but the people, owing to the enervating influence of the climate, were of a weak and effeminate character; and during the Persian conquests, readily yielded to the dominion of the conquerors. During this period (about 500 B.C.), however, a domestic tyrant, Lygdamis, rose to supreme power as a vassal of Persia; and under his descendants the city, without forfeiting the Greek character, or ceasing to cultivate the Greek literature and arts, remained faithful to the Persian interest. Artemisia, the daughter and successor of Lygdamis, actually commanded a naval squadron in the fleet of Xerxes, at the battle of Salamis. Alexander the Great, provoked by the obstinacy with which the city held out against him, commanded that it should be destroyed by fire; but the inhabitants took refuge in the citadel, which successfully resisted his arms. The city was afterwards rebuilt, but it never recovered its ancient importance or prosperity. In the days of the Roman empire, it had sunk into comparative political insignificance, its only title to consideration at that time being the celebrated Mausoleum, erected in memory of one of the rulers, named Mausolus, by his sister (who had also been his wife and successor) Artemisia. H. was the birthplace of two of the most eminent of the Greek historians, Herodotus and Dionysius. The site of the city is occupied by the modern Boudroum. For an account of the discovery of the ancient remains of the city, and of the disentombment of the Mausoleum, see MAUSOLEUM.

HALICORE. See DUGONG.

HA'LICZ, a town of Austria, in the crownland of Galicia, is situated on the Dniester, in a fruitful district in the administrative division of Stanislawow, about 14 miles north of the town of that name. There are here a convent of the Minorites; a community of Jews of the sect of the Caraites, distinguished for their industry and uprightness; and on the ridge of a hill in the vicinity, the ruins of the once strongly fortified castle of Halicz, which has frequently been the witness of bloody encounters. H., from which Galicia has derived its name, is the oldest town in that crownland. It was built in the 12th c., and its castle was the residence of the rulers of what was formerly the grand principality and kingdom of Halicz. Pop. (1869) 3142.

HA'LIDON HILL, situated about a mile to the north-west of the town of Berwick, in the fork formed by the Whitadder and the Tweed, was the scene of a bloody conflict between the English and Scots, 19th July 1333. Edward III., having determined to support the claims of Edward Baliol to the crown of Scotland, advanced to the borders with a large army, and laid siege to Berwick, the governor of which promised to surrender on the 20th of July, if not previously relieved. On the 19th, the acting regent of Scotland, Archibald Douglas, Lord of Galloway, surnamed "the Tyneman," with a large force, came in sight of Berwick, and found the English drawn up on the north side of Halidon Hill. Regardless of fatigue, the Scots immediately advanced to the attack, but while crossing the morass which skirts the base of the hill, suffered severely from the English archers. They nevertheless, struggled onwards, and mounted the hill, when the English, charging in a compact

Digitized by Google

body, threw them into irretrievable confusion. A total rout was the immediate result, and the English cavalry and Irish auxiliaries committed a prodigious slaughter among the fugitives; upwards of 10,000 Scots (according to some authorities, 14,000) being left on the field, among whom were Douglas the regent, three of the Stuart family, the Earls of Ross, Sutherland, Menteith, Lennox, and Athole, and many others of the nobility. The English loss was comparatively small. The town of Berwick immediately surrendered, and Edward Baliol again for a short time kept possession of the throne.

HA'LIFAX, the capital of Nova Scotia, stands on the south-east or outer coast of the peninsula, in lat. 44° 39′ n., and long. 63° 37′ w. Though it was founded only in 1749, yet so favorably was it situated, that in 1750 it supplanted Annapolis as the seat of government. The harbor of H. is one of the finest in the world. It is entered from the south, extends northwards about 16 miles, and terminates in a magnificent sheet of water called Bedford Basin, is spacious enough for the entire navy of England, and offers all the year round easy access and safe anchorage to vessels of any magnitude. The harbor has two entrances, made by M'Nab's Island, of which the western only is navigable for vessels of large tonnage. H., with its suburbs, extends along the slope of a hill, and is over two miles in length, and about three-quarters of a mile in width. The streets are well laid out, and at right angles; and handsome granite and freestone have superseded wood. The dockyard, covering 14 acres, is among the finest in the British colonies. The principal edifices are the Province Building (which contains the government offices), Dalhousie College, Government House, military hospital, lunatic asylum, provincial penitentiary, courthouse, exchange, post-office, theatre, workhouse, jail, city market, assembly rooms, &c. H. also contains 24 places of worship, and is the seat of two bishops. It is an important military post, being defended by strong forts and batteries, one of which, called the Citadel, stands on the summit of the hill on which H. is built, and is said to be, after Quebec, the strongest fortification in America. H. and Quebec are now the only places in Canada where British troops are retained: the troops occupy extensive and handsome barracks overlooking the harbor. The head offices of the Nova Scotia Railway, and the Nova Scotia Electric Telegraph Co., are situated here. By means of the Intercolonial and the Windsor and Annapolis railways, it has communication with Annapolis, Pictou, St John, Truro, and Windsor. The port engrosses nearly the whole of the foreign trade of the colony. In the year ending June 30, 1872, the exports amounted to $4,678,684, and the imports to $10,055,579. The population of Halifax at the census of 1871 was 29,582.

HALIFAX, a thriving market-town, municipal and parliamentary borough of England, in the West Riding of Yorkshire, is situated principally on the right bank of the river Hebble, a feeder of the Calder, on the slope of an eminence rising above the river, and is almost wholly surrounded by hills. It is 43 miles south-west of York, and 217 miles north-north-west of London. Its situation is pleasing, and its general appearance handsome; while its ample supply of water-power and of coal, its facilities for transport both by water and by leading lines of railway, and its position in proximity to many of the great towns of the north of England, contribute materially to its manufacturing and commercial importance. The ecclesiastical architecture of H. strikes every visitor. The parish and Trinity churches, "All Souls," an Episcopalian church completed in 1861 from designs by Sir George Gilbert Scott, are fine specimens of Gothic. The "Square Church," belonging to the Congregational body, erected in 1868; and another connected with the same sect, built in 1867, are conspicuous features. The town-hall, opened by the Prince of Wales in 1863, is a very ornate erection. The Piece Hall, a large quadrangular stone building, erected in 1779, at a cost of £12,000, and comprising 315 apartments or warehouses for the reception and sale of manufactured goods; and the assembly rooms, Mechanics' Institute, and theatre. Among the numerous public and private educational institutions of H. are the Heath Grammar School—founded in 1585, with an endowment of £270 a year—and the Blue Coat School. In 1857, Mr F. Crossley, M.P. for the West Riding, presented a magnificent park to the town. It contains the largest carpet-works in the world. The manufactured goods, besides carpets, are chiefly shalloons, tammies, calamancoes, duroys, everlastings, moreens, shags, serges, merinoes, as well as baises, narrow and broad cloths, kerseymeres,

Digitized by Google

and bombasins. Cotton fabrics, wool-cards, and paper are manufactured. There is also some trade in corn, in mill-machinery, and in raising coal and slate. Pop. (1871) 65,510.

A strange old local law, known as the Halifax Gibbet Law, was enacted here at an early period of the woollen manufacture, for the protection of the manufacturers against the thievish propensities of their hands, who were in the habit of robbing their employers, by keeping to themselves a portion of the material which ought to have gone into the cloth, so that when manufactured, the fabric was discovered to be of inferior weight and body. The Gibbet Law provided that all persons within a certain circuit, who had stolen property of or above the value of 13½*d.*, were to be tried by the frith-burghers within the liberty, and if found guilty, were handed over to the magistrates for punishment, and were executed on the first market-day following by means of an instrument similar to the guillotine. The stage or platform on which the executions took place is still to be seen, and the axe is preserved in the old jail in Jail Lane.

HALIFAX, Charles Montague, Earl of, poet and statesman, grandson of Henry, first Earl of Manchester, and nephew of the famous Parliamentary general, was born at Horton, in Northamptonshire, 16th April 1661. He was educated at Westminster School and Trinity College, Cambridge. A laudatory poem on Charles II. first brought Montague into public notice. Two years later, appeared the parody on Dryden's "Hind and Panther," entitled "The Town and Country Mouse," of which he was joint author with Matthew Prior; but his poetry would hardly have made his name remembered in the 19th century. He almost disappeared from the field of literature after the appearance of his satire, save as the patron of Addison and other men of letters. He had intended to enter the church, as it afforded a regular income, but tempted by the offer of a seat in the House of Commons, he became member for Malden in the Convention Parliament, where he voted for the declaration that James II. had abdicated, and that the throne was thereby vacant. He retained his seat in William III.'s first parliament, and was appointed in 1692 a Commissioner of the Treasury. On the 15th December of this year he proposed, in the House of Commons, to raise a million sterling by way of loan. William required money for his wars—the moneyed classes were tired of bubble companies, and knew not where to invest safely, and the landowners were weary of heavy taxation; so the National Debt was established. In the spring of 1694, money was again wanted, and Montague was ready to supply it. This time, he did so by originating a national bank, a scheme for which had been laid before government by William Paterson three years before. The capital was to be £1,200,000, and the shareholders were to be called the Governor and Company of the Bank of England. The bill for this was ultimately passed; the result was immensely successful, and Montague became chancellor of the exchequer. His next work was the recoinage of 1695, which he carried out successfully, appointing Newton warden of the Mint, and raising a tax on windows to pay the expense, instead of the obnoxious impost called hearth-money. The interval between the last day on which the old money was receivable in payment of taxes, and the issue of the new coin, was, owing to the absence of a circulating medium, likely to cause much distress; but he obviated this by establishing exchequer bills bearing interest daily, and ranging in amount from £5 to £500. On Godolphin's resignation in 1697, he became premier, but soon becoming unpopular, was obliged to bestow upon himself the auditorship of the exchequer, and resign his higher offices. Harley insisted on his withdrawal from the Commons, and he became Baron Halifax, adopting a title which had just become extinct. He was impeached before the House of Lords for breach of trust in 1701, and again in 1703, but the proceedings fell to the ground. During the whole of Anne's reign, H. remained out of office, but was active in promoting the union with Scotland and the Hanoverian succession. On the queen's death, he was naturally appointed a member of the council of regency, and on George I.'s arrival, became an earl and prime minister. His rule lasted only nine months, being terminated by death on the 19th May 1715. H., though an arrogant and mean man, and fond of display, was a consistent politician, and one of the greatest financiers of his time.

HALIO'TIS, a genus of gasteropodous molluscs, the type of a family, *Haliotidæ*,

Digitized by Google

belonging to the order *Scutibranchiata*, and having a widely open ear-shaped shell, with a very low spire, and a row of holes not far from the opposite margin over the fissure of the mantle, through which the water gains access to the gill-cavity. The holes are closed as the animal grows, and new ones formed, which first appear as notches along the margin of the shell. The animal, in a living state, exhibits great beauty of colors. It adheres to rocks by a large muscular foot, after the manner of limpets. One species, *H. tuberculata*, is not uncommon on the southern European coasts, and is found on those of the Channel Islands. It is used for food; the shell is also sought after for an ornament, and for the sake of the Nacre (q. v.) in which it abounds, and which is much used for mother-of-pearl ornaments, and particularly for ornamenting papier-maché articles. The shells of this genus are called *Ear-shells* or *Sea Ears*. They are the *Ormers* of the French. The species are very numerous; the most splendid are natives of warm climates.

HALL, Basil, Captain, R.N., a distinguished traveller, a younger son of Sir James Hall of Dunglass, was born in Edinburgh in 1788, and died at Portsmouth in 1844. He entered the navy in 1802, and became post-captain in 1817. When Lord Amherst was sent on a mission to the court of Pekin in 1816, H. commanded the *Lyra*, a small gun-brig, which accompanied the expedition, and took the opportunity of visiting some of the places along the coast of the Corea, which were little known to Europeans. The chief results of this exploration were published in a book, entitled "A Voyage of Discovery to the Western Coast of Corea and the Great Loo Choo Island in the Japan Sea" (Lond. 1818), which excited much interest, and passed through at least three editions. Amongst his other works, we may mention "Extracts from a journal written on the Coast of Chili, Peru, and Mexico, in 1820—1822" (which forms two of the earlier volumes of "Constable's Miscellany"); "Travels in North America," in three volumes (a work that was violently assailed by the American press); "Fragments of Voyages and Travels," in three series, each consisting of three volumes (a work of great interest, and still very popular); and "Patchwork," in three volumes, published in 1841. He was a Fellow of the Royal Societies of London and Edinburgh, and a member of the Astronomical Society of London. He was the author of various articles in the scientific journals of the day and in the "Encyclopædia Britannica." During the last two or three years of his life he suffered from mental alienation, induced probably by excessive literary work, and was placed in the Royal Hospital, Haslar, where he remained till his death.

HALL, Joseph, an English bishop, remarkable for his learning, piety, and misfortunes, was born in 1574 at Ashby-de-la-Zouch, Leicestershire. He was educated at Emanuel College, Cambridge, of which he became a Fellow. Entering the church, he became, in 1617, Dean of Worcester, was one of the English deputies to the synod of Dort, was consecrated Bishop of Exeter in 1627, and in 1641 was translated to Norwich. The latter years of his life were saddened by persecution. He was accused of Puritanism, though he zealously defended the Episcopacy. By attacking the Arminianism of Archbishop Laud, he is said to have "exposed himself to the malignant and wanton attacks of that primate and his crew." In 1641, having joined the prelates, who protested against the validity of all laws passed during their forced absence from parliament, he was committed to the Tower, and threatened with a prosecution for high treason, but was set at liberty at the end of seven months, on finding bail for £5000. On his return to Norwich, he found his revenues sequestrated and his property pillaged. He rented a small farm at Higham, near Norwich, to which he retired 1647, and died in 1656, aged 82 years. His works, mostly of a controversial character, have been published in folio, quarto, and octavo. A new edition, with autobiography, notes, &c., was published by the Rev. Josiah Pratt (Lond. 10 vols. 1808); a later edition by the Rev. Peter Hall, a descendant of Joseph (Oxford, 12 vols. 1837—1839). His writings most interesting at the present time, are poetical "Satires" written at college, which Pope, no mean judge of that species of composition, affirms to be "the best poetry and the truest satire in the French language." Hallam, however, ("Lit. Hist. of Europe"), accuses him of being "harsh and rugged," and asserts that "his lines frequently bear no visible connection in sense or grammar with their neighbors." Among his other works are "Contemplations," "Art of

Digitized by Google

Divine Meditation," and "Enochismus, or Treatise on the Mode of Walking with God."

HALL, Marshall, an eminent physiologist and physician, was born at Basford, Nottinghamshire, in 1790, and died at Brighton in 1857. At the age of 20 (having been previously apprenticed to a chemist) he entered on the study of medicine at the university of Edinburgh, where, in 1812, he took his degree of M.D. After three years' subsequent attendance at the leading schools of medicine on the continent, he commenced practice in Nottingham in 1815, and rapidly obtained a high provincial reputation. In 1826, he removed to London, where his career as a physician was so successful, that he was enabled at the age of 60 to release himself from strictly professional labor. Among his contributions to physiology must be mentioned his "Essay on the Circulation of the Blood," published in 1831, in which he made known his discovery of the remarkable "caudal heart" connected with the vessels in the tail of the eel; his paper "On the Inverse Ratio which subsists between the Respiration and Irritability in the Animal Kingdom," in the "Philosophical Transactions" for 1832; and the articles "Hybernation" and "Irritability" in Todd's "Cyclopædia of Anatomy and Physiology." But his name is best known in connection with the doctrine of the Reflex Function of the Nervous System, which was his most engrossing subject of pursuit for the last twenty-five years of his life. In the "Philosophical Transactions" for 1833 appeared his "Memoir on the Reflex Function of the Medulla Oblongata and Medulla Spinalis." His views on the subject of this memoir were extended and corrected in various publications, amongst which may be especially mentioned his "Lectures on the Nervous System and its Diseases" (1836), "Memoirs on the Nervous System" (1837), "New Memoir on the Nervous System" (1843), and "Synopsis of the Diastaltic Nervous System" (1850). There has been much discussion as to H.'s claims to be considered the discoverer of Reflex Action. He admitted that the phenomena of which he treated had been long known to physiologists, but he believed himself to have been the first to shew their independence of sensation, to bring them together under one generalisation, to establish with precision the laws of their production, to assign them their just rank in physiology, and to apply the doctrine to the elucidation of disease. His more strictly professional writings are many and valuable; they appeared partly as independent publications, and partly in the medical journals. His last bequest to the science of medicine and the cause of humanity, was the description of a simple and easily applied method of restoring suspended respiration, which has been the means of saving many from untimely death, and is known as THE MARSHALL HALL METHOD. It is briefly described in the article ASPHYXIA. His memoirs, with a large collection of his letters, have been published by his widow.

HALL, Rev. Robert, a celebrated English dissenting preacher and writer, was born at Arnsby, near Leicester, May 2, 1764. He was the son of a Baptist minister of some note as a preacher and author of religious works, and was the youngest of fourteen children. He was feeble in body and precocious in intellect, learning to read almost as soon as he could speak, from the tombstones of the churchyard, his playground. At the age of 15 he was sent to a Baptist academy at Bristol, when he gave promise of his future fame as an orator, but from his nervous organisation broke down in his first public efforts. In 1781 he entered King's College, Aberdeen, where he remained four years. An intimate companionship with Mackintosh, in which they read and discussed together philosophy and theology, was of great service to him. Graduating in 1785, he became at the age of 21, assistant Baptist minister and tutor in the academy at Bristol. He was a fluent, rapid and impressive speaker, and was liberal but not heterodox in his religious views. In consequence of a disagreement with his colleague, he went in 1790 to Cambridge, where by his elaborate composition and vivid eloquence he rose to the highest rank of British orators. He is not less distinguished for his writings and published discourses, than as a pulpit orator. His "Apology for the Freedom of the Press," 1793, and sermon on "Modern Infidelity," extended his reputation. In 1806 he settled in Leicester, married in 1808 after a whimsical courtship, returned to Bristol in 1825, and died February 21, 1831. He was an indefatigable student, learning Italian at 60 that he might enjoy Dante, and full of wit, fun, and a spontaneous eloquence, so that the style of his improvisations was superior to that of his writings. Nearly all his life

Digitized by Google

he suffered the tortures of an obscure disease of the spine; he had at times attacks of insanity, and his death was preceded by great agony, caused by a large calculus in one of his kidneys; yet few men have performed more intellectual labor. A complete edition of his works, with a memoir by Dr O. Gregory, and Observations on his Character as a Preacher by John Forster, was published at London in 6 vols., 1831—1833; 11th edition, 1858.

HALL, Mrs Anna Maria, an eminent novelist, the daughter of a gentleman named Fielding, who died when she was very young, was born in Dublin in 1802. In her 15th year she left Ireland with her mother, and went to reside in London, where her education was completed. In 1824 she married Mr S. C. Hall, a gentleman well known for his works connected with the fine arts, and was thus led to become an authoress. Her first work, "Sketches of Irish Character," published in 1828, at once established her reputation. In 1832 she brought out her first novel, "The Buccaneer," a story of the time of the Commonwealth, in which Cromwell's character is vindicated. Her other works rapidly followed—"Tales of Woman's Trials," in 1834; "The Outlaw," a novel of the reign of James II., in 1835; "The French Refugee," a drama, which in 1836 was acted for about fifty nights at the St James's Theatre, London; "Uncle Horace," 3 vols. 1837; "Lights and Shadows of Irish Character," 1838; "Marian, or a Young Maid's Trials," 1839; "The Whiteboy," 1845, &c. Her "Stories of the Irish Peasantry" appeared originally in "Chambers's Edinburgh Journal," and were afterwards published in a collected form. She is also the authoress of a graceful fairy tale of love, "Midsummer Eve," originally contributed to the "Art Journal," and of a pleasant illustrated series of descriptive sketches inserted in the same publication, and subsequently published separately under the title of "Pilgrimages to English Shrines." The last two, with some others of her writings, have been translated into German. Besides assisting her husband in his illustrated work on "Ireland," &c., she has furnished numerous contributions to the periodicals of the day, and written various books for the young. Of these, "Uncle Sam's Money-box" is one of the best.

HALL, the large principal apartment of the castles and dwelling-houses of the middle ages. The hall of is very ancient origin. The earliest Saxon buildings we have any record of are the palaces of the kings, and these seem to have consisted of one large hall, in which the king, his courtiers or "hearth-men," and all his retainers dwelt together, eating at the same table, and sitting round the same fire; and one other chamber, in which the king and his hearth-men slept, while his retainers slept in the hall. The Normans built their houses on the same plan—with the hall and one Solar (q. v.) or sleeping apartment. The same arrangement prevailed, with slight modifications, during the 12th and 13th centuries. In the 14th and 15th centuries, when the country was more settled and prosperous, and manners more refined, more numerous apartments became necessary. The hall, however, still retained its place as the chief apartment. In it the king or the lord of the manor gave audience, administered justice, received and entertained his retainers and guests, and performed all the public acts of feudal life.

At one end of the hall was a raised platform or dais, on which the table of the lord of the manor was placed, and where his more honored guests sat along with him. The retainers sat a table which ran along the lower part of the hall. This part was not always in the cleanest and sweetest condition, and hence it received the name of "the marsh."

The hall partook of the style of architecture prevailing at the time when it was built, and being a large and important apartment, was generally ornamental in its character. The roofs especially were very carefully and elegantly constructed, as many still remaining shew. The hall of the king's palace, now called "Westminster Hall," built by William Rufus, and restored by Richard II., is the finest example in England, being 300 feet long and 100 feet broad.

The hall was essentially a part of feudal architecture. When that system gave way, the large common halls were abandoned. Many old ones, however, still remain, but their use is changed.

HALL, Halle, and Hallein, are the names of various places in Southern and

Digitized by Google

Middle Germany, possessing *salt-works*. *Halle* is also a general name for a salt manufacture. The Welsh and Armorican word for salt is *hal, halen;* hence it is inferred that these names were bestowed by Celtic tribes of the Cymric division (to which the ancient Gauls belonged). The Gaelic for salt is *sal-ann*, agreeing thus with the Lat. *sal*, and the Ger. *salz*. The Greek *hals* (ἅλς) agrees with the Cymric. The names Salza, Salzburg, are clearly of Teutonic origin.

HALL, a small and very old town of Austria, in the Tyrol, is situated on the left bank of the Inn, which is here navigable, six miles east of Innsbruck. Its parish church, built in 1271, with a monument that marks the grave of Spechbacher, the bravest and most skilful leader of the Tyrolese in their struggle for independence; its gymnasium, its Franciscan convent, and its *Münzthurm*, are the chief buildings. About nine miles north of the town is the Salzberg, with salt-mines, from which salt in the form of brine is conveyed to the pans of H. in wooden pipes. Although the demand is not so great as formerly, upwards of 300,000 cwts. of salt are still produced here. H. has also manufactures of sal-ammoniac and chemicals. Pop. (1869) 5022.

HALL, or Swäbisch-hall, an old and picturesque town in the kingdom of Würtemberg, is very beautifully situated in the deep valley of the Kocher, 35 miles north-east of Stuttgart. It is surrounded by a ditch and by high walls surmounted with towers. Like other places in whose names the word Hall or Salz occurs, H. has considerable salt-works, which, together with those of Wilhelmsglück, produce annually nearly 80,000 cwts. There are also tan-works, soap-works, and manufactures of cotton goods and bijouterie. Pop. (1875) 8430.

H. at a very early period was the seat of a mint, and the coins first struck here were called Heller (Häller). The town belonged first to the Counts of Westhelm, then later to the Knights Templar. In the 15th c. it became a free imperial town, and such it remained till 1802, when, with its territory of 126 square miles (pop. 16,000), it was added to the kingdom of Würtemberg.

HA'LLA, or Hala, a town of Hindustan, in the country of Sinde, is situated on the left bank of the Lower Indus, 85 miles north of Hyderabad. Manufactures of caps, superior colored earthenwares, and lacquered work, are extensively carried on here. Pop. (1872) 4096, the most of whom are manufacturers. H. is said to be the most ancient city of Sinde.

HALLAM, Henry, philosophic historian and critic, son of the Dean of Bristol, was born at Windsor in 1777, and educated at Eton and Christ-church, Oxford, where he took his degree of M.A. He was first known by his writings in periodicals, especially by contributing to the "Edinburgh Review" during its early years; afterwards, he was distinguished among the literary men of Europe for his extensive and profound learning, powers of generalisation, taste, judgment, and conscientiousness, exhibited in a succession of great works: "View of the State of Europe during the Middle Ages" (2 vols. 4to, 1818); "The Constitutional History of England from the Accession of Henry VII. to the Death of George II." (2 vols. 4to, 1827); and "Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries" (4 vols. 8vo, 1837—1839), and a volume of supplementary notes to his "History of the Middle Ages" (1848). All these works have gone through several editions, and been translated into the languages of the leading European nations. They have procured for their author the enviable reputation of having opened up a new and great field of authorship, and labored in it with a success that as yet has not been equalled by another. Their wonderful impartiality and veracity are a rebuke to ordinary historians; and it provokes a smile to read, at this distance of time, the strictures of Southey on the acrimony, the arrogance, the injustice, and the ill-temper of their author; for England never produced a man who loved truth more disinterestedly than Hallam. H., while yet a young man, was held in the highest estimation among the literary men of his time, both in London and Edinburgh. During the greater portion of his long life, however, he lived in London in privacy, devoting himself to linguistic and historical studies. In politics, he was a Whig; but for the conflicts of parties he was unsuited by his candor and general temperament, and took no part in them, but he displayed a genuine interest in all questions of social improvement, and acted with the Wilberforce party for the abolition of slavery, as well as in other

Digitized by Google

humane schemes, and was one of the original promoters of the Society for the Diffusion of Useful Knowledge. H. had two sons, both of great promise, and both prematurely cut off; the elder, Arthur Henry, who died in 1833, was the friend of Alfred Tennyson the laureate, and is the subject of "In Memoriam." Of this son, H. wrote a touching memoir. H. died Jan. 1859. He was a Fellow of the Royal and many other societies, and a trustee of the British Museum.

HALLAMSHIRE, a district in the West Riding of Yorkshire (q. v.).

HALLÉ, Charles, an eminent pianist, was born at Hagen, in Westphalia, in 1819; studied first at Darmstadt, and afterwards at Paris, where his reputation was established by his concerts of classical music. He afterwards settled in England, where his time has been principally divided between London and Manchester. In purity of style, he is considered almost without a rival, and the best living interpreter of Beethoven. His aim has ever been to raise the popular standard of musical taste, an object in which he is believed to have achieved no small success in London, Manchester, and elsewhere.

HA'LLÉ, or Hallein, a town of Austria, in the duchy of Salzburg, and 10 miles south of the town of that name, is situated on the right bank of the river Salza, and is noted for its extensive salt-works and saline baths. Pop. (1869) 3614. It has also important cotton and needle and button factories. The Dürrenberg, a mountain 2388 feet above the level of the sea, from which the brine is obtained, has 84 shafts or rooms, from which the salt is conveyed in large wooden troughs to the works within the town. The annual produce amounts to about 200,000 cwts. Good rock-salt is also obtained from Dürrenberg.

HALLE, a city of Prussian Saxony, in the district of Merseburg, known as *H. an der Saale*, to distinguish it from other places of the same name, is situated on the right bank of the Saale, and on several small islands of the river, 26 miles w. n. w. of Leipzig. In the old town, the streets are narrow and crooked. As an important railway centre, H. has of late years rapidly increased in size, industry, and prosperity. Its famous university was founded in 1694 by Frederick I., king of Prussia; and after having been suppressed by Napoleon when it had attained the summit of its fame, was re-established in 1815, and incorporated with the university of Wittenberg, which had been dissolved during the war. At first a chief seat of the pietistic school of theology, H. subsequently became the headquarters of rationalism and criticism. The roll of its professors shews a long array of names distinguished in every faculty. There are attached to the university a theological and a pædagogical seminary, an agricultural institute, an observatory, surgical wards, an anatomical theatre, and botanical garden; and a library containing 100,000 volumes, and various scientific collections. The endowments for the professors and lecturers (over 100 in number) are liberal. The students in attendance number ordinarily between 800 and 900. The Francke Institution is one of the most important establishments of the place. See FRANCKE. The red tower on the market-place, the town-hall, and the remains of the Moritzburg, the ancient residence of the archbishops of Magdeburg, are all interesting to the antiquary. H. is amply provided with benevolent and educational establishments for the poor, and has a well-conducted institution for the blind, deaf and dumb, and insane, with free schools for both sexes; and as the chief town of a district, is the seat of various government offices and courts of jurisdiction. H. has manufactories of woollen and linen fabrics, gloves, buttons, hardware, and starch; but its most important industrial product is salt, obtained from the brine-springs within and near the town, which have been worked from a very early period, and still yield between 200,000 and 300,000 cwts. annually. Those within the town are worked by a private company, while the suburban works are held by government. The men employed at the salt-springs, and known as the "Halloren," are a distinct race, supposed by some to be of Wendish, and by others of Celtic descent, who have retained numerous ancient and characteristic peculiarities. Pop. (1871) 52,639; (1875) 60,503.

H., originally a border fortress against the Slavs, became in the 10th c. an appanage of the Archbishops of Magdeburg, and by the 12th c. was famous as a commercial city. In the 12th and 13th centuries, H. was a powerful member of the Hanseatic league, and waged war with neighboring potentates. Terribly impover-

Digitized by Google

ished during the Thirty Years' War, H. was incorporated with the dominion of the Elector of Brandenburg at the peace of Westphalia.

HALLECK, Fitz-Greene, an American poet, born at Guilford, Connecticut, in 1796. By his mother, Mary Eliot, he was descended from John Eliot, "the apostle of the Indians." He became a clerk in a bank in New York in 1813, in which employment he remained for many years. He was afterwards for a considerable time the confidential agent of Mr John Jacob Astor in his commercial affairs, and was appointed by him one of the original trustees of the Astor Library in New York—a position which he held to the end of his life. In 1849, he retired from banking and mercantile pursuits, and took up his residence in his native place, where he spent the remainder of his days. From his boyhood, H. wrote verses, some of which he sent to newspapers; but in his collected poems, he has included nothing published earlier than his lines on "Twilight," which appeared in a New York paper in 1818. In the following year, he became associated with Joseph Rodman Drake in contributing the humorous series of "The Croaker Papers" to the same journal. The illness of Drake soon put an end to these papers, and H. commemorated his friend's death in a very beautiful little poem. In 1849, H. wrote his longest poem, "Fanny," a satire on the literature, fashions, and politics of the time, in the measure of "Don Juan." It is said to have occupied less than three weeks in its composition, and derived its immediate and great popularity rather from the pungency of its allusions than from any higher merit. In 1822—1823, H. visited Europe; and in 1827 published an edition of his poems, in which were included several pieces suggested by the scenes and associations of the Old World, among which the lines on Alnwick Castle and on Burns particularly commanded admiration. H.'s style is spirited, flowing, and graceful; his versification almost always very smooth and harmonious. His poems display much geniality and tender feeling. Their humor is delicate and refined. Few poets, and particularly few American poets, who have written well and acquired popularity like H., have written so little. His whole poems are included in a 12mo volume of very moderate size. H. died in November 1867.

HALLECK, Henry Wager, an American general, born in 1816, at Westernville, in the State of New York. He entered West Point Military Academy in 1835, graduated in 1839, and for about a year acted as Assistant Professor of Engineering. During the Mexican war, he served on the lower coast of California, and, for his gallant services, was breveted captain in 1847. From 1847 to 1849, he was Secretary of State for California, under the military government of Kearney, Mason, and Riley; and in 1849 was a member of the convention to form and draft the state constitution of that province. He became captain of engineers in 1853, left the service in 1854, and for some time practised law in San Francisco. On the outbreak of the civil war, he joined the Northern army in 1861 as major-general, and in November of the same year was appointed Commander of the Department of the West. In 1862, he became general-in-chief, resigning in 1864, and becoming Chief of the Staff. As a general, he was able and successful. He died in Jan. 1872. He wrote "Elements of Military Art and Science" (1845). "Mining Laws of Spain and Mexico," &c.

HALLELU'IAH (Heb. *Praise ye the Lord*), one of the forms of doxology used in the ancient church, derived from the Old Testament, and retained, even in the Greek and Latin liturgies, in the original Hebrew. The singing of the doxology in this form dates from the very earliest times; but considerable diversity has prevailed in different churches and at different periods as to the time of using it. In general it may be said that, being in its own nature a canticle of gladness and triumph, it was not used in the penitential seasons, nor in services set apart for occasions of sorrow or humiliation. In the time of St Augustine, the African Church used the Hallelujah only from the feast of Easter to that of Pentecost. In other churches, it was found in most of the services throughout the year, with the exception of the seasons of Lent and Advent and the vigils of the principal festivals. In the Roman Catholic Church, the Hallelujah is introduced both into the mass and into the several hours of the public office, but it is discontinued from Septuagesima Sunday until Easter; and on the contrary, during the interval between Easter and Pentecost, it is introduced more frequently into the services and in circumstances of greater solemnity. It is always omitted in the services for the dead, and on the ember days, at the quarter tense, and on the principal vigils. In the Church of

Digitized by Google

England, the first Prayer-book of Edward VI. retained the Halleluiah in the original Hebrew. In the present Prayer-book, although retained, it is found not in the Hebrew, but in its English equivalent, *Praise ye the Lord.* See Binterim's "Denkwürdigkeiten der Christ-Kathol. Kirche."

HALLER, Albrecht von, an eminent physiologist, was born at Bern, October, 1708, and died in that city, December, 1777. In early life, he was feeble and delicate, being affected with rickets, a disease which is not unfrequently accompanied with considerable intellectual precocity. His father, Nicholas Emmanuel von Haller, who was an advocate, and had the reputation of being an able lawyer, intended him for the church; but his own inclinations being in favor of medicine, he proceeded in 1723 (two years after his father's death) to the university of Tübingen, where he became the pupil of the well-known anatomist, Duvernoy. In 1725 he removed to Leyden, where he attended with much advantage the lectures of Boerhaave and of Albinus, and obtained the degree of Doctor of Medicine in 1727. He then visited London, where he made the acquaintance of Sloane, Douglas, and Cheseldeu; whence he proceeded to Oxford, and afterwards to Paris, where for six months he studied anatomy and botany under Winslow and De Jussieu; but one of his neighbors, who was annoyed by his dissections, having threatened to denounce him to the police, he made a rapid retreat to Basel, where he became the pupil of John Bernoulli, the celebrated mathematician. After seven years' study in these different seats of learning, he returned, in his 23d year, to his native city, and commenced practice as a physician. The professor of anatomy, Meig, having fallen ill, H. undertook the duties of his class; he likewise devoted much of his time about this period to the botany of the Alps; and also published a celebrated descriptive poem, entitled "Die Alpen" (The Alps). In 1735, he was appointed physician to the hospital, and shortly afterwards, principal librarian and curator of the cabinet of medals; but these offices he did not hold long, for in 1736, George II., wishing to establish a university at Göttingen, offered him the professorship of medicine, anatomy, botany, and surgery, which, after some hesitation, he accepted. From this time, he gave up the practice of his profession, and for the next 18 years he devoted himself wholly to teaching and to original research. He took an active part in the formation of the Royal Academy of Sciences of Göttingen; and the memoirs of the society, which appeared under the title of "Commentarii Societatis Regiæ Scientiarum Gottingensis," contain many of his papers. During the period that he held the professorship—viz., from 1736 to 1753—he composed and published 86 works on medical subjects, chiefly on physiology and botany: and it is recorded that he contributed upwards of 12,000 notices or reviews of books to the "Göttingische gelehrte Anzeigen," a monthly periodical work, of which he was editor. In 1753, in consequence of disputes with his colleagues, and probably in part from the delicate state of his health, he resigned his chair, and returned to his native town, where he subsequently held several important and honorable offices. He still, however, retained his position as president of the Royal Academy of Sciences, and other more substantial distinctions, such as a retiring allowance, &c. It was after his retirement from Göttingen that some of his most important writings were published, amongst which must be especially mentioned his "Elementa Physiologiæ Corporis Humani" (Lausanne, 8 vols. 4to, 1757—1766)—by far the most important of his works—and his four "Bibliothecæ," or critical catalogues of works on botany, surgery, anatomy, and medicine. The increasing maladies of his later days did not distract his mind from the study of his favorite subjects. He recorded all the symptoms of his last illness—a combination of gout and disease of the bladder—and the gradual cessation of his vital functions; and his last words, addressed to his physician, were: "My friend, the pulse has ceased to beat."

H.'s eminence as a man of science was duly recognised even in his own lifetime. In 1739, he was appointed physician to the king of Great Britain; he was ennobled by the emperor of Germany in 1748; the universities of Berlin, Oxford, and Utrecht in vain endeavored to obtain him as their professor; and he was an honorary member of all the scientific societies of Europe. His name is especially connected with the doctrine of muscular irritability, which is noticed in the article MUSCLE AND MUSCULAR TISSUE; and if he made but few positive additions to our knowledge, his teaching and writings impressed a new aspect on physiology—a science of which he has deservedly been termed "The Father." But, while his

Digitized by Google

name is indelibly recorded in the annals of science, it should also be remembered that by his work as poet H. greatly contributed to the movement which towards the end of the 18th c. brought new life to German poetry.

HALLEY, Edmund, a celebrated astronomer and mathematician, son of a London soap-boiler, born at Haggerston, near London, in 1656, educated at St Paul's School, and afterwards at Queen's College, Oxford, which he entered in 1673. He early became an experimenter in physics—before leaving school, he had made observations on the variation of the needle. In 1676, he published a paper ("Philosophical Transactions") on the orbits of the principal planets; also observations on a spot on the sun, from which he inferred its rotation round its axis. In November of the same year he went to St Helena, where for two years he applied himself to the formation of a catalogue of the stars in the southern hemisphere, which he published in 1679 ("Catalogus Stellarum Australium"). On his return, he was chosen a Fellow of the Royal Society, and deputed by that body to go to Danzig to settle a controversy between Hooke and Helvetius respecting the proper glasses for astronomical observations. In 1680, he made the tour of Europe, during which he made observations with Cassini at Paris on the great comet which goes by his name, and the return of which he predicted. His observations on this comet formed part of the foundation of Newton's calculation of a comet's orbit. H. returned to England in 1681, and in 1683 published ("Phil. Trans.") his theory of the Variation of the Magnet. The next year, he made the acquaintance of Newton—the occasion being his desire for a test of a conjecture which he had made that the centripetal force in the solar system was one varying inversely as the square of the distance. He found that Newton had anticipated him, both in conjecturing and in demonstrating this fact. For an account of H.'s connection with the publication of the "Principia," see NEWTON. In 1686, H. published an account of the trade-winds and monsoons on seas near and between the tropics, which he followed by some other chemico-meteorological papers. In 1692, he published his hypothesis relative to the change in the Variations of the Needle, to test the truth of which, by obtaining measures of the variations in different parts of the world, he was sent in 1698 in command of a ship to the western ocean; but his crew mutinied, and he was obliged to return. The next year, however, he sailed again on the same expedition, and the result of his observations was given to the world in a general chart, for which he was rewarded by the rank of captain in the navy with half-pay for life. Soon after, he made a chart of the tides in the Channel, and surveyed the coast of Dalmatia for the emperor of Austria. On the death of Dr Wallis in 1703, he was appointed Savilllian professor of geometry at Oxford. In 1705 he published his researches on the orbits of the comets. In 1713, on the death of Sir Hans Sloane, he became secretary of the Royal Society; in 1716 he made valuable experiments with the diving-bell, which were afterwards published; and in 1720, after the death of Flamsteed, he became astronomer-royal, and continued without assistance to conduct the operations at the Observatory with unremitting energy. In this office, and engaged especially in studying the moon's motions, he passed the rest of his life. In 1729 he was chosen a foreign member of the Academy of Sciences, Paris. He died at Greenwich, 14th January 1742, 86 years old. H. had married, in 1686, a daughter of Mr Tooke, auditor of Exchequer, by whom he had several children. Besides the writings mentioned, H. wrote many others. His "Tabulæ Astronomicæ" did not appear till 1749. Among his principal discoveries may be mentioned that of the long inequality of Jupiter and Saturn, and that of the slow acceleration of the moon's mean motion. He has the honor of having been the first who predicted the return of a comet, and also of having recommended the observation of the transits of Venus with a view to determining the sun's parallax—a method of ascertaining the parallax first suggested by James Gregory.

HALLEY'S COMET. See COMET.

HA'LLOWELL, a city in Maine, United States, on the river Kennebec, 9 miles south of Augusta. It has a town-hall, 6 churches, 3 banks, 1 newspaper office, a cotton-factory, &c. It is best known abroad from the fine quality of granite in the neighborhood. Steam-boats and vessels of nine feet draught can load. Pop. in 1870, 3007; 1880, 3,154.

HALLOW-EVEN, or Halloween, the name popularly given to the eve or vigil of

Digitized by Google

All Hallows, or festival of All Saints, which being the first of November, Halloween is the evening of the 31st of October. In England, it was long customary to crack nuts, duck for apples in a tub of water, and perform other harmless fireside revelries. While the same thing can be said of Scotland, the Halloween ceremonies of that country partook more of a superstitious character; taking, among rustics, the form of a charm to discover who should be his or her partner for life. Of these now almost exploded customs, the best summary is that contained in Burns's well-known poem "Halloween." We refer to Brand's "Popular Antiquities" for some notice of old Hallow-even practices.

HALLUCINA'TIONS are morbid conditions of mind in which perception takes place where no impression has been made upon the external organs of the special senses, and where the object is believed to be real and existing. A picture is presented to the imagination when no ray of light has fallen upon the eye; a voice is heard when all around is silent; a pleasant smell fills the nostril when neither flowers nor feast give forth their fragrance. Delusions, on the other hand, originate at the other extremity of the chain of consciousness in the mind itself, and consist in erroneous interpretations of real sensations. A form passes across the vision, and it is regarded as a phantom, or a demon, or what is not and cannot be; a voice may address the listener in accents of tenderness and friendship, which before they reach the mind have assumed the shape of insults and calumnies; and the fresh odor of a rose may suggest notions of poison and pollution. But hallucinations may involve internal experiences as well as the reports from the outer world; nor is it invariably possible or necessary to distinguish hallucinations from delusions. There is a composite state in which the external impression is imaginary, and the interpretation from such an impression, had it been real, is erroneous. A clock is heard by a patient to strike where not a sound is audible by others, and the chime is held to be the announcement of the crack of doom. In all these cases, the sensorium itself must be held to be at fault, whether the nerves of seeing, hearing, &c., be structurally affected or not. These phenomena are observed in connection with all the senses, but in different proportions; the frequency being perhaps in relation to the number of healthy sensations of which the organ is the natural channel, and to the degree of excitement and cultivation to which it is ordinarily subjected. According to one authority, hallucinations of hearing constitute two-thirds of the whole observed; but, upon a more careful analysis, the following tabular expression of frequency appears to be correct: hallucinations of hearing, 49; of vision, 48; of taste 8; of touch, 8; of smell, 1. These conditions are detectable in all mental diseases; but the proportion varies according to the form and the intensity of the alienation. All are more frequent in mania than in monomania and fatuity; and errors of vision are more numerous than those of hearing in mania. Lord Brougham at one time held that the presence of hallucinations should be elected into a crucial test of the existence of insanity. Practical men, however, demonstrate that derangement is not necessarily conjoined with such a symptom. Esquirol held that of 100 lunatics, four-fifths would be affected with hallucinations. Of 145 individuals in Bicêtre, Baudry found that 56 presented hallucinations; and the subsequent researches of Thore and Aubanel in the same hospital shewed 123 affected out of 443 maniacs, monomaniacs, dements, &c. Brière de Boismont, "Des Hallucinations" (Paris, 1845); Aubanel and Thore, "Recherches Statistiques faites à l'Hospice de Bicêtre;" Michéa, "Du Délire des Sensations" (Paris, 1848).

Hallucinations of Sane Men.—In a great majority of cases, hallucinations can readily be traced to mental alienation, which is cognizable by other signs, or to conditions of the nervous system, which impair or pervert without overthrowing the mind; or to general constitutional states, or positive diseases, such as in the case of Nicolai, which involve disturbance of the functions of the external senses. There is, however, a class of phenomena which cannot be included under any of these categories; where objects appear; voices tempt, threaten, soothe, or where a series of impressions are received by the mind, without any corresponding sensations; where the system is perfectly healthy, and where the individual affected is conscious that what he sees or hears is unreal. Medical experience, however, goes to shew that under such circumstances the nerve, or some organ connected with the development of special sensation, or the brain itself, is in an abnormal or excited condition, which falls short of disease, not interfering with the regular discharge of the ordi-

Digitized by Google

nary functions of these parts of the economy, and not being detectable in any other way, and which is sometimes compatible with great intelligence, and even genius. As illustrative of the latter proposition, and of the least morbid aspect of such phantasmata, it may be mentioned that the late Earl Grey was haunted by a gory head, which he could exorcise at will. Swedenborg, while at the head of the government, saw members of the heavenly hierarchy seated among the ministers at the council board, and bowed reverentially to them. Bernadotte encountered a woman in a red cloak in his rides; and a patient has been described who was followed first by a cat, then by a tatterdemalion beggar, and then by a skeleton which never left him, walked side by side, joined his family circle, and peered through his curtains at night. Yet Swedenborg knew that it was not flesh and blood realities he acknowledged; the king shrunk from, but repudiated the red cloak; and the patient disbelieved the skeleton, and detected its true nature and origin.

HALLUIN, a town of France, in the dep. of Nord, 10 miles north-north-east of Lille. Weaving, bleaching, cotton-spinning, and brick-making are carried on, and there are manufactures of linen and calico. Pop. (1872) 8680.

HALMALILLE (*Berrya amonilla*), a tree of the natural order *Tiliaceæ*, closely allied to the Lime or Linden tree of Europe, and much resembling it, but larger; a native of Ceylon, much valued for its timber, which is a favorite house-building wood in that island, and is employed also for carts, casks, and all household purposes, and also for boat-building, as it is believed to resist the attacks of marine worms, and in virtue of a certain unctuosity, to preserve the ironwork from rust. It is exported to Madras—where, from the principal port of exportation, it is known as *Trincomali Wood*—and the Masula boats, which brave the formidable surf there, are made of it. It is a light wood.

HA'LOGENS. This term, which is equivalent to "salt-producers," is derived from the Greek word *hals*, salt, and includes a very distinct and well-characterised group of non-metallic elements—viz., chlorine, bromine, iodine, and fluorine, which form with metals compounds analogous to sea-salt.

The following are their most important characteristics:

1. They combine directly and at an ordinary temperature with the metals, for which they exhibit a very strong affinity; and their combinations with the metals present those properties which pertain to Salts (q. v.). No elements excepting these four possess the property of entering into direct combination with metals, and of thus forming salt-like compounds. When united with the same metal, the salts which the different halogens form are isomorphous; thus, for example, the chloride, iodide, bromide, and fluoride of potassium all crystallise in cubes.

2. They all have a very energetic affinity for hydrogen, with which they all unite in one definite proportion—viz., 2 volumes of the gas or vapor of the halogen with 2 volumes of hydrogen, the union occurring without change of bulk, that is to say, being represented by 4 volumes, and the resulting gaseous compound being intensely acid, and very soluable in water. The acids thus formed are hydrochloric, hydrobromic, hydriodic, and hydrofluoric acids. Moreover, all these halogens (except fluorine) form powerful acids with five atoms of oxygen—viz.; chloric, bromic, and iodic acids; and their salts present numerous points of resemblance.

HA'LOID SALTS. These are the compounds formed by the union of one of the Halogens (q. v.) with a metal. We may mention chloride of sodium (NaCl), bromide of silver (AgBr), fluoride of calcium (CaF), and iodide of potassium (KI), as examples.

HALORAGIA'CEÆ, or Halora'geæ, a natural order of exogenous plants, closely allied to *Onagraceæ* (q. v.).—There are about seventy known species, herbaceous or half-shrubby; pretty much scattered over the world, but almost all aquatic, or growing in wet places. The stems and leaves often have large air-cavities. The flowers are generally small, and the plants insignificant in appearance. Nor have any of them any important uses, except those of the genus *Trapa* (q. v.). The only British species are the Mare's Tail (*Hippuris vulgaris*) and the Watermilfoils (*Myriophyllum*).

HA'LOS, Parhe'lia, Coro'næ, &c. It would not be easy even to enumerate the various distinct phenomena which belong to the above classes; we must therefore

Digitized by Google

be content to consider a few only of the principle varieties; and in fact if the causes of these be thoroughly understood, those of the others present no further difficulties except such as are of a purely mathematical nature.

The first class we have to consider is very common. When the sun or moon is partially obscured by a mist or cloud, the latter *not* being of the species called cirrus (see CLOUD), it is almost invariably surrounded by colored rings of a few degrees only in diameter, called *Coronæ* (crowns). Those surrounding the sun cannot always be seen directly; but by reflection at the surface of still water, or of a glass plate blackened at the back, the glare of the sunlight is sufficiently diminished to permit the corona to be seen. This meteor depends on the DIFFRACTION (q. v.) of light, caused by the small spheres or vesicles of water which compose the cloud, and can easily be imitated by looking at a bright object through a piece of glass which has been breathed upon or dusted with Lycopodium seed. If the diffracting particles be all of the same size, the rings are very well marked; but since they become smaller as the particles increase in size, ordinary fogs and clouds, which generally contain particles of very different dimensions, give a composite effect, which spoils the distinctness and greatly limits the number of the rings. Thus no general rule can be given for the number or colors of the coronæ, but it may be observed that their diminution in diameter is a sign of the increase in size of the watery spheres which cause them, and therefore in general betokens approaching rain, which comes when the particles are no longer able, on account of their size, to float in the air without sensibly falling. As before mentioned, this appearance is very common, and in fact we scarcely see a fragment of a cloud near the sun which does not give traces of color, depending on the average size of the particles of which it consists, and its angular distance from the sun.

A different form of corona is sometimes seen to surround the shadow of the spectator's head, when cast by the sun on a bank of fog—in this case it is sometimes called a *glory*. To this class belong the colors generally seen about the famous "Spectre of the Brocken." See BROCKEN. The same appearances are very frequently seen round the shadow of the spectator when thrown on muddy water, or water carrying numerous small particles of sand. The optical explanation, founded mainly upon reflection and interference, is complete, but not suited to our pages.

So far the phenomena depend merely on the cloud or fog consisting of small particles; nothing has yet been said about the *shape* of the particles. Spherical *drops* of water produce Rainbows (q. v.), and upon the vesicular form that moisture often assumes in the air, probably depend the blue of the sky and the gorgeous tints of sunrise and sunset. But halos (Gr.) and parhelia (Gr. false or mock suns) depend upon the presence in the air of innumerable *crystals* of ice, generally forming a light cirrus cloud. We cannot enter upon a complete explanation of these phenomena, but we shall give a general idea of their origin, referring the student who wishes a thorough knowledge of the subject to a memoir by Bravais ("Journal de l'Ecole Polytechnique," xviii.), who has himself repeatedly witnessed and carefully measured the various appearances in question.

The theory of halos was first roughly attempted by Huyghens; but although his explanations are in the main correct (at all events, as regards the very simplest of the appearances), they are based on the utterly inadmissible supposition, that the halo-producing clouds are formed of cylinders of water, each having an opaque, frozen nucleus. It will be seen that the results of this supposition agree with those of the correct one in a few cases only. Further progress was impossible until the crystalline form and the refractive index of ice were observed. Both of these observations are of great difficulty; but they have been carried out by Wollaston and others with considerable accuracy. After Huyghens, Mariotte, admitting the crystalline form of ice-particles, made some great steps in advance, and much of what he left unexplained was successfully supplied by Young, and after him by Kaemtz. The most complete and systematic explanation of the whole subject, however, is that of Bravais, already referred to. There, references are given to nearly all the accurately recorded observations of halos and parhelia—the great mass of which, of course, are due to arctic voyagers, especially Scoresby and Parry.

Water crystallises in the form of regular hexagonal prisms, sometimes with plane

Digitized by Google

ends perpendicular to the sides, sometimes with hexagonal pyramids as terminals. There is also an immense variety of much more complex forms; but upon the simpler and more common ones already mentioned, depend the ordinary cases of the phenomena we are about to describe. Now, if we consider any two non-parallel faces of one of the above crystals, it is clear that their combination must act as a prism, decomposing white light, which passes through them, into its constituent colors. Every such crystal, then, placed somewhere near the line joining the eye and sun, must in general send to the former some definitely colored ray from each effective pair of surfaces. The refractive index, however, of ice is such that no ray can pass through a prism of it whose angle is greater than about 99°·5; and we are therefore limited to pairs of faces whose inclination is not superior to this. The most important pairs are two *alternate* faces of the prism where the inclination is 60°, and a face with a terminal plane, the angle being 90°.

Halo of 22° Radius.—We may now suppose prisms of ice, with refracting angles of 60°, to be distributed (with every possible position of their axes), nearly between the sun and the spectator, and it is evident that the appearances produced must be symmetrical with regard to the line joining the eye and sun, and must therefore consist of colored circles with the sun as centre. To attain a more exact idea of the nature of these circles, suppose that we are dealing with light of one color only (say red). Now (see PRISM), if a beam of homogeneous light falls on a prism, it is refracted without separation. If the prism be turned gradually and uniformly about its axis, the refracted ray also turns, but *not* uniformly—at first rapidly, then slower, till it reaches a point at which it appears to be stationary for a little; then, on further turning the prism, the refracted ray *retrogrades*, at first slowly, then faster. There is, therefore, a position of the prism called that of *minimum deviation*, for which a slight alteration of the prism produces none in the direction of the refracted ray. Hence, as we have supposed prisms to be in the cloud in every possible position, those which are near the position of minimum deviation will conspire to refract light in the *same* direction, and their effects will be added. All the others will cause a *greater* deviation of the light, but few will conspire to send the light in any given direction. The appearance will therefore be a bright circle of red light surrounding the sun as centre, its angular radius being the angle of minimum deviation, which, for a prism of ice of 60° angle, is about 21° 50′. Inside this circle there will be *no* light; outside, feeble illumination only, becoming fainter as we go further from the sun. With an orange light alone, there would be a somewhat larger circle, and so on. Hence, when white light falls on such a system, the effect is a circular halo, dark within, red on its inner edge, and with a mixture of more or less of the colors of the spectrum from inside outwards; so that, like the rainbow, which it much resembles, it differs from the ordinary Spectrum (q. v.).

If we consider next the light *reflected* from the surfaces of the prisms, this will be *white*, and diffused with approximate uniformity all about the sun.

But the prisms are not likely to be suspended in the air in all positions alike. If the prism be long and fine, it will have a tendency to fall end foremost, i. e., with its axis vertical, or (it may be) horizontal. If it be a flat hexagonal cake (a frequent form of snow), it will tend in the main to fall edgeways, so that, in addition to the halo which depends upon the ice-crystals having every possible position, there are distinct phenomena depending on an excess of the crystals having their axes vertical or horizontal. If we consider the sun as just rising or setting, it is plain that the right and left hand portions of the halo will be much more strongly marked than the others, as these parts are formed by crystals whose axes are vertical, and which form the majority. There are therefore to right and left of the sun, and on the halo, bright-colored images of the sun, which are called *parhelia*, or mock suns.

It is perhaps a little more difficult to explain to the non-mathematical reader the formation of parhelia when the sun is not on the horizon, and to shew why they then separate from the halo, and are formed externally to it, still, however, at the same altitude as the sun. We may, however, make the attempt as follows: Suppose an indefinitely long vertical prism; rays of sunlight falling on this are separated, as before, but if the sun be not on the horizon, they no longer fall on the prism perpendicularly to its edge. Optics, however, shews us that for this oblique incidence also there is a position of minimum deviation, and therefore one angular distance from the sun at which the effects of a great number of prisms conspire, while far

Digitized by Google

fewer conspire at any other angle. It is also shewn that this minimum angle is greater as the incidence is more oblique. Also the inclination of the incident and refracted rays to the edge of a prism is always the same, however the ray may fall. Hence, as the edges of the prisms in question are vertical, the refracted rays appear to come from a point at the same altitude as the sun, and, by what was remarked above, further from the sun as the sun is higher. Hence the formation of the parhelia consisting of two colored images of the sun, at the same altitude as that body, and further beyond the halo as the sun is higher. Accurate measurements of their distance from the sun for different altitudes have been found to accord exactly with the results of calculation from the optical data.

The light *reflected* from the surfaces of the vertical prisms, of course appears to come from an image of the sun in a vertical mirror, which, by optical laws, must have the same altitude as the sun itself. Such images then form a *white* horizontal small circle, passing through the sun and the parhelia. This is often observed, and helps to corroborate the above theory of the colored appearances.

The light reflected from the horizontal terminals of these prisms must evidently produce a single white image of the sun, as much below the horizon as he is above it, and *vice versâ*. This appearance is also common enough.

Tangent Arcs to the Halo of 22°.—We have seen that in many cases the prisms of ice are so short as to be hexagonal plates. Their natural position in falling will be edge foremost, or there will be a multitude of snow-crystals whose axes are nearly horizontal, but of course arranged in all directions in the horizontal plane. Let us consider first all those whose axes are perpendicular to the line joining the spectator with the sun; these evidently (by an explanation similar to that of the parhelia given above) form parhelia *on* the halo at its upper and lower points. Another set, whose axes are also nearly horizontal and parallel, but slightly inclined to the former, will form parhelia to one or other side of the vertical plane passing through the sun, and on account of the obliquity of the incidence, the angle of deviation is increased, and these are *outside* the halo. They are further to the right or left of the sun's vertical plane, and further outside the halo as the crystals are more and more turned in their horizontal plane. The complete result is a brightly colored pair of arcs, which *touch* the halo at its upper and lower points, and lie completely outside. For certain elevations of the sun, these combine, forming a curve like an ellipse, whose centre is the sun, whose larger axis is horizontal, and which touches the halo externally at its upper and lower points.

Halo of 46°.—This depends upon the right-angled prisms, formed by combining a terminal plane with one of the faces of the hexagonal prism; and with the single exception of a different refracting angle, and its consequent greater dimensions, its explanation and its appearance are the same as those of the halo of 22°.

Perhaps the most magnificent, both for brightness and separation of colors, of all the halos of 46° at its upper point. This depends entirely upon the refraction of light through the upper edges of prisms, and whose axes are *vertical*. It is therefore due to the same cause as the parhelia of the halo of 22°; and it is a remarkable proof of the truth of this, that there is but one instance recorded in which the former appeared without the latter, and its absence was then easily accounted for by there being no cloud of ice-crystals near enough the sun to produce the parhelia.

There are also sometimes seen brightly colored arcs touching one on each side the lower half of the halo of 46°. They are explained by the right angles of prisms whose axes are horizontal. Again, a parhelion being itself a source of light, sometimes very intense, may have *its* surrounding halos of 22°, &c. All phenomena of the latter class are termed *secondary*. They are in general, as might be expected, much fainter than the *primary* ones, but in favorable circumstances have been distinctly observed.

In addition to our very imperfect sketch of the results of the prisms of 60° and 90°, we might consider shortly those due to various combinations of planes of the hexagonal pyramid with each other, or with planes of the prism; but the phenomena depending on these, though easily enough predicted mathematically, are not well suited for verbal explanation.

HA'LOSCOPE, the name of a beautiful optical instrument invented by M. Bravais of France, for the exhibition of all the phenomena connected with halos,

Digitized by Google

parhelia, &c. It consists of a vertical axis with a clock movement, for the purpose of giving it a rapid rotation; two glass prisms, one hollow to contain water; two opaque plates of glass to obscure one or two sides of the prisms, as required in different experiments; a quadrangular prism; and a small arm carrying a mirror: this last and the three prisms are all adapted for mounting on the axis. To imitate the parhelion, the vertical axis with the solid glass prism is set in rapid rotation in a darkened chamber, with a candle ten or twelve feet distant, but with the flame on the same plane as the rotating prism; two sides of the prism are to be obscured with the movable opaque slides of glass. The spectator then looks horizontally at the revolving instrument, and sees the parhelion circle. Different dispositions of the apparatus produce the allied phenomena.

HALO'XYLIN, the name of a new kind of explosive material or blasting-powder, which has been invented in Styria by two brothers, and is described as incapable of spontaneous ignition, and as quite free from smoke and noxious gases. It is composed of non-resinous sawdust, charcoal, nitre, and ferrocyanide of potassium, and is twice the bulk of gunpowder, but one-half more powerful. For blasting and mining purposes, it is considered as preferable to gun-powder.

HALSTEAD, a market-town of England, in the county of Essex, is agreeably situated on both banks of the Colne, about 43 miles north-east of London, and on the high-road from that city to Norwich. Its parish church, one of the finest in the county, is in the perpendicular style, with a decorated chancel. The chief educational institution is Lady Mary Ramsey's Grammar School, with a small endowment, founded in 1594. The manufactures are crape, silk, velvet, and paper; brick-making and straw-plaiting are also carried on. Pop. (1871) 5783.

HA'LYARDS, the smaller ropes and tackle used in hoisting sails or other portions of a ship's equipment. The signal halyards are running cords of the best white hemp, passing through a pulley in the truck at the mast-head, or gaff-point, and thence to the deck; the flags when attached to them are rolled up, and then hoisted and expanded to the wind by a jerk when the proper moment arrives.

HALYBURTON, Thomas, a Scotch divine, born 1674, died 1712. He was the author of several works, including "Natural Religion insufficient, and Revealed necessary to Man's Happiness;" "The Great Concern of Salvation;" and "Ten Sermons preached before and after the Celebration of the Lord's Supper." The works, especially the autobiographic memoir, of the "Holy Halyburton," were once very popular among the people of Scotland; and even at the present day they are greatly relished by persons of a serious disposition. They were published, together with an Essay on his Life and Writings, by Robert Burns, D.D. (London, 1835).

HAM, according to the writer of Genesis, was one of the three sons of Noah, and the brother of Shem and Japheth. The word is derived by Gesenius from the Heb. *Hamam*, "to be hot." His descendants are represented in the biblical narrative as peopling the southern regions of the earth, Arabia, the Persian Gulf, Egypt, Ethiopia, Libya, &c. Both he and his son Mizraim appear to have given their name to Egypt in particular. The Coptic or native name of Egypt is *Kem* or *chem*, supposed to be the same word as Ham, and signifying both black and hot. In the hieroglyphic language, the name of Egypt is expressed by the two letters K. M. In the Rosetta Inscription, the word occurs more than ten times, and is read by Champollion, *Chmé*. It is a curious, and somewhat perplexing circumstance, that Ham should have received a name that must have been more appropriate to his descendants than to himself, for we are not told, and there is no reason to believe, that he was more sun-burned or blacker than his brothers. In explanation of this, it is customarily urged that the names of Noah and his sons had "prophetic significations"—an hypothesis which few feel to be altogether satisfactory.

HAM, a small town and fortress of France, in the department of Somme, and situated on the river of that name, is distant 36 miles east-south-east of Amiens, and about 70 miles north-north-east of Paris. It is of ancient origin; coins were struck here in the reign of Charles the Bald (840—877). The seigniory or lordship of Ham, erected into a duchy in 1407, was held by the families of Courcy, Orleans, Luxembourg, and Vendome. The town is chiefly noteworthy on account of its old fortress or castle, built by the Constable de Saint Pol in 1470, and now used as a

Digitized by Google

state prison. Its walls are 89 feet thick, and its principal tower is 108 feet in height, and the same in diameter. It is memorable as the place of confinement of Marbœuf, Moncey, and others; and subsequently of Polignac, Chantelauze, Peyronnet, and Guernon Ranville from 1831 to 1836; and of Louis Napoleon, the late Emperor, from 1840 till 1846. After the *coup d'état* of the 2d December 1851, the republican Generals Cavaignac, Lamoricière, Changarnier, and others were kept here for some time. Pop. (1872) 2674.

HAM, properly the hind part or an angle of the knee; but usually applied to the cured thigh of the ox, sheep, or hog, more especially the last. Ham-curing or, what is the same thing, bacon-curing, is performed in a variety of methods, each country or district having it own peculiar treatment; these, however, relate to minor points. The essential operations are as follows: The meat is first well rubbed with bay-salt, and either left on a bench that the brine may drain away, or covered up in a close vessel; after a few days it is rubbed again, this time with a mixture of salt and saltpetre, to which sugar is sometimes added, or with a mixture of salt and sugar alone. It is then consigned to the bench or tub for at least a week longer, after which it is generally ready for drying. *Wet salting* requires, on the whole, about three weeks; *dry salting*, a week longer. Mutton-hams should not be kept in pickle longer than 12 or 14 days. Some hams are merely hung up to dry without being smoked; others are removed to the smoking-house, which consists of two and sometimes three stories; the fire is kindled in the lowest, and the meat is hung up in the second and third stories, to which the smoke ascends through holes in the flooring. The fire is kept up with supplies of oak or beech chips, though in some districts, as in Westphalia, twigs of juniper, and in many parts of Great Britain peat, are used. Fir, larch, and such kinds of wood, on account of the unpleasant flavor they impart, are on no account to be used. The fire must be kept, night and day, in a smouldering state for about six weeks, at the end of which time, if the ham be not more than five or six inches deep, it is perfectly cured. As cold weather is preferable for this operation, it is chiefly carried on during winter. Many of the country-people in those parts of England where wood and peat are used for fuel, smoke hams by hanging them up inside large wide chimneys, a method common in Westmoreland. The curing of beef and mutton hams is carried on chiefly in the north of England and Dumfriesshire in Scotland; that of pork-hams, on the other hand, forms a large and important item in the industry of various countries. Westphalia, in particular, is celebrated for the delicacy and flavor of its smoked hams. The efficiency of wood-smoke in preserving meat, is due to the presence of pyroligneous acid. See PYROLIGNEOUS ACID and CREASOTE.

HAMADA'N, an important town of Persia, in the province of Irak Ajemi, is agreeably situated at the northern base of Mount Elwund, 180 miles west-south-west of Teheran, in lat. 34° 50′ N., and long. 48° 28′ E. Its streets are narrow and dirty; but the trade and manufactures carried on impart to it a lively and bustling air. It contains numerous caravansaries, excellent and well-furnished bazaars, gardens, baths, and mosques, as well as two notable tombs, one that of the famous Arabian philosopher and physician Avicenna (q. v.), which draws numerous pilgrims to the town; and the other affirmed to be that of Mordecai and Esther. During four months in winter, the cold here is excessive, and fuel with difficulty procured; throughout the rest of the year, however, the climate is delightful. Being the centre of converging routes from Bagdad, Erivan, Teheran, and Ispahan, it is the seat of a large transit trade. H. carries on extensive manufactures of leather; coarse carpets, woollen and cotton fabrics, are also made to some extent. Pop. variously estimated at from 10,000 to 40,000. Recent explorers have concluded, from historical evidence, and from the coins, inscriptions, and other remains found here, that H. occupies the site of the Median Ecbatana. See ECBATANA.

HA'MADRYADS. See NYMPHS.

HA'MAH (Gr. *Epiphania*, and the *Hamath* of the Bible), a city of Syria, 120 miles north of Damascus. The town is built on both sides of the Orontes, which is here crossed by four bridges. A number of huge wheels, turned by the current, raise the water into aqueducts, which convey it to the houses and mosques of the town. The town is enclosed by walls, and the houses are built in the Damascus style of sun-dried bricks and wood. The principal structures are the governor's

Digitized by Google

palace, many mosques, baths, bazaars, and the wheels and aqueducts already mentioned. There are manufactures of silk, cotton, and woollen fabrics, gold and silver thread. H. ranks among the oldest cities in the world. It was a noted place, and the capital of a little kingdom, when the Israelites came out of Egypt; and its name is mentioned in almost every passage in which reference is made to the northern border of the Promised Land. Pop. 80,000.

HAMAMELI'DEÆ. See WITCH HAZEL.

HAMANN, Johann Georg, a very original thinker and author, who, on the titlepage of some of his writings, called himself the "Magician of the North," was born at Königsberg, in Prussia, August 27, 1730. His early life was somewhat checkered; and a failure to acquit himself creditably in some business with which a merchant of Riga had intrusted him, induced him to abandon himself to dissipation, from which he was rescued by reading the Bible. He now devoted himself to the study of the ancient languages and of Oriental literature, and made the acquaintance of many eminent authors. He died at Münster June 21, 1788. As an author H. was little esteemed by his contemporaries, as he opposed the tendencies of the age and defended the dignity of revelation against the attacks of the Rationalists, and was thus placed in opposition to the multitude of scholars. His language, besides, was figurative and symbolical in the highest degree, and frequently concealed rather than revealed the depth of his thinking. But his unmistakable genius and the rich suggestiveness of his ideas were appreciated highly by Herder, Goethe, Jacobi, Jean Paul, and other great men. The influence which he exercised upon Herder's views was very great. All his writings exhibit a deeply spiritual faith in the unseen and the eternal. Fragments of them were published by Cramer under the title "Sibyllinische Blätter des Magus aus Norden" (Leip. 1819), and his "Sämmtliche Werke," by F. Roth (7 vols., Berlin, 1821—1825; an 8th vol., published by G. A. Wiener, Berlin, 1843, contains additions and explanations). His biography was published by E. H. Childemeister ("Hamann's Leben und Schriften," 6 vols., 1857—1873); and by Poel (3 vols., 1874—1876).

HAMBA'TO, a town of Ecuador, in South America, stands in lat. 1° 4' s. and long. 78° 56' w., at the north-east base of Chimborazo, with Cotopaxi, about 25 miles distant, in front. Its elevation above the sea is 8860 feet. At this altitude, wheat grows even under the equator. Though twice destroyed—by an eruption of Cotopaxi in 1698, and by an earthquake in 1797—H. has still a flourishing trade in grain, sugar, and cochineal, and contains about 12,000 inhabitants.

HA'MBURG, The Republic of, is the largest of the free cities of Germany, and is situated in lat. 53° 32' n., and long. 9° 58' e., on the north bank of the Elbe, at its junction with the small streams of the Alster and the Bille, about 75 miles from the German Ocean. H. was founded by Charlemagne in 804, but its commercial history began in the 13th c., when the Emperor Frederick I. granted it the free navigation of the Elbe from the city to the sea, with the right of levying a toll on foreign shipping. These privileges were confirmed by his son, Otho IV., who raised H. to the rank of a free city. In 1241, H. joined with Lübeck in the formation of the Hanseatic League (q. v.), and from that time increased rapidly in wealth and commercial importance, augmenting its territory by the purchase of the township of Ritzebüttel, at the mouth of the Elbe (where the harbor of Cuxhaven is now situated), and several villages and islands in the vicinity of the town. Under the protection of the German emperors, H. soon became powerful enough to defend itself and its commerce both by sea and land, and carried on war for a considerable period against the Dutch and the Danes, though with varying success. It early embraced the doctrines of the Reformation, and in consequence of the vigorous administration of its affairs, never had an enemy within its walls during the stormy period of the Thirty Years' War. The frequently recurring disputes with Denmark ceased in 1768, when that power renounced all claim to any portion of the Hamburg territory. The prosperity of the city continued to increase until 1799, when a great commercial crisis occurred, followed in 1806 by its occupation by the French, which, with a few interruptions, lasted till 1814. During this period the town was strongly fortified, it being Napoleon's intention to make H. the stronghold of his power in Northern Germany. The sufferings of the citizens were

Digitized by Google

very great, and their losses were estimated at £10,500,000. Their miseries culminated in the siege which the French under Davout sustained from the Russians in the winter of 1813—1814, when 30,000 people were driven out of the town, many of whom perished of cold and hunger. In 1815, H. joined the German Confederation, and enjoyed a return of its former prosperity until the terrible fire of 1842, by which, within three days, one-third of the city was destroyed, and great loss of life and property took place. The fire was, however, not an unmixed evil, for advantage was taken of the opportunity to reconstruct that portion of the town, which by its broad, well-lighted, and well-drained streets, and fine and lofty houses, offers a striking contrast to the remaining part, much of which is devoted to wholesale business, and intersected by canals communicating with each other and with the river, by which goods are conveyed in lighters to and from the warehouses. The old ramparts have been converted into gardens and walks, and the beauty of the city is greatly increased by two large sheets of water formed by the Alster, and surrounded by good hotels and private houses, many of which in the suburb of Uhlenhorst, about two miles from H., are very charming.

There are several fine buildings, of which the exchange—where 4000 merchants and others meet daily—and the picture gallery are the principal. Among the churches the principal are—St Nicholas's, built from designs by Sir Gilbert Scott, at a cost of £200,000, as a memorial of the fire of 1842, a very fine Gothic building, with one of the loftiest spires in Europe (483 feet high); St Michael's, built in the 18th c., in the Renaissance style, and also distinguished by a lofty spire (432 feet high); and St Catharine's, which is interesting from its age, being one of the few churches that escaped the fire.

H. is the commercial emporium of Northern Europe, and has recently been connected by bridges across the northern and southern branches of the Elbe with Harburg in Hanover, by which direct railway communication has been obtained with the free city of Bremen, and the route to Paris shortened by several hours. Great facilities have been given for the loading and discharging of steamers by the recent construction of extensive quays furnished with steam-cranes, warehouses, and communication by rail with the whole of the continent. Constant efforts are made to deepen the bed of the river, and under favorable circumstances vessels drawing 18 feet can go up the harbor at high tide. The number of sea-going ships that entered the port in 1876 was 4991, with a burden of 2,180,451 tons, including 2903 steamers of 1,721,048 tons, the total crews being over 70,000. The annual imports have trebled within the last 21 years. The goods received by sea, land, and river, on the average of the five years 1869—1873, amounted to 62,624,000 cwts., with a value of £78,680,000 per annum, of which 24,270,000 cwts., valued at £28,806,000, were from the United Kingdom. The average weight of the outward cargoes in the same period was about 12,000 cwts. In 1875, the total value of imports was £85,050,000.

H. is one of the largest coffee-marts, and next to London, has the largest money-exchange transactions in Europe. It is also one of the principal emigration ports of Germany, above a quarter of a million persons having left during 1870—1874, chiefly for the United States. There are several large joint-stock banks; marine insurance is also carried on extensively, the value of the ships and cargoes insured in 1872 having been £100,500,000. The sea-going ships belonging to H. in 1877 were 439, of 196,011 tons, including 96 steamers, with a burden of 83,826 tons, chiefly belonging to five companies, and maintaining communication with North and South America and the East Indies. The manufactures of H. are of little consequence, and are not estimated to exceed £2,500,000 in value per annum. The principal are cigar-making, spirit and sugar refining, brewing, meat-curing, engineering, and shipbuilding.

The charitable institutions of H. are numerous and well endowed. The most important are the almshouses founded recently by Schroeder and Laeisz, and the Jewish hospital founded by the late Solomon Heine. There are a great many societies and asylums for the relief or reception of various classes, and the poor in general are well cared for. The general hospital has accommodation for 1800 patients, and there is a smaller hospital in connection with the sailors' home. The Rauhe Haus, at Horn, near H., founded by Dr Wichern in 1833, is worthy of notice as a very successful attempt to reform depraved and neglected children. Education is well attended to, and there are several large and excellent private schools, and a school of art, in

Digitized by Google

addition to the Johanneum, a public grammar-school founded in 1528. There are two large public libraries, an observatory, botanical and zoological gardens, the latter being large and laid out with great taste; there are also two large and several small theatres, and a greater number of public gardens and places of amusement than in any other city of the same population.

The constitution of H. is democratic. The executive power is vested in a senate of eighteen members chosen for life, with the assent of the municipal council, one-half of whom must have studied law; the legislative power being confined to the municipal council, consisting of 192 members, who are elected for six years, one-half retiring every three years. There is a very good tribunal of commerce, in addition to the ordinary courts of justice. Appeals can be carried in commercial cases to the supreme court of commerce at Leipsic, and other cases to a court of appeal for the three Hanse towns at Lübeck. In 1866, H. became a member of the North German Confederation, and is now one of the states of the empire, sending three members to the imperial parliament at Berlin. The township of Bergedorf, 10 miles south-east from Hamburg, formerly held jointly with Lübeck, became the sole property of H. in 1868, and the whole territory covers an area of 156 English square miles; pop. (1875) 388,618, of whom about 14,000 are Jews and 7800 Catholics. The city proper with its suburbs had in the same year a pop. of 348,447. As in the time of the Zollverein, H. is still a free port; but the outlying portions of its territory are as formerly without the free-trade limit, and are subject to the same economical arrangements as the rest of the empire. Customs on goods passing beyond the boundaries of the free port are collected mainly at the railway stations of the city. Although H. retains the management of its local affairs, the independent position formerly enjoyed by the republic ceased in 1866; the most noticeable consequence of this being the abolition of the Hamburg flag, and the withdrawal of its numerous consular and diplomatic representatives in foreign countries, in addition to compulsory service for three years in the army or navy by all young men liable to military duty. The estimated revenue of H. in 1876 was £1,200,000.

HA'MELN, an interesting town, and formerly a fortress of Hanover, in the province of the same name, is beautifully situated on a commanding position on the Weser, at the confluence of the Hamel with that river, 25 miles south-west of Hanover. It is surrounded by a wall, formerly surmounted by 20 towers, and defended by a fort, which, however, was blown up by the French in 1806. It is irregularly built, and is full of wooden houses in the old German style: has three churches, including the Münster, a fine old edifice, dating from 1127, and now falling into ruin; and a large educational institution built in 1827. The chain-bridge at H., crossing the Weser, was completed in 1839, and is about 780 English feet in length. Pop. (1875) 9520, chiefly employed in brewing; in the manufacture of paper, cement, woollen goods, and carpets; and in agriculture, salmon-fishing, and general trade. In the earliest times, H. belonged to the Abbey of Fulda, and was a member of the Hanseatic Confederation.

HAMI'LCAR was a name borne by several distinguished Carthaginians, the most celebrated of whom were—1. The commander of the great Sicilian expedition, 480 B.C.; 2. One of the commanders of a Carthaginian army, defeated by Timoleon, the Corinthian general, at the Crimissus, 339 B.C.; 3. (surnamed Rhodanus), the ambassador to Alexander the Great after the fall of Tyre; 4. The governor of Sicily, 317 B.C.; 5. The son of Gisco, who succeeded the preceding, and carried on military operations against the Syracusans and other states with great success, but was at length taken prisoner, and put to death; 6. A commander during the first Punic War, who was very successful against the Romans by land in Sicily, but was afterwards defeated in a sea-fight off Ecnomus, and was thereafter recalled to Africa to oppose Regulus.

But the greatest of all was H. surnamed Barca or *Barak*, i. e., "lightning." While very young, he was appointed to the command of the Carthaginian forces in Sicily, in 247 B.C., at which time the Romans had possession of almost all the island. H.'s first care was to discipline his infantry thoroughly; he then established himself on Mount Ercte (now *Pellegrino*, near Palermo), and from this point made pillaging excursions in all directions, sending his privateers along the coast of Italy as far north as Cumæ, thus obtaining abundant supplies for his troops. From this position the Romans endeavored to dislodge him, but in vain. After three years, he left Ercte,

Digitized by Google

and established himself on Mount Eryx, keeping up his communication with Drepanum and the sea, where the same tactics were repeated on both sides. and with the same want of success on the part of the Romans. But the Carthaginian admiral having been totally defeated off the Aegates Islands, 241 B.C., he was compelled to abandon his fortress, and evacuate Sicily. While H. was engaged in Sicily, he had made large promises to his mercenary troops, which he was unable to perform; they revolted in consequence, and were joined by some of the African tribes. Hanno endeavored to suppress the revolt, but failed; H. was accordingly appointed to the command, and succeeded in utterly defeating the rebels, capturing all their towns, and putting to death their leaders. H. was next appointed commander-in-chief of the Carthaginian army, and was engaged for some time in wars with the neighboring tribes, which were abruptly ended by H.'s entering upon his Spanish campaign in (probably) 236 B.C. His great aim was to found a new empire in Spain, from which, as his basis, he might assail the Romans. Such a kingdom he saw would increase the power and wealth of his native country, and atone to her for the loss of Sicily and Sardinia. This, his great purpose, Hasdrubal and Hannibal endeavored to accomplish. He marched westward, while the fleet under his son-in-law, Hasdrubal, cruised along the coast; he then crossed over at the Strait of Gibraltar, and made war on the natives of Spain, in the course of which he penetrated to the very heart of the country, subdued many tribes and cities, and amassed immense wealth. He spent nine years in Spain, and at length, in 228 B.C., met his death on the field of battle while fighting against the Vettones. His military genius is considered scarcely inferior to that of his son Hannibal.

HA'MILTON, a city of Canada in the province of Ontario, is situated at the west end of Lake Ontario, or rather of that detached section of it which, under the name of Burlington Bay, is connected with the main body of the lake by the Burlington Canal. H. is 45 miles from the Falls of Niagara, 38 from Toronto, and 378 from Montreal. It is situated in the very centre of the finest grain-producing country in America, and it is also an important centre of the chief Canada railways, the Great Western, the Hamilton and Toronto, and the Hamilton and Port Dover lines. The rapid increase of its population is remarkable. In 1841, it was about 3500; in 1850, 10,812; in 1861, 19,096; and at the time of the last census (1871) it amounted to 26,716. The Great Western Railway and its branches have done much to advance its prosperity. The manufacturing establishments of H. are extensive; the principal are locomotive-works, foundries, and car-works. The city returns one member to the legislative assembly.

HAMILTON, a parliamentary and municipal burgh, and market-town of Scotland, in the county of Lanark, is beautifully situated on the left bank of the Clyde, in the centre of a finely wooded district, about 11 miles south-east of Glasgow, with which it is connected by railway. It has a straggling, but at the same time a pleasant rural appearance, many of the houses having a piece of garden-ground attached. The town contains some fine churches; numerous good schools—of which the Academy and St John's Grammar School are the most important; the county-hall, a noticeable Grecian structure; a new town-hall; and extensive cavalry barracks. Many of the females are employed in *tambouring* for the sewed muslin manufacturers of Glasgow. Pop. (1871) 11,299.—Close to the town is Hamilton Palace, the seat of the Duke of Hamilton and Brandon, with the family mausoleum, in the midst of extensive pleasure-grounds bordered by the Clyde. The palace is a large and noble structure, and contains an excellent collection of paintings. On certain days the grounds are open to the public. Cadzow Castle, and the remains of Cadzow Forest, in which a herd of the famous aboriginal breed of wild cattle are kept, are in the vicinity.

HAMILTON, The Family of. This great historical family is known to be of English origin, but when or how it took root in Scotland has not been clearly ascertained. Some genealogists have sought to trace its lineage to Robert, surnamed Blanchmains, third Earl of Leicester, who died in 1190. There is nothing improbable in the claim—the earl's second son was bishop of St Andrews, he had other relations beyond the Tweed, and the cinquefoil on a bloody shield, which was the heraldic bearing of his house, seems from an early period to have been the heraldic bearing of the Scottish Hamiltons. But however probable such a descent may be, it wants proof. The name of the family, obviously territorial, was doubtless taken

Digitized by Google

from some one of the many English manors called Hamilton, scattered through Buckinghamshire, Hampshire, Surrey, Lancashire, Rutlandshire, Yorkshire, and Leicestershire. In the 17th c., the Leicestershire Hamilton—a petty manor, in the parish of Barkby, containing only a shepherd's cottage—was shewn as the cradle of the house. Several persons of the name of Hamilton appear both in English and in Scottish records about the middle of the 13th c, and one of them seems to have held the Yorkshire manor of Hamilton, together with lands in the parish of Oxnam, in Scotland. But the pedigree of the family cannot be carried beyond (1), "Walter Fitz-Gilbert (or Gilbertson) of Hamilton," who, in 1296, held lands in Lanarkshire, and swore fealty to King Edward I. of England as Overlord of Scotland, and in 1314 kept the castle of Bothwell, on the Clyde, for the English. His early surrender of this strong fortress, and of the English knights and nobles who had fled to it from the field of Bannockburn, was rewarded by King Robert Bruce by grants of the lands and baronies of Cadyow and Machanshire in Clydesdale, Kinneil and Larbert in West Lothian, Kirkinner and Kirkowen in Galloway, and other lands forfeited by the Cumyns and other adherents of England. He attained the rank of knighthood, and married Mary, daughter of Sir Adam of Gordon of Huntly, by whom he left two sons. The elder (2), "Sir David Fitz-Walter Fitz-Gilbert," or, as he was sometimes more shortly called, "Sir David Fitz-Walter," or "Sir David of Hamilton," was taken prisoner by the English at the battle of Neville's Cross in 1346, founded a chantry in the cathedral of Glasgow in 1361, and appears among the barons in the Scottish parliaments of 1368, 1371, and 1373. His eldest son (3), "Sir David of Hamilton of Cadyow," died before 1392, leaving by his wife, Janet of Keith, only daughter and heiress of Sir William of Keith of Galston, five sons and a daughter. The eldest son (4), "Sir John of Hamilton of Cadyow," married Janet, daughter of Sir James of Douglas of Dalkeith, by whom he was the father of (5) "Sir James of Hamilton of Cadyow," who, about 1422, married Janet, daughter of Alexander of Livingston of Callander, by whom he had (6) "Sir James of Hamilton of Cadyow," and four other sons.

LORDS HAMILTON, EARLS OF ARRAN, DUKES OF CHATELHERAULT, MARQUISES OF HAMILTON, DUKES OF HAMILTON, DUKES OF BRANDON, &c.—Hitherto the family had been only knightly. It was ennobled in its sixth generation, in Sir James of Hamilton of Cadyow, who, in 1445, was created Lord Hamilton by a charter which erected his manor place of "the Orchard," in the barony of Cadyow, into his chief messuage, and gave it the name of Hamilton, which it still bears. It is to the praise of the first Lord Hamilton that, in 1460, he founded a college in the university of Glasgow—the first college in Scotland founded by a layman. Allied both by marriage and by descent to the Douglases, he followed their banner in the beginning of their great struggle with the crown. But he forsook them at a critical moment in 1454, and his seasonable loyalty was rewarded by large grants of their forfeited lands, and, at a later period, when he must have been well advanced in years, by the hand of the Princess Mary, the eldest daughter of King James II., and the widow or divorced wife of Thomas Boyd, the attainted Earl of Arran. Lord Hamilton survived his marriage only five years, dying in 1479. His only son, James, second Lord Hamilton, was, in 1503, made Earl of Arran, and had a grant of that island, the dowry of his mother on her first marriage. After playing an important part in public affairs during the minority of King James V., he died in 1529, being succeeded by the eldest son of his third wife (a niece of Cardinal Beaton), James, third Lord Hamilton, Second Earl of Arran. The death of King James V. in 1542 left only an infant of five days old between him and the throne. He was at once chosen regent of the kingdom and tutor to the young queen, and declared to be "second person in the realm"—a position which carried with it something of royal style. He signed or superscribed his name as "James G." or simply "James," and wrote himself "James, by the grace of God, Earl of Arran and Lord Hamilton, Governor and Prince of Scotland." He held his high offices till 1554, when he resigned them in favor of the queen-mother, Mary of Guise, receiving in return, from King Henry II. of France, a grant of the duchy of Chatelherault. His nearness to the throne, his great following, and large possessions, left him still a person of such mark that his eldest son, the Earl of Arran, as he was called, was proposed at one time as the husband of Queen Mary of

Digitized by Google

Scotland, and at another time as the husband of Queen Elizabeth of England. The career which opened with such high aspirations came to a sad and unlimely end; the earl was afflicted with madness in 1562, and never recovered his reason, although he lived till 1609. His father, the first Duke of Chatelherault, dying in 1575, his second son, Lord John Hamilton, the lay-abbot, or commendator of Arbroath, became virtual head of the house, and as such was, in 1599, created Marquis of Hamilton. He died in 1604, being succeeded by his son James, the second marquis, who, in 1619, was created Earl of Cainbridge in England, and died in 1625. He was succeeded by his eldest son James, the third marquis who led an army of 6000 men to the support of King Gustavus Adolphus of Sweden in 1631—1632, and a few years later acted a conspicuous part in the great contest between King Charles I. and the Scottish Convenanters. That king in 1643, created him Duke of Hamilton, with remainder to the heirs-female of his body, in the event of the death of himself and his brother without male issue. In 1648, he led a Scottish army into England for the king's relief, but was encountered and defeated by Cromwell at Preston, in Lancashire. He escaped from the field of battle, but soon afterwards was forced to surrender himself prisoner to the parliamentary forces. He was beheaded at Westminster in March 1649, when he was succeeded by his brother William, who, in 1639, had been created Earl of Lanark. He died in 1651 of the wounds which he had received at the battle of Worcester. The duchy of Hamilton, in terms of the patent of creation, now devolved on the daughter of the first duke, Lady Anne, whose husband, Lord William Douglas, Earl of Selkirk, was, in 1660, created Duke of Hamilton for life. He died in 1694. The Duchess Anne, who survived till 1716, had in 1698, resigned her titles in the king's hands in favor of her eldest son, James, Earl of Arran, who was anew created Duke of Hamilton with the precedency of 1643. In 1711 he was created Duke of Brandon in England, but the House of Lords refused him a seat or vote in parliament on the ground that the crown was disabled by the Act of Union from granting a peerage of Great Britain to any person who was a peer of Scotland before the Union. The duke was killed in a duel in Hyde Park with Lord Mohun in 1712. He was succeeded by his eldest son, James, who, dying in 1743, was succeeded by his eldest son, James, who in 1752 married the famous beauty Elizabeth Gunning, and died in 1758, being succeeded by his eldest son, James George, an infant of three years old. On the death of the Duke of Douglas in 1761, the male representation of the "red" or Angus branch of the Douglases, with the titles of Marquis of Douglas, Earl of Angus, &c., devolved on the Dukes of Hamilton as descendants of the Duchess Anne's husband, William, Earl of Selkirk, third son of the first Marquis of Douglas. Dying in 1769 in his 15th year, James George, seventh Duke of Hamilton, was succeeded by his only brother Douglas, who in 1782 took his seat in parliament as Duke of Brandon, the House of Lords being now satisfied, after consultation with the twelve judges, that the Act of Union did not prohibit the crown from making a peer of Scotland a peer of Great Britain. Duke Douglas died without issue in 1799, when the titles and estates passed to his uncle Archibald, the second son of James, the fifth duke. Duke Archibald, dying in 1819, was succeeded by his eldest son, Alexander, who in 1810 married a daughter of Mr. Beckford of Fonthill, and died in 1852, when he was succeeded by his only son, William Alexander Anthony Archibald, eleventh Duke of Hamilton in the peerage of Scotland. He died in 1863, and was succeeded by William Alexander Louis Stephen Douglas Hamilton, the present duke, who was born in 1845.

LORDS PAISLEY, LORDS ABERCORN, EARLS OF ABERCORN, LORDS STRABANE, VISCOUNTS STRABANE. VISCOUNTS HAMILTON, MARQUISES OF ABERCORN, DUKE OF ABERCORN, &c.—Lord Claud Hamilton, fourth son of the first Duke of Chatelherault, was appointed commendator of the abbey of Paisley, in 1553, created Lord Paisley in 1587, and died in 1622. During his life, his eldest son, James, was made Lord Abercorn in 1603, and Earl of Abercorn in 1606. He had large grants of lands in Ulster; and dying in 1618, was succeeded by his eldest son, James, who in 1616 had been created Lord Strabane in the Irish Peerage. The sixth Earl of Abercorn was, in 1701, created Viscount Strabane in the peerage of Ireland. The eighth Earl of Abercorn, then one of the 16 Scottish representative peers, was, in 1786, created Viscount Hamilton, in the peerage of Great Britain; when the House of Lords found, by a vote of 52 to 38, that a peer of Scotland who had been created a peer of Great Britain, could not sit in parliament as a representative of the peerage of Scot-

Digitized by Google

land. His nephew, the ninth Earl of Abercorn, was, in 1790, created Marquis of Abercorn. It was ruled in his case, by the House of Lords, in 1793, that a peer of Scotland, who had been created a peer of Great Britain, was entitled to vote in the election of the Scottish representative peers. On the death of the second Duke of Hamilton, in 1651, the second Earl of Abercorn had claimed the male representation of the House of Hamilton; and in 1861, the second Marquis and tenth Earl of Abercorn (created Duke of Abercorn in 1868), was served heir-male of the first Duke of Chatelherault, in the Sheriff Court of Chancery at Edinburgh, under protest by the Duke of Hamilton, Brandon, and Chatelherault. The Duke of Abercorn is one of three peers who hold peerages in Scotland, in Ireland, and in Great Britain; the others being the Marquis of Hastings, (Earl of Loundoun, in Scotland, Lord Grey de Ruthyn, &c., in England, Earl of Moira, in Ireland, Lord Rawdon, in Great Britain); and the Earl of Verulam (Lord Forrester of Corstorphine in Scotland, Viscount Grimstone in Ireland, Lord Verulam in Great Britain). The House of Abercorn gave birth, in 1646, to Anthony Hamilton (q. v.), the author of the charming "Mémoires de Comte de Gramont." He was the grandson of the first Earl of Abercorn.

Earls of Selkirk.—Lord Charles Hamilton, third son of Anne, Duchess of Hamilton, was, in 1688, on his father's resignation of the title, created earl of Selkirk, with the precedency of 1646. Dying childless in 1739, he was succeeded by his brother, Lord John Hamilton, Earl of Ruglen, who died without male issue in 1744, when the title of Earl of Selkirk passed to his grand-nephew, Dunbar Hamilton of Baldoon (the grandson of Lord Basil Hamilton, sixth son of Anne, Duchess of Hamilton). He died in 1799, and was succeeded by his son Thomas, who, dying in 1820, was succeeded by his son Dunbar James, the present and sixth earl.

Earls of Orkney.—Lord George Hamilton, fifth son of Anne, Duchess of Hamilton, was, in 1696, created Earl of Orkney, with remainder to the heirs whatsoever of his body. Dying in 1737, he was succeeded by his eldest daughter, whose great-great-grandson, Thomas John Hamilton Fitzmaurice, is now fifth Earl of Orkney.

Earls of Ruglen.—Lord John Hamilton, fourth son of Anne, Duchess of Hamilton, was, in 1697, created Earl of Ruglen, with remainder to the heirs whatsoever of his body. He succeeded to the title of Earl of Selkirk on the death of his brother in 1739, and died in 1744, when the title of Earl of Selkirk went to his grand-nephew, and the title of Earl of Ruglen went to his eldest daughter, Anne, the widow of William, second Earl of March. On her death in 1748, the earldom of Ruglen devolved on her son, William, Earl of March, afterwards fourth Duke of Queensberry; and on his death in 1810, the title of Earl of Ruglen became extinct.

Earls of Haddington.—Sir Walter Fitz-Gilbert, the first ascertained ancestor of the House of Hamilton, had a brother, Sir John Hamilton of Rossaven, the progenitor of the family of Fingaltou and Preston, which, in 1788, gave birth to Sir William Hamilton, the famous scholar and philosopher; and of the family of Innerwick, which, in 1563, gave birth to Sir Thomas Hamilton, nicknamed "Tam of the Cowgate," one of the ablest and most learned of Scottish lawyers. He was created Lord Binning and Byres in 1613, and Earl of Melrose (a title afterwards changed into Haddington) in 1619. His descendant, George Arden Baillie Hamilton, is now eleventh Earl of Haddington.

Lords Bargeny.—Sir John Hamilton of Bargeny and Carriden, the illegitimate grandson of the first Marquis of Hamilton, was, in 1639, created Lord Bargeny. The title became dormant or extinct on the death of the fourth lord in 1756.

Lords Belhaven and Stentoun.—Sir James Hamilton of Biel married a natural daughter of the second Marquis of Hamilton, and was, in 1647, created Lord Belhaven and Stentoun, with remainder to his heirs-male whatever. He resigned the title in 1675, when he had a new patent creating him Lord Belhaven and Stentoun for life, with remainder after his death to the husband of one of his granddaughters. John Hamilton (son of Robert Hamilton of Barncluith, a judge of the Court of Session). This gentleman, who succeeded to the title and estates in 1679, distinguished himself by his wild but eloquent speeches against the Union. He died in 1708, and was succeeded by his son John, who, being drowned in 1721, was succeeded by his son John, who died in 1764, and was succeeded by his brother James, who died in

Digitized by Google

1777. On his death, the great estates of the family passed to Mrs Mary Hamilton-Nisbet, wife of Mr Nisbet of Dirleton, and are now possessed by her granddaughter, Lady Mary Bruce-Nisbet-Hamilton. The titles were, in 1799, adjudged by the House of Lords to William Hamilton of Wishaw (as descended from the House of Barnclaith). His son, Robert Montgomery Hamilton, 7th Lord Belhaven and Stentoun, was, in 1831, created Lord Hamilton of Wishaw in the peerage of the United Kingdom. The title became dormant in 1868, but was adjudged in 1875 to James Hamilton, who thus became the 9th lord.

VISCOUNTS BOYNE.—Gustavus Hamilton, the grandson of Lord Claud Hamilton, first Lord Paisley, was, in 1715, created Lord Hamilton of Stackallan, and, in 1717, Viscount Boyne, in the Peerage of Ireland. His descendant, Gustavus Frederick Russell Hamilton Russell, created in 1866 Baron Brancepeth in the peerage of the United Kingdom, is now the 8th viscount.

VISCOUNTS OF CLANBOY, EARLS OF CLANBRASSIL, &c.—James Hamilton, son of Hans Hamilton (a natural son of Archibald Hamilton of Raploch), vicar of Dunlop, in Ayrshire, settled in Ireland about 1587, and, in 1622, was created Viscount of Clanboy. His son James was created Earl of Clanbrassil, and dying in 1659, was succeeded by his son Henry, on whose death, in 1675, the title became extinct. It was revived, nearly a century afterwards, in favor of his kinsman, James Hamilton of Tullimore (the grandson of Hans Hamilton, vicar of Dunlop), who in 1719 had been created Viscount Limerick and Lord Clanboy, and in 1756 was made Earl of Clanbrassil in the peerage of Ireland. On the death of his son James in 1799, the titles became extinct. His estates went to his sister Anne, Countess of Roden, whose grandson, Robert, Earl of Roden, was, in 1821, created Lord Clanbrassil in the peerage of the United Kingdom.

A "Briefe Account of the Family of Hamilton," written by Dr James Baillie of Carnbroe, during the first half of the 17th c., is preserved among the MSS. in the Advocates' Library at Edinburgh. A "History of the House of Hamilton," written about sixty years afterwards by Hamilton of Wishaw, is not now known to be extant. "Memoirs of the Lives and Actions of James and William, Dukes of Hamilton and Chatelherault," by Gilbert Burnet, afterwards Bishop of Salisbury, were published in 1677. Mr. John Anderson, surgeon at Hamilton, published "Historical and Genealogical Memoirs of the House of Hamilton" in 1825, in 1 vol. 4to.

HAMILTON, Alexander, a celebrated American statesman, born January 1757, in the West Indian island of Nevis, was the son of a Scotch merchant who had married a young French widow. His father soon failed in business, and Alexander, at the age of twelve, had to enter the counting-house of a rich American merchant, named Cruger. His extraordinary abilities, however, induced some of his friends to procure for him a better education than could be got at home. He was accordingly sent to a grammar-school at Elizabethtown, New Jersey; and shortly afterwards entered Columbia College, New York. On the first appearance of disagreement between Great Britain and her colonies, H., still a schoolboy, and barely 18, wrote a series of papers in defence of the rights of the latter, which were at first taken for the production of the eminent statesman Jay, and which secured for the writer the notice and consideration of the popular leaders. On the outbreak of the war, he obtained a commission as captain of artillery, gained the confidence of Washington, was made his aide-de-camp in 1777, and acquired the greatest influence with him as his friend and adviser.

In 1780, he married a daughter of General Schuyler, who was a member of a very old family. On the termination of the war, he left the service with the rank of colonel, and, betaking himself to legal studies, soon became one of the most eminent lawyers in New York. In 1782, he was elected by the state of New York a representative at the Continental Congress; in 1786, he became a member of the New York legislature; and in 1787, he was appointed one of the delegates to the convention which met at Philadelphia, for the purpose of revising the Articles of Confederation. In conjunction with Madison, he had the most important share in drawing up the constitution afterwards adopted. He was a strong supporter of the federal, as opposed to the democratic party; and, along with Jay and Madison, defended the constitution against all attacks, by a series of letters in the "Daily Advertiser" of New York, afterwards collected and published under the title of "The Federalist.

Fifty-one out of the 85 numbers of which the work is composed were written by H. On the establishment of the new government in 1789, with Washington as president, H. was appointed secretary of the treasury. The disorder of the public credit, and the deficiency of official accounts of the state treasure, rendered this office one of peculiar difficulty. In order to re-establish public credit, he carried, in spite of much opposition, a measure for the funding of the domestic debt, founded a national bank, rearranged the system of duties, and altogether shewed himself one of the very greatest of American financiers. In 1795, he resigned his office, and resumed the practice of law in New York. When the war with France broke out in 1798, he was, according to the wish of Washington, made major-general of the United States army; and, on the death of Washington, he succeeded to the chief command. When peace was restored, he returned to his civil duties, but became involved in a political quarrel with Aaron Burr. This difference unhappily culminated in a duel, in which H. received a wound, of which he died the following day (July 12, 1804).

His writings, exclusive of "The Federalist," have been published in 7 vols., by his son, John C. Hamilton.

HAMILTON, Anthony, Count de, descended from the Scottish ducal family of that name, was born in Ireland in the year 1646. After the execution of Charles I., he with his parents, followed the royal family to France. On the accession of Charles II. in 1660, he returned to England, but was excluded from office as being a Catholic. James II. gave him a regiment of infantry in Ireland, and made him governor of Limerick; but after the abdication of that monarch, H. returned to France, where he passed the rest of his life, and died at St Germain-en-Laye in 1720. His writings are full of wit and talent, particularly his "Contes de Feerie" (3 vols. Paris, 1805). His "Mémoires de Grammont" is a lively and spirited production, exhibiting a free and faithful delineation of the court of Charles II. It has been often translated into English. The last edition is that in Bohn's Series, with Scott's notes and illustrations. One of the best editions of his collective works is that published by Renouard (3 vols. Paris, 1812).

HAMILTON, Patrick, one of the most prominent precursors of the Scottish Reformation, was a younger son of Sir Patrick Hamilton of Kincavel and Stanehouse, and of Catherine Stewart, daughter of Alexander, Duke of Albany, second son of King James II., and, in all probability, was born in the year 1504, and in the city of Glasgow. He was educated at the university of Paris, where he took his degree in 1520, after which he proceeded to Louvain, where he remained for some time, and thence removed to Basel 1521.

When H. settled in St Andrews in 1523, he brought with him the new tastes and interests which he had learned to cherish. For some time, his opinions attracted no particular attention. He quietly pursued his theological studies, and did not as yet venture to put himself forward as a reformer. He had been appointed in his boyhood Abbot of Ferne, and although he never went into residence or lived as a monk, he was content to enjoy the advantages and dignity of his ecclesiatical position. But gradually his convictions matured. From agreeing with Erasmus, he came to agree with Luther; and about 1526 he appears to have announced his new views in such a manner as to draw the notice of the Archbishop Beaton. Early in 1527, Beaton made "inquisition" into the grounds of rumor against him, and found that he was "infamed with being disputing, holding and maintaining diverse heresies of Martin Luther and his followers, repugnant to the faith," and thereupon proceeded to "desire" him to be formally summoned and put to trial. In the following year he carried out his summons by a professed trial and conviction, declaring him to be worthy of death. In the meantime H. had fled to Germany, where he became familiar with Luther and Melancthon. The Protestant education of H. was in this manner very complete. Such a man, while he became a reformer, became one in no sectarian sense. His doctrinal opinions were characterised by something of the cosmopolitan breadth which marked his training, and by a scriptural simplicity, befitting his honest and persevering spirit of inquiry. The substance of his doctrine has been fortunately preserved by his own pen under the title of "Patrick's Places;" and simplicity, combined with comprehension and aphoristic brevity, may be said to be the chief characteristics of them.

Digitized by Google

After a residence of six months, H. returned to his native country. He repaired to the family mansion at Kincavel, and there, in the neighborhood of Linlithgow, openly preached the gospel. What is more remarkable, he is supposed, during this brief period of quiet and retirement at Kincavel, to have married. It is somewhat strange that, following such an event, he should have been induced to quit his retirement, where he was in comparative safety, and proceed to St. Andrews. Beaton, however, contrived to allure him within his grasp. He "travailed with the said Mr. Patrick," Knox says, "that he got him to St. Andrews." Hopes seem to have been held out of some good being effected by a conference with him as to the state of the church and its need of reformation; for "reformation" of some kind was a common talk at this time in the church, and many plans were considered, and some attempted for carrying it out.

H. arrived at St Andrews in January 1528, and took up his abode in a lodging provided for him by the archbishop. A conference was held, in which his opponents shewed a conciliatory spirit, and even to some extent expressed concurrence in his views. No advantage appears to have been taken of his former summons and condemnation. He was allowed openly, for some time, to promulgate his sentiments in the city and university. With all visitors he freely conversed, and among these, with Alexander Alane or Alesius, at this time one of the canons in the priory, and with Alexander Campbell, one of the Dominican friars, "a young man of good wit and learning," suborned, it is alleged, by Beaton, to entrap him into avowals of heretical opinion. After a month or so (*plus minus mensem*, says Alesius), he was summoned to answer before Beaton to a charge of heresy. The trial took place on the last day of February, and the result, in spite of his luminous and unanswerable argument was, that H. was condemned for divers heresies and "detestable opinions" —deprived of all dignities and benefices in the church, and delivered over to the secular power to be punished. The sentence was carried out without delay. The warrant of the secular power must have been already secured, for on the very same day on the morning of which he was tried, H. was consigned to the stake in the front of the gate of St Salvador's College. He died as he had lived, a humble, earnest, heroic man. His character, if it scarcely attained to greatness in his brief lifetime, yet shines with a chastened and magnanimous lustre through the fires of his early martyrdom. His death probably did more to extend the Reformation in Scotland than even his life could have done. The "reik of Mr Patrick Hamilton," said one of Beaton's own retainers, "has infected as many as it did blow upon."

HAMILTON, Sir William, of Preston, Bart., the most learned and scientific philosopher of the Scottish school, was born March 8, 1788, at Glasgow, where his father, Dr. William Hamilton, and his grandfather, Dr. Thomas Hamilton, held in succession the chairs of Anatomy and Botany. Though the Hamiltons of Preston (Haddingtonshire), who were raised to a baronetcy in 1673, had not assumed their title since the death of Sir William Hamilton in November 1688, when his brother and heir, Sir Robert, the Covenanter, refused to take the oath of allegiance, the philosopher made good his claim to represent them, and therefore to be descended from the leader of the Covenanters at Drumclog and Bothwell Bridge. After gaining high distinction, especially in the philosophical classes, at Glasgow, he went in 1809 to Balliol College, Oxford, as a Snell exhibitioner, and there, notwithstanding the unusually high standard of scholarship at the time, the position which he took never had, nor has been surpassed. It was at this time, moreover, that he laid the basis of his vast erudition in medieval and modern, as well as in ancient literature, and he himself felt that his residence in Balliol was the most important period of his life in determining the drift of his subsequent speculations and studies (see "Discussions," 2d ed., p. 750, note). He left Oxford in 1812, and entered the Scotch bar in 1813, but he seems never to have had any practice in his profession except what became incumbent on him afterwards, on being appointed crown-solicitor of the court of teinds. In 1820, on the death of Dr. Brown, he was an unsuccessful competitor for the chair of Moral Philosophy in Edinburgh. In the following year, however, H. was appointed to the professorship of History by its patrons, the Faculty of Advocates.

H. had now reached his 30th year, without giving to the world any indication of those speculations which he had been silently and slowly maturing. But in 1829

Digitized by Google

there appeared in the "Edinburgh Review" a critique of Cousin's "Cours de Philosophie" of the previous year, in which was developed that philosopher's doctrine of the Infinite. The critique immediately excited admiration not only among the few in our island who comprehended it, but much more extensively on the continent, Cousin himself being among the first to acknowledge that his reviewer at once understood thoroughly the theory which he opposed, and combated it with a speculative power, with a knowledge of philosophical systems, and a command of philosophical expression, which he had not expected to find existing in Britain. For some years after this, H. was a regular contributor to the "Edinburgh Review." Besides other philosophical articles, two of which, on the Philosophy of Perception, and on Recent Publications in Logical Science, are especially celebrated, he contributed several on education and university reform. Many of these contributions, besides being republished in Mr Crosse's "Selections from the Edinburgh Review," were translated into German, French, and Italian, the French collection, "Fragments de Philosophie," being especially valuable for the introduction, appendix, and notes of its editor, M. Peisse. In 1852, they were all edited by H. himself, with large notes and appendices, under the title of "Discussions in Philosophy and Literature, Education, and University Reform." In 1836, after a severe contest, H. was elected to the chair of Logic and Metaphysics in Edinburgh. During his first session, he delivered a course of lectures on Metaphysics, which was followed in the succeeding session by a course on Logic; and these two courses he continued to read on each alternate year till the close of his life. His influence soon began to shew itself in the university among the young men who were attracted thither from different parts of Scotland, and other countries, in many cases chiefly for the sake of hearing H.; and many of his pupils, now rising to distinction in various professions, trace to the impulses which issued from his class the most valuable element of their education. Extensive notes of his lectures were taken by his students, and numerous copies of them, transcribed from short-hand reports, were in circulation during the later years of his life. Since his death they have been published under the editorship of Professors Mansel and Veitch ("Sir William Hamilton's Lectures," 4 vols. 1859–1861). These lectures, which were mostly written during the currency of the sessions in which they were first delivered, want the exactness of thought and expression which render the works revised by himself for publication models of philosophical composition; but this may be said to convey higher value to them as introductory works. Still it is to be regretted that the materials embodied in these volumes were never, as was intended, wrought into another work which H. had already planned at the time of his appointment. This was his edition of the works of Reid, with notes and supplementary dissertations. It is perhaps impossible to address any writings which have received the same amount of editorial care. The general aim of H.'s whole philosophy is, in fact, but the special aim of this edition of Reid. His conviction was, that the philosophy of common sense represents the highest reaches of human speculation, and he sought, accordingly, in his annotations of Reid's writings, as in his independent works, to point out the relation of the Scottish philosophy to the systems of other countries, as well as to translate it into a more scientific expression, that he might bring into clearer view at once its true character and the real basis on which it rests. In this, therefore, more than in any of his other works, he betrays his fondness for eliciting his own theories from the hints of previous thinkers; his peculiar doctrines of perception, of the conditioned, of mental reproduction, &c., are traced to the writings of Aristotle. Valuable, however, as this work is, its latest edition contains references to numerous dissertations beyond that, in the middle of which it abruptly stops. This is, undoubtedly, to be attributed to the decay of H.'s health. By the paralysis of his whole right side, though his mind continued unimpaired, his power of work was seriously curtailed during the later years of his life. He was, however, generally able, with an assistant, to perform the duties of his class till the close of session 1855—1856, when his health suddenly became worse, and he died 6th May. See his life by Prof. Veitch (1869).

The time has scarcely come for estimating the position of H. in the history of philosophy. Though his system professes to be merely an explication of the Scottish philosophy, he seems to be already creating an independent school, and, indeed, it may be questioned whether all his exegetical skill has vindicated the position claimed for Reid, whether, therefore, it would not have been better for H.

Digitized by Google

had he struck into a separate path. For while his philosophy is distinguished in general from previous Scottish speculations by its more rigorously systematic character, it ventures, as in his doctrine of the conditioned, into realms of thought, whose existence had been scarcely surmised by any of his countrymen. This doctrine, which limits positive thought to the conditioned sphere between the contradictory poles of the infinite and the absolute, has attracted more attention than any of his other doctrines, especially since the publication of Mr Mansel's "Bampton Lectures" in 1858; and though H.'s discussion is confined to the metaphysical aspects of the question, and is perhaps incompatible with a consideration of the ethical ideas which must be embraced in our conception of the Infinite Being, it is likely for some time to gather round it the higher efforts of British speculation. H. is also worthy of being distinguished by his important contributions to logic. These may be reduced to the two principles (1) of distinguishing reasoning in the quantity of extension from reasoning in that of comprehension, and (2) of stating explicitly what is thought implicitly; from the former of which issues his twofold determination of major, minor and middle terms, as of major and minor premises; from the latter the quantification of the predicate, the reduction of the modes of conversion to one, and his numerous simplifications in the laws of syllogism.

HAMILTON, Sir William, grandson of William, third Duke of Hamilton, born in Scotland in 1730, was, in 1764, appointed English ambassador to the court of Naples. During his residence there, he took an active part in the excavation of the ruins of Herculaneum and Pompeii, and collected a rare assortment of art-relics, consisting chiefly of Greek and Etruscan antiquities, which was afterwards purchased for the British Museum. He was recalled to England in 1800; but while on his way home the vessel in which he sailed was unfortunately wrecked, and a great part of his collection of antiques lost. Drawings of these had, however, been preserved, which were afterwards published in his "Antiquités Etrusques, Grecques, et Romaines, tirées du Cabinet de M. Hamilton" (4 vols. Naples, 1766). He also published "Observations on Mount Vesuvius, Mount Etna," &c. (Lond. 1773): "Campi Phlegraei" (Naples, 1776—1777), &c.; besides some papers in the "Philosophical Transactions" (Lond. 1767—1795). H.'s claim on the British government for special services was disallowed, and he died at London in comparative poverty, 6th April, 1803.—The wife of H. was the notorious Lady Hamilton, whose name figures unpleasantly in the biography of Lord Nelson. She died at Calais in 1816, and her Memoirs have been published.

HAMILTON, Sir William Rowan, L.L.D., one of the few really great mathematicians of the present century, was born in Dublin in August 1805. From his infancy he displayed extraordinary talents, having at the age of 13 a good knowledge of thirteen languages. Having at an unusually early age taken to the study of mathematics, in his 15th year he had mastered thoroughly all the ordinary university course, and commenced original investigations of so promising a kind, that Dr Brinkley, himself a very good mathematician, took him under his especial patronage. His earlier essays, connected with contact of curves, and caustics, grew by degrees into an elaborate treatise on the "Theory of Systems of Rays," published by the Royal Irish Academy in 1828. To this he added various supplements, in the last of which, published in 1833, he predicted the existence of the two kinds of conical refraction (see REFRACTION), the experimental verification of which by Lloyd still forms one of the most convincing proofs of the truth of the Undulatory Theory of Light. See LIGHT. The great feature of his "Systems of Rays" is the employment of a single function, upon whose differential coefficients (taken on various hypotheses) the whole of any optical problem is made to depend. He seems to have been led by this to his next great work, "A General Method in Dynamics," published in the "Philosophical Transactions" for 1834. Here, again, the whole of any dynamical problem is made to depend upon a single function and its differential coefficients. This paper produced a profound sensation, especially among continental mathematicians. Jacobi of Königsberg took up the purely mathematical part of H.'s method and considerably extended it; and of late years the dynamical part has been richly commented on and elaborated by several French mathematicians, all uniting in their admiration of the genius displayed in the original papers. For these researches, H. was elected an honorary member of the Academy of St Peters-

Digitized by Google

burg, a rare and coveted distinction. The principle of *varying action*, which forms the main feature of the memoirs, is hardly capable, at all events in few words, of popular explanation. Among H.'s other works, which are very numerous, we may mention particularly a very general "Theorem in the Separation of Symbols in Finite Differences," and his "Examination of Abel's Argument concerning the Impossibility of solving the General Equation of the Fifth Degree."

We may also particularly allude to his memoir on "Algebra as the Science of Pure Time," one of the first steps to his grand invention of quaternions. The steps by which he was led to this latter investigation, which will certainly, when better known, give him even a greater reputation than conical refraction or varying action has done, will be more properly treated under QUATERNIONS. On the latter subject, he published, in 1853, a large volume of "Lectures," which, as the unaided work of a single man in a few years, has perhaps hardly been surpassed. Another volume of a more elementary character on the same subject, containing in addition his more recent improvements and extensions of his calculus, was published after his death, which took place 2d September 1865.

While yet an undergraduate of Trinity College, Dublin, he was appointed, in 1827, successor to Dr Brinkley in the Andrews' chair of astronomy in the university of Dublin, to which is attached the astronomer-royalship of Ireland. In 1835, he was knighted on his delivering the address as secretary to the British Association for its Dublin meeting. He occupied for many years the post of president of the Royal Irish Academy, and was a member of most of the great scientific academies of Europe. He held during his life, not in Dublin alone, but in the world of science, a position as merited as it was distinguished.

HAMILTONIAN SYSTEM, a method of teaching languages, so called from the inventor, an English merchant of the name of James Hamilton, born about 1769. Having removed to Hamburg in 1798, he took lessons in German, on the understanding that he was not to be troubled with the grammar of the language. He and his teacher read together a German book of anecdotes, the pupil translating word for word after his teacher; and after twelve lessons, Hamilton found himself—so at least we are told—able to read an easy German book. His attention was thus drawn to the subject of learning foreign languages; and finding himself, after a life of vicissitudes, in the city of New York, about the year 1815, he wrote a treatise expounding his views, and commenced putting them in practice. He undertook to teach adults in fifteen lessons to translate the Gospel of St John from French into English, but found, we are told, ten lessons sufficient. After teaching for a time with great success in America, he returned in 1823 to England, and visited the chief cities, everywhere attracting crowds of pupils, notwithstanding that his system was denounced by many as quackery. He died in Dublin in 1831.

The Hamiltonian method was only one stage in the reaction—begun as early as the time of Comenius (q. v.), and carried on, among others, by Milton and Locke—against the pedantic method of beginning to teach a foreign or dead language by making the learner commit to memory a complete set of grammar rules before he had acquired sufficient practical acquaintance with the language itself in its concrete form, to give the rules any meaning. Hamilton's method of procedure may be shortly summed up as follows: Supposing Latin to be the language to be learned, Hamilton put into the pupil's hands the Gospel of St John in Latin, with an interlinear version, so literal as to shew the gender as well as the number of nouns, &c., and the mood, person, and tense of the verbs. The idioms were not translated by corresponding idioms, but each word by its literal equivalent in English. A fundamental point with Hamilton was to give the primitive, and not the derivative signification of the word, and to give the same signification to the same word in whatever connection it might stand. When the pupil had by this practice got a considerable knowledge of the vocables and accidence of the language, he was practised in turning the English version back into the Latin. Hamilton undertook in this way to give boys of eleven as much knowledge of Latin in six months as they usually learn at our public schools in six years. One obvious defect of this method is, that no language admits of a word-for-word and uniform translation into another; the method is in this respect misleading. Besides, one great use of learning languages is as a mental discipline, and in this point of view the Hamiltonian system is useless. It may be useful in the case of adults who wish to acquire, with as little labor as pos-

Digitized by Google

sible, a limited power of reading and speaking a language; and in any case, a language once begun to be learned on Hamilton's principles, may be afterwards prosecuted on a better method, thus avoiding the painful initiatory stages of the grammatical method. The necessity, however, of having recourse to the crude method of Hamilton, is superseded in the practice of most modern teachers, who contrive to make the practical and grammatical knowledge of a language go hand in hand.

HAMM, a town of Prussia, in the province of Westphalia, is situated on the left bank of the Lippe, 22 miles north-north-west of Arnsberg. It is surrounded by an old wall now converted into a promenade, and by a ditch; contains a castle, gymnasium, and college, and carries on the manufacture of linen extensively. Iron is also produced. H. was formerly one of the Hanse towns. Pop. (1875) 18,904.

HAMMER—STEAM-HAMMER—a tool used for applying the force of impact, either for the purpose of beating malleable materials into a required form, or for driving nails, wedges, &c. The common hand-hammer consists of an iron head, usually faced with steel, fixed crosswise upon a wooden handle. When one side of the head is thinned out of a wedge form or to a point, this is called the *pane* of the hammer. The *face* is the flat disc which strikes the work. Carpenters' and joiners' hammers have a bent pane with a V-shaped notch, which is used as a bent lever for drawing nails, &c. The pane is sometimes sharpened so as to form an adze or chisel. A multitude of other modifications in the form of hammers are made to suit different kinds of work. Some of the more important of these are treated under the heads of the various operations, such as FORGING, FILE-CUTTING, GOLD-BEATING, &c.

For many purposes, hammers are required of greater weight than a man can wield; and a great variety of power-hammers are used. These, for the most part, are masses of iron raised by steam or other power, and then allowed to fall by their own gravity upon the work. The *helve* or *shingling hammer*, used for compressing the mass of iron drawn from the puddling furnace, and the *tilt-hammer*, used in the manufacture of shear-steel, are important examples of such hammers. The first is a heavy bar of cast iron about ten feet long, weighing three or four tons and upwards, to which is attached a head of wrought iron faced with steel, weighing nearly half a ton more. It works upon an axis at the end of the bar furthest from the head, and is raised by cams attached to a heavy wheel set in motion by steam or water power; these cams strike or "lick" a projection extending beyond the head, and thus raise it about 18 or 20 inches at the rate of from 70 to 100 times per minute. The tilt-hammer is similar, but much lighter, and is adapted for striking above 300 blows per minute. In order to obtain this velocity, a short "tail" extends with a downward inclination beyond the axis, and the cams strike this downwards, and thus lift the longer arm of the lever to which the head is attached. These when worked by steam, as they usually are in this country, are, of course, steam-hammers; but when the term steam-hammer is used without qualification, it applies to another and more elaborate machine of very different construction, invented by Mr James Nasmyth in 1842, and subsequently modified and improved in some of its minor details. In this, the hammer is attached to the bottom of a heavy mass of iron, the "hammer-block," capable of rising and falling between upright bars or "guides;" this again, is fixed to the rod of a piston, which works in a cylinder placed perpendicularly over the hammer-block, hammer, and anvil. As the piston rises in the cylinder, it lifts the attached mass, which is then allowed to fall from varying heights, according to an adjustment which can be made by an attendant simply touching a handle. The adjustments are so perfect that it may be made to crush a mass of iron, and at the next blow to crack a nut held in the fingers without damaging either kernel or fingers, or to crack the top of an egg in an egg-cup, as might be done with the bowl of a spoon. The mechanism by which this is effected is too elaborate to be described here in detail. One novel contrivance, viz., the "latch," which reverses the action of the steam-valves at the precise moment required, is of remarkable ingenuity.

In the first "Nasmyths" that were used, the weight of the descending mass—viz., the hammer-block, hammer, &c.—was from thirty to sixty cwts., and they were justly regarded as mechanical marvels. Steam-hammers with a descending mass of twenty to fifty tons have since been constructed. In order to compare the

Digitized by Google

power of these with the "helve" or other hammers, which descend by angular motion on a pivot, it must be remembered that these latter, when formed of a straight bar, are only effective to the extent of a body of one-third of their weight falling directly from a corresponding height, on account of the fact that the whole bar forming the hammer is moving with a velocity varying from nothing at the axis to a maximum at the end of the bar, where the hammer-face is fixed.

HAMMER-BEAM, a portion of an open timber roof, forming a truss at the foot of the rafter, which gives strength and elegance to the construction. It looks as if there had been a tie right across, and the centre part being cut out, the remnants at each end form the hammer-beam. The end next the apartment is usually ornamented with shields, heads, pendants, &c.

HAMMER-CLOTH, a cloth which covers the driver's seat in some kinds of gentlemen's carriages. The term is believed to be a corruption of hammock-cloth, the seat which the cloth covers being formed of straps or webbing stretched between two crutches, as a sailor's hammock is suspended. Ease of motion, as in the case of springs, is the cause of this arrangement. Hammer-cloths are usually ornamented with fringes, and bear the arms of the proprietor of the carriage. They are old-fashioned, and now more seldom seen than formerly.

HA'MMERFEST, the principal town and trading port of Finmark (q.v.) in Norway, and the most northern town of Europe, is situated in 70° 40' n. lat., and 23° 30' e. long. Pop. about 2000. H. is situated in a barren treeless district in the rocky island of Kvaloe ("Whale Island"), and consists of one long street skirting a wall of rock. The harbor is good and presents a busy appearance during summer, when it is visited by some 200 vessels, which bring hemp, meal, potatoes, and other provisions in exchange for oil and fish (the staple commodities of the island), reindeer hides, eider down, and fox skins. During the two summer months the sun is continually above the horizon and the heat is very great, yet the winter, singular to say, is mild enough to allow of the fisheries being carried on. Copper from the works at Kaafiord, which have been in the hands of an English company since 1847, is also sent to England from Hammerfest. H. is the northern limit of the birch.

HAMMER-HEAD, or Hammer-Headed Shark (*Zygæna* or *Sphyrna*), a genus of fishes of the great family of Sharks; having the general form and characters of the family, but distinguished from all other fishes by the extraordinary form of the head, which in the adult resembles a double-headed hammer, being extended on both sides to a considerable length, and having the eyes at the ends of the lateral extensions. The mouth is below the centre of the head. The hammer-headed form is not nearly so perfect in the young as in the adults. It is supposed to be intended for enlargement of the sphere of vision. In the fœtal state the lateral extensions are doubled upon themselves. The hammer-heads are ovo-viviparous, and produce many (about forty) young at a birth. They are most abundant in tropical seas. In the Bight of Benin "they may often be seen ascending from the clear blue depths of the ocean like a great cloud." They are very voracious. Some of them attain a great size. One species (*Z. malleus*) has been taken on the British coasts. It attains a length of twelve feet or upwards. It chiefly belongs to the warmer parts of the Atlantic Ocean.

HA'MMERSMITH, a village of England, in the county of Middlesex, about six miles west-south-west of the London post-office, is situated on the Thames, which is here crossed by an elegant suspension bridge, completed in 1827, at the cost of £80,000. The grounds in the vicinity are occupied as nurseries and market-gardens, from which a large supply of flowers and vegetables is sent to the city. The parish church, a plain brick building with a low tower, was erected in 1631, and consecrated by Laud, then bishop of London. H. contains also the convent of the Good Shepherd, and, in connection with it, an asylum for penitent women. Near the Broadway stands the West London Hospital, supported by voluntary contributions. There is also a large endowed school, founded by a Mr William Godolphin, and which takes his name. The premises and grounds of the school-room cover upwards of four acres. Formerly, a detached village, and connected with London only in a commercial sense, H. is now joined to that city by continuous lines of street, and

Digitized by Google

forms essentially a portion of it. The parish of H. is traversed by six very important railways, two of which terminate here. Pop. of the parish in 1871, 42,691.

HAMMOCK, the apparatus in which a sailor slings his bed, derives its name through the Spanish *hamac*, from a Peruvian word; the custom of thus suspending a bed having been derived from Peru, where the natives fasten the two ends of a piece of canvas, or of a netting of grass twist, to the branches of a tree, and lie suspended on it in luxurious ease. A sailor's hammock consists of a rectangular piece of hempen cloth, about six feet long and three in width, gathered together at each end by means of cords and a clew, and hung to hooks under the deck. The hammock thus suspended forms a sort of bag capable of containing the sailor's mattress, his blankets, and himself, as soon as he has acquired the far from easy knack of climbing into it. The hammocks are taken below at sunset, and hung in rows, about two feet apart, in the men's portion of the ship. When done with in the morning, the bedding is carefully tied up within each, and the whole stowed in the hammock-netting, which is generally in the bulwarks of the waist. If the weather be not sufficiently dry, however, to allow of this, the hammocks are left below. Stowed thus in the netting, the hammocks form a strong barrier against small shot.

HAMMOND, Henry, D.D., a learned English divine and able controversial writer, the youngest son of Dr John Hammond, a physician, was born at Chertsey, Surrey, August 18, 1605. Educated at Eton, he was, in 1618, sent to Magdalen College, Oxford, where he sedulously applied himself to classical studies. In July 1625, he became a Fellow of his college, and in 1629 entered into holy orders. In 1633 he was presented to the rectory of Penshurst, in Kent, and in 1643 he became Arch-deacon of Chichester. H. followed the unfortunate Charles to the Isle of Wight, and continued with the king as his chaplain till his attendants were dismissed, in 1647; he then returned to Oxford, and was chosen sub-dean of Christchurch. In 1648, he was deprived of his college offices by the parliamentary commissioners, and shortly after retired to Westwood, in Worcestershire, the seat of Sir John Packwood, where the remainder of his life was spent in literary labor. He died April 25, 1660. His celebrated work, the "Paraphrase and Annotations on the New Testament," was published in 1653. A new and enlarged edition came out in 1656, but the best edition is that of 1702. His collected works were published, in 4 vols. folio, in 1674—1684. His sermons and minor works are reprinted in the Oxford "Library of Anglo-Catholic Theology."

HAMOO'N. See SEISTAN, LAKE OF.

HAMPDEN, John, a celebrated English patriot, said to have been born in London in 1594, was the son of William Hampden of Hampden, Buckinghamshire, and Elizabeth, daughter of Sir Henry Cromwell of Hinchingbrooke, Huntingdonshire, aunt of Oliver Cromwell. His father died in 1597, when he was only three years old. In 1609 he was entered a gentleman commoner at Magdalen College, Oxford, and in 1613 was admitted to the Inner Temple, where he made considerable progress in the study of law. On January 30, 1621, he first entered the House of Commons as member for the now disfranchised borough of Grampound. He attached himself to the party of St John, Selden, Coke, Pym, and those who opposed the arbitrary encroachments of the crown, but at first took no very forward part in public business, and spoke but seldom. In the first three parliaments of Charles I., he sat for Wendover. In 1627, for refusing to pay his proportion of the general loan which the king attempted to raise on his own authority, H. was committed to close imprisonment in the Gatehouse. Subsequently, he was removed to Hampshire, but, with seventy-six others, unconditionally liberated by an order of council. His activity and industry in parliament now rendered him one of its leading and most useful members; he was on most of its committees; but after the dissolution of the parliament of 1628—1629, he retired to his estate, and devoted himself to study and to country sports and occupations. Claiming the power to tax the country in any way he thought proper, in 1634, Charles had recourse to the impost of ship-money. At first limited to London and the maritime towns, and levied only in time of war, it was, in 1636, extended to inland places in time of peace, when H. resolutely refused to pay it, and his example was followed by nearly the whole county of Buckingham. In 1637, he was prosecuted before the court of Exchequer for non-

Digitized by Google

payment, when a majority of the judges gave a verdict against him. In the short parliament of 1640, H. took a prominent part in the great contest between the crown and the House of Commons. To the Long Parliament he was returned both for Wendover and the county of Buckingham, and made his election for the latter. For his resistance to the king's proceedings, he was one of the five members whom Charles, on January 4, 1642, rashly attempted in person to seize in the House of Commons; and on the breaking out of the civil war, he raised and became colonel of a regiment in the parliamentary army under the Earl of Essex. He was also a member of the Committee of Public Safety, and in the prosecution of the war, constantly advised prompt and energetic measures. He was present at the repulse of the royalists at Southam, at their defeat near Aylesbury, at the fight at Edgehill, and at the assault and capture of Reading. Prince Rupert having attacked a parliamentary force at Chinnor, near Thame, H. put himself at the head of a few cavalry that were rallied in haste to oppose him, and in the fight that ensued at Chalgrove Field, received in the first charge a wound, of which he died six days after, on June 24, 1643. He was twice married, and by his first wife had three sons and six daughters.

HA'MPSHIRE, SOUTHA'MPTON, or familiarly, Hants, a maritime county in the south of England, is bounded on the w. by Dorset and Wilts, on the n. by Berks, on the e. by Surrey and Sussex, and on the s. by the English Channel. The county, including the Isle of Wight, has an area of 1,070,216 acres, 900,000 of which are estimated to be under culture. Its population in 1861 was 431,495; and in 1871, 544,684. The surface is irregular, being traversed by the North and South Downs. The south-western portion of the county, almost wholly detached from the main portion by the Southampton Water, is occupied mainly by the New Forest. This tract is 64,000 acres in extent, is the property of the crown, and is valuable for the oak and beech timber obtained from it for the use of the British navy. Within the forest, an aboriginal breed of pony is still found. Besides that called the New Forest, there are also remains of those of Bére, Alice Holt, Woolmer, &c. The principal rivers are the Anton or the Test, and the Itchen, which flow southward through the county into the Southampton Water, and the Avon, also flowing southward, and forming the western boundary of the New Forest. The climate of the county is in general mild, and favorable to vegetation; indeed, the climate in the south of the Isle of Wight is supposed to be milder than that of any other portion of Great Britain. The soil consists in part of poor sands and gravel, and of a mixture of stiff clay and chalk. All the usual crops are produced, hops are cultivated, and the bacon cured here is famous. The manufactures of the county are inconsiderable. Southampton and Portsmouth, both termini of important railways, are the chief centres of trade. The county, exclusive of the boroughs and the Isle of Wight, sends four members to the House of Commons. The New Forest seems to have been fatal to the family of William the Conqueror: there two of his sons, and his grandson, met with sudden and violent deaths. Of the early ages of English history, H. contains many interesting relics; of these the chief are Porchester Castle, at the head of Portsmouth Harbor; Calshot and Hurst Castles, now occupied as coast-guard stations, erected in the time of Henry VIII., and Netley and Beaulieu Abbeys, and the Priory of St. Dionysius, all in the neighborhood of Southampton. The county is exceedingly rich in Roman remains, as coins, urns, pottery, &c. For further information on the antiquities and history of the towns of H., see articles WIGHT, ISLE OF; WINCHESTER, &c.

HA'MPSTEAD, a village of England, in the county of Middlesex, is finely situated on a range of hills four miles north-north-west of London. It was formerly famous for its medicinal springs, and is still a favorite place of residence and of holiday resort among Londoners, who are attracted to it by the beauty of its situation, and the purity of its air. On the summit of the hill, above the village, is the Heath, which affords extensive and pleasant prospects of the surrounding country. On the Hampstead road, and in the vicinity of the village, many handsome villas have been erected. Pop. (1871) 82,281. A house on the Heath, formerly called the Upper Flask Inn, and now a private residence, was at one time the place of resort of the famous Kit-Kat Club, at which Steele, Addison, Richardson, and others used to assemble. The village of H. was much frequented by Pope, Gay, Johnson, and Akenside, and later by Byron, Leigh Hunt, and Johanna Baillie.

HA'MPTON, a small village on the Chesapeake Bay, in Virginia, United States America, giving its name to Hampton Roads, a southerly branch of Chesapeake Bay, and mouth of James River, one of the best harbors on the American coast, defended by Fortress Monroe and Fort Calhoun. These roads were the scene of important events in the American revolution, the war of 1812, and the civil war of secession, especially of the first naval battle between iron-clad vessels, the *Virginia* or *Merrimac* and the *Monitor*. Pop. (1870) 2300; (1880) 2,684.

HA'MPTON, a village of England, in the county of Middlesex, is pleasantly situated on the left bank of the Thames, about twelve miles south-west of London. The streets are narrow, and the houses are irregularly built; in the vicinity, however, there are many noble mansions and beautiful villas. Pop. (1871) 2207.

HAMPTON COURT PALACE, long a royal residence, and now usually occupied by persons of rank, reduced in circumstances, stands about a mile from the village in the midst of grounds that extend to the Thames. The original palace was erected by Cardinal Wolsey, and came afterwards into the possession of Henry VIII., who enlarged it, and formed around it a royal park or chase, which he stocked with deer. Here Edward VI. was born, and here his mother, Queen Jane Seymour, died. Charles I. underwent a portion of his confinement at this palace, and it was the occasional residence of Cromwell, Charles II., and James II. A considerable portion of it was rebuilt by William III., and by him the park and gardens were laid out in the formal Dutch style. The palace, as it at present stands, consists of three quadrangles with some smaller courts; the great eastern and southern fronts having been erected by Sir Christopher Wren. The picture-gallery comprises Lely's Beauties of the Court of Charles II., valuable specimens of Holbein, Kneller, West, &c., and above all, seven unequalled cartoons by Raphael. The gardens, which are about 44 acres in extent, and have not been materially altered since they were laid out by William III., present a series of curious raised terraces, formal flower-pots, and long, shady and trim arcades. Among other attractions of the gardens is a "maze" or labyrinth, which furnishes much amusement to youthful visitors.

HAMPTON COURT CONFERENCE, a conference which took place at Hampton Court, shortly after the accession of James I. to the throne of England, in order to the settlement of ecclesiastical disputes. The king presided and took a principal part in the conference. He was attended by some of the nobility and highest officers of state, but no one seems to have been permitted to take any part in the proceedings except the king himself and the divines whom he had summoned. Of these, the representatives of the Episcopalian party were more numerous than the Puritans; and the Puritans, although men of known worth and learning, were among the least extreme of their party. Archbishop Whitgift, with eight bishops, six deans, and an archdeacon, appeared on the Episcopalian side; two Oxford professors of divinity, two divines from Cambridge, and along with them Mr Patrick, Galloway, minister of Perth, in Scotland, maintained the Puritan cause. On the king's accession, the Puritans, entertaining great hopes of release from the rigid enforcement of ceremonies which galled their consciences, and of the reformation of abuses in the church, had addressed a petition to the king, know as the "Millenary Petition," because it was signed by nearly one thousand ministers in all parts of the country. But the king's intention was not to comply with their wishes, and the Hampton Court Conference seems to have been merely a device for making it appear that their demands had been considered and found unreasonable. On the first day of the conference (12th January 1604), the Episcopalians alone were admitted to the presence of the king, who demanded their opinion, which they gave, on the third day after, in favor of the existing system in all the parts complained of. The king debated with them on some points; and in the end, decided against them in a few minor particulars, thus maintaining the assertion of his own ecclesiastical supremacy, as well as finding an opportunity for the display of his attainments in theology, although in all that was most important, his verdict was in their favor. On the 16th of January, the Puritans were called to the king's presence, but along with them some of the Episcopalians, when James debated keenly against the Puritans, using language very unworthy of a king or of a Christian, and according to his own account of the matter, "peppered them soundly." On the 18th of January, both

Digitized by Google

parties were called in, and the royal judgment intimated, which was afterwards announced in a proclamation very adverse to the Puritans.

HAMSTER, (*Cricetus*), a genus of rodent quadrupeds of the family *Muridæ*, resembling the true mice and rats in their dentition, but having check-pouches, and a short hairy tail. The COMMON H. (*Cricetus vulgaris*) is a native of the north of Europe and of Asia, abundant in many parts of Germany and Poland, but not found in Britain, and rare to the west of the Rhine. It is of variable color; although generally reddish gray above, the belly black, the feet white, and large white spots on the sides, throat, and breast. It is larger and of stouter form than the common rat, the tail only about three inches long. It burrows in dry soils, each individual making a burrow for itself, to which there are more entrances than one, and which also contains several holes or compartments, one of them lined with straw or hay, in which it sleeps, and some of them capacious enough for the storing of large quantities of grain or other provisions—to the amount of 60 pounds of corn or a hundredweight of beans—which the animal carries thither in its check-pouches, and on which it feeds during the milder parts of winter, spending the most severe part of that season in a state of torpid hybernation. It is a great pest to the farmers of the countries in which it abounds, and the object of their unceasing hostility; but it is very prolific, producing two or three broods in the year, and sixteen or eighteen at a birth. It feeds generally on vegetable food, as leaves, seeds, &c., although it is said also sometimes to devour small quadrupeds, birds, lizards, frogs, &c. The H. carries away pease and other legumes in pod, but shells them, and deposits only the edible portion in its store. Its labors and depredations are all carried on by night. It is an extremely fierce and pugnacious animal, and exhibits more than the pertinacity of the bull-dog. The skins of hamsters are of some value.—There are several other smaller species of the genus, mostly Asiatic.

HAN, the name of the most celebrated of the twenty-six dynasties of China (206 B. C. to 220 A. D.), founded by Kau-tsu, whose accession to the empire is regarded as the commencement of Chinese modern history. The number and character of its heroes and literati are superior to most other periods, and to this day the term *Sons of Han* is the favorite appellation of the Chinese to themselves—the most common term for Chinamen.

HA'NAPER OFFICE, a branch-office of the Court of Chancery, from which certain writs are issued. The name is derived from the fact that the papers and writs used to be kept in a hamper (*in hanaperio*).

HA'NAU, an industrious and flourishing town in the Prussian province of Hessen-Nassau, is situated near the confluence of the Kinzig and the Main, 12 miles east-north-east of Frankfurt by rail. It is divided into the Old and New Town, the latter of which was founded, in 1597, by Protestant refugees from Belgium, who introduced the manufacture of woollen and silken goods, which still flourishes. The town of H. stands pre-eminent in Germany for its jewellery, and gold and silver wares, while it also carries on extensive manufactories of carpets, gloves, leather, cards, paper, hats, cutlery, tobacco, and cigars. H. has broad and straight streets; the buildings most worthy of note are the ancient castle; a gymnasium, in which the Wetterau Library is located; and the electoral palace of Philippsruhe, famed for its orangeries, and once the property of Napoleon's sister, Princess Pauline Borghese. Pop. (1875) 22,730. In the neighborhood of the town, and on the left bank of the Main, are the baths of Wilhelmsbad and the village of Rumpenheim, with its palace and gardens. H. is celebrated as the scene of the last battles which Napoleon fought in Germany, October 30 and 31, 1813, when, in his retreat from Leipsic, after a hard-fought battle, he totally defeated the allies.

HA'NCHINOL (*Heimia salicifolia*), a plant of the natural order *Lythaceæ*, with lanceolate, frequently ternate leaves, and flowers on one-flowered stalks. It is a native of Mexico, and is much esteemed as a medicine for its very powerful sudorific and diuretic properties. It is highly extolled as an antisyphilitic.

HAND, The. The genus *Homo*, or MAN, takes rank in the classification of mammals as a distinct order, BIMANA, in consequence of man being the only animal possessing *two hands*. At first sight, it might be considered that four-handed animals—the monkeys, apes, and their allies, which are placed by zoologists in the order

Digitized by Google

QUADRUMANA—were superior to those which possess only two hands, but this is far from being the case. None of these four hands are adapted to the variety of actions which the human hand is capable of performing, and they are all, to some degree, required for support and locomotion; so that while in the higher forms of the quadrumana the extremities present an approximation in structure to those of man, in the lower they gradually tend to resemble the ordinary quadrupedal type. "That," says Cuvier, "which constitutes the *hand*, properly so called, is the faculty of opposing the thumb to the other fingers, so as to seize upon the most minute objects—a faculty which is carried to its highest degree of perfection in man, in whom the whole anterior extremity is free, and can be employed in prehension." The peculiar prehensile power of the human hand is chiefly dependent upon the length, power, and mobility of the thumb, which can be brought into exact opposition to the extremities of all the fingers, whether separately or grouped together.

Before describing the hand itself, we must say a few words on the upper extremity generally, of which the hand may be regarded as the essential part.

The general arrangement of the bones of the arm will be readily understood by a reference to fig. 1. The general plan of the osseous framework of the upper and lower limb is very similar. The *humerus* or arm-bone corresponds to the *femur* or thigh-bone; the lower end of the humerus is connected with the two bones of the forearm, the *radius* and the *ulna*, which correspond with the two bones of the leg. Then come the *carpal* bones, the *metacarpal* bones, and the *phalanges*, just as we have *tarsal* bones, *metatarsal* bones, and *phalanges* in the foot.

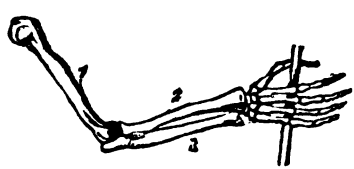

Fig. 1.

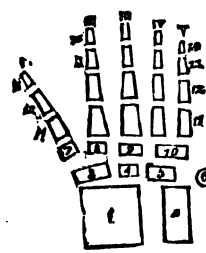

Fig. 2.

Fig. 1.—1, the humerus; 2, the radius; 3, the ulna. Beyond the distal ends of the radius and ulna come the carpal bones, the metacarpal bones, and the phalanges.

Fig. 2.—Diagram of the bones of the hand, with the ends of the radius and ulna. 1, end of radius; 2, end of ulna; 3, scaphoid; 4, semilunar; 5, cuneiform; 6, pisiform; 7, trapezium; 8, trapezoid; 9, magnum; 10, unciform; 11, 11, metacarpal bones; 12, 12, first row of phalanges; 13, 13, second row; 14, 14, third row; I, thumb; II, forefinger, &c.; V, little-finger.

In fig. 2 (which we copy from Humphry's "Human Foot and Human Hand") we have a diagram shewing the way in which the bones of the hand are arranged. The carpal bones (3 to 10 in the figure) are eight in number, and are arranged in the wrist in two rows. The first or upper row consists practically of three bones (3, 4, 5), the fourth (6) being regarded as belonging to the class of *Sesamoid Bones* (q. v.), and the second row of four bones (7, 8, 9, 10); so that, excluding the pisiform bone (6), the carpal and the tarsal bones correspond in number. As we commonly term the palm the *front* of the hand, the thumb becomes conventionally the *outer*, and the little-finger the *inner* digit; but according to the rules of comparative anatomy, and in order to compare the hand and foot, we ought to reverse these terms. The outer (3) of the

Digitized by Google

carpal bones of the first row supports (through the intervention of 7 and 8) the bones of the thumb and forefinger (I and II), and constitutes with them the *outer* division of the hand. The inner (5) of the carpal bones bears the little, and the next (the ring) finger (V and IV), and constitutes with them the *inner* division of the hand, while the middle one (4) bears the middle-finger (III), and belongs to the *middle* division of the hand. We likewise see from this figure, and likewise from fig. 1, that the two outer bones (3 and 4) are connected with the radius, while the inner bone (5) is connected (indirectly by a thick ligament) with the ulna.

It is unnecessary for us to enter into any anatomical details regarding the individual carpal bones. Collectively, they are so arranged that the carpus presents a dorsal convex surface, upon which the tendons of the extensor muscles of the fingers play, and a palmar concave surface on which the tendons of the flexor muscles lie. The several bones are joined to one another—each bone being united to three or more others—by a large extent of surface, and are girded together by strong ligamentous bands. The wrist is thus as strong as if it had been constructed of one solid piece of bone, while the slight gliding movements which occur between the several bones, give it an elasticity which serves to break the shocks that result from falls upon the hand. The uppermost surface of the first row of carpal bones is convex, and this convex surface is received into a wide cup or socket, formed by the lower articular surface of the radius, and by a ligament passing from that bone to the ulna.

The metacarpal bones and the phalanges require no special description. Like the great-toe, the thumb has only two phalanges, while each of the other digits has three.

We shall now notice the various movements of which the hand is capable. They may be divided into (1) the different directions in which the hand collectively can be moved; and (2) the movements of which the hand itself, without reference to the arm, is capable.

The *scapula* or shoulder-blade, with which the principal arm-bone articulates, is itself movable to a very considerable extent on the surface of the ribs on which it rests. Again, the socket in which the nearly spherical head of the *humerus* or arm-bone lies is very shallow—not unlike the cup in the well-known toy *cup-and-ball*—and the arrangements of the shoulder-joint generally are such as to permit so great a variety, and so extensive a range of movements, that we are able to apply the hand to every part of the body. This freedom of motion is due in a great degree to the clavicles or collar-bones, which by steadying the shoulder-blades, and keeping the shoulders apart, afford a fixed point for the various muscles which we employ in raising the arms, in folding them over the chest, in the act of hugging, &c. The movement at the next junction of bones, the elbow-joint, is very different from that at the shoulder. The latter is termed, from its construction, a ball-and-socket joint, and admits of motion in all directions, within definite limits; while the elbow is a hinge-joint, and merely admits of bending and straightening, or, in other words, of motion in one plane. We have next to consider a class of movements of the forearm and hand, to which there is nothing analogous (at least to any material extent) in the leg. The movements in question are called "pronation and supination." In *pronation* (derived from *pronus*, with the face downwards), we turn the palm of the hand downwards, as in picking up any substance from the table; in *supination* (derived from *supinus*, with the face upwards), we turn the palm upwards, as for the purpose of receiving anything that may be placed in it.

These movements of pronation and supination are so important to the usefulness of the hand, that we must notice the three muscles by which they are chiefly effected. One of the three muscles passes from a projecting process on the inner side of the arm-bone, at its lower end, to the outer edge of the middle of the radius. Its contraction causes the radius to roll over, or in front of, the ulna. It thus pronates the hand, and is called a *pronator* muscle. Another muscle passes from a projecting process on the outer side of the arm-bone to the inner edge of the radius near its upper part. It runs therefore in an opposite direction to the former muscle, and produces an opposite effect, rolling the radius and the hand back into the position of supination. Hence it is called a *supinator* muscle. The third is a very powerful muscle, termed the *Biceps* (q. v.), which not only bends the elbow, but from the mode in which its tendon is inserted into the inner side of the radius "also rotates

Digitized by Google

the radius so as to supinate the hand; and it gives great power to that movement. When we turn a screw, or drive a gimlet, or draw a cork, we always employ the *supinating* movement of the hand for the purpose; and all screws, gimlets, and implements of the like kind are made to turn in a manner suited to that movement of the right hand; because mechanicians have observed that we have more power to supinate the hand than to pronate it." Supination can only be performed to its full extent by man, and even in man it is not the natural or habitual position: monkeys can partially effect the movement, and in most of the lower animals the part corresponding anatomically to the hand is constantly in a state of pronation.

The movements of which the hand itself, without reference to the arm, is capable, are very numerous, and in this respect differ considerably from the corresponding movements of the foot. Thus we can bend the fingers down upon the palm, or we can extend them beyond the straight line; we can separate them from one another to a considerable extent, and we can close them with considerable force. The wrist and hand are bent forwards or flexed upon the forearm by three muscles which pass downwards from the inner condyle or expanded end of the humerus, and are termed the *radial flexor*, the *ulnar flexor*, and the *long palmar* muscles. The first two of these muscles are inserted into wristbones on the radial and ulnar sides respectively, while the third expands into a fan-like *fascia* or membrane in the palm of the hand, and thus serves both to support the skin of the palm and to protect the nerves and vessels which lie below it. Beneath the palmar fascia lie two sets of *flexor* muscles of the fingers, and they present so beautiful a mechanical arrangement as to merit special notice.

The *superficial* or *perforated flexor* muscle passes down the front of the forearm and divides into four tendons, which become apparent after the removal of the palmar fascia, and are inserted into the second phalanges of the fingers, each tendon splitting at its termination, to give passage to the similar tendons of the *deep* or *perforating flexor* muscle, which passes from the upper part of the ulna to be inserted into the last phalanx of each finger. These *flexor* muscles are antagonised by the *common extensor* muscle of the fingers, which, like the flexors, divides into four tendons, one for each finger. Besides these, there is a special *extensor* of the index-finger, a series of muscles forming the ball of the thumb, which move that organ in a most every direction, and various small slips giving lateral and other movements to the fingers.

It is sufficient to observe that the hand is very richly supplied with blood-vessels and nerves, without entering into any anatomical details on these points. There is no part of the body where the sense of touch is so acute as at the tips of the fingers, but we shall refer to the article TOUCH, ORGANS AND SENSE OF, the consideration of the special arrangements which make this part of the hand peculiarly important in relation to our knowledge of external objects.

Our notice of the comparative anatomy of the Foot (q. v.) renders it unnecessary to trace the modifications presented in the lower animals by the bones corresponding to those of the human hand; as the carpal and metacarpal bones with their phalanges undergo adaptations of form to meet the individual wants of the animal, very much in the same manner as the tarsal and metatarsal bones and their phalanges. Thus, the reader will readily see that the so-called knee of the horse, for example, is the carpus, and he will have no difficulty in tracing the metacarpal bones and phalanges. See the articles BROKEN KNEES and HORSE; and Humphry, "On the Human Foot and Human Hand."

HÄNDEL, George Frederick, one of the greatest of musical composers and musicians, though a native of Germany, spent so large a portion of his life in England, where he composed his greatest works, that Britain may almost claim him as her own. He was born at Halle, Upper Saxony, February 23, 1685. He manifested in infancy an extraordinary passion for music, and at the age of seven, having accompanied his father on a visit to the Duke of Saxe-Weissenfels, he found his way to an organ, where he was heard by the duke, who remonstrated with his father against further opposition to a genius of so decided a character. He was now placed under a music-teacher, Zachau, where he remained until he was 18, composing every week cantatas for the church-service, and learning all instruments, especially the organ. In 1698, he was sent to Berlin, where the Elector of Brandenburg was so impressed with his talents, that he wished to send him to Italy. As his father

Digitized by Google

would not accept this offer, he returned to Halle, whence, on the death of his father, he went to Hamburg in 1703. Here he played the violin in the orchestra of the opera. He was soon its director, and composed his first opera, "Almira," which was rapidly followed by "Nero" and "Florinda." His violent temper involved him in a quarrel with a brother-composer, which resulted in a duel; the sword of his adversary was stopped by a button or a music score. He next visited Italy. In Florence, he composed "Rodrigo," 1707. His "Agrippina," composed in Venice, had a run of thirty nights. At Rome, he was received at Cardinal Ottoboni's, where he heard Corelli, and beat him with his own violin, for not playing to suit him in his opera of "Il Trionfo del Tempo." In 1710, he returned to Germany, where he was appointed chapel-master to the Elector of Hanover, afterwards George I. At the close of the same year he went to England, where he was patronised by Queen Anne and the nobility. He composed "Rinaldo," "Pastor Fido," "Theseus" and in 1715, "Amadis da Gaula," in which Nicolini and Valentini first sung in England. In 1718 he undertook the direction of the Duke of Chandos's chapel at Cannons, where he wrote "Acis and Galatea," "Esther," the first English oratorio, and numerous concertos, anthems, fugues, &c. A Royal Academy of Music for the cultivation of the opera, was formed in 1720, and, after some competition, was placed under H.'s management. This undertaking, and other opera speculations, in which H. was engaged, proved very unsuccessful. H. lost £10,000, and was compelled to retire to Aix-la-Chapelle on account of his health. The oratorio "Deborah" was composed in 1733, and was followed by "Alexander's Feast" "Saul," "Israel in Egypt," and (1740) "L'Allegro'e Penseroso." In the end of 1741 he went to Dublin, where his "Messiah," composed in that year, was produced for charitable purposes. He remained in Dublin about nine months, and received a generous support. From this time success attended all his undertakings. On his return to London, he composed the "Samson;" and the "Messiah" was performed for the benefit of the Foundling Hospital. It was repeated annually for the same purpose, and from 1749 to 1777 brought to that charity £10,800. H. became blind, but he still composed, and played on the organ, being led to his seat, and forward to receive the plaudits of the audience. He assisted at the performance of one of his oratorios on the 6th of April, and he died as he wished, on Good Friday, the 13th of April 1759, "in hopes," he said, "of meeting his good God, his sweet Lord and Saviour, on the day of his resurrection." Among his works, which are in the Queen's Library, are 50 operas—8 German, 26 Italian, 16 English; 20 oratorios, a great quantity of church-music, cantatas, songs, and instrumental pieces. He was a wonderful musician, and his compositions are often full of grandeur and sublimity. His operas are seldom peformed, but his oratorios hold the same place in music that in the English drama is accorded to the plays of Shakspeare; and the Handel Festivals, lasting several days, are the grandest musical exhibitions of our times. See Chrysander's "Georg Friedrich H." (1858—67).

HAND-FASTING, the ancient term for betrothment, now disused.

HAND-GLASSES are very useful implements of gardening, for the protection of tender plants. They are of various kinds, some of them simple bells of glass, with a knob at top, for convenience of lifting them, chiefly used for covering cuttings in the green-house or stove, until they *strike* or send forth roots; whilst others consist of metal frames—zinc, lead, iron, or copper—filled up with panes of glass, and sometimes of a size large enough to be used for covering tree-pæonies, acacias, and other tender shrubs.

HA'NDICAPPING is the term used in various games and sports to denote the placing of competitors, good, bad, and indifferent, on such a footing that all shall have, as nearly as possible, an equal chance of winning. Thus, in horse-racing, when the speed of one horse has been ascertained to be greatly superior to that of another, the swifter of the two, in a handicap race, is made to carry extra weight to an amount that shall be deemed sufficient to reduce its speed to a level with that of its antagonist. Where the public performances of a horse have been exceptionally good, and when both speed and endurance are found to be of an unusually high character, the penalty inflicted in all future handicaps is very great, amounting sometimes to a weight several stones above that of very inferior competitors. The *beau idéal* of a handicap would thus be one in which the merits of the animals

Digitized by Google

should be so nicely discriminated, and the weights so accurately adjusted, that all the competitors should pass the winning-post at the same time, and thus run a "dead-heat." This is, of course, impossible in practice, but it is nevertheless the ideal at which the handicapper must aim; and the nearer he approaches to it, the more perfect is his work. In racing, no jockey with his saddle, &c., must weigh less than five stone seven pounds, but the maximum is left in the hands of the handicapper, who apportions to each horse a weight correesponding to its public performances, age, and sex. No appeal is allowed from his decision, nor can he be called upon to give the reasons that may have actuated him in allocating weights. Vested with such arbitrary power, he should be a person of sound judgment, unquestionable integrity, and thorough experience. His usual mode of constructing a handicap is to select the best and the worst horse entered for a race, placing such a weight upon the former as he supposes shall bring it down to a level with the latter's minimum of five stone seven pounds. He then proceeds to adjust the weights of the intermediate horses according to their varied merits.

When the handicaps have been published, no alteration can take place in the relative weights of the horses entered, unless one of these should prove a winner during the time intervening between the issue of the handicap and the period of its decision; in which case, extra weight, varying from three pounds and upwards, may have to be carried by the winning horse, as a penalty for his intermediate victory. Each jockey, with his saddle, &c., is weighed prior to starting, the exact extra weight to be carried being made up by leads strips let into the saddle-flaps. He is also weighed *after* the race, to prevent the possibility of his having carried either more or less than his proper weight; a precaution, moreover, that is rigorously observed after every kind of race, whether handicap or otherwise.

Though principally pertaining to horse-racing, handicapping is resorted to in many other sports. In pigeon-shooting from traps, the shooter stands, as a rule, 21 yards from the traps, that being the distance usually allowed to average performers. The more skilful the shooter, the further back has he to stand from the traps; the distance allowed by an acknowledged "crack" shot to his inferiors ranging from 1 to 10 or even 15 yards. In games such as chess and draughts, certain "men" are allowed to the inferior player; in billiards, the better of two allows his antagonist a certain number of "points," so as to equalise or handicap their respective games; at cricket, an eleven, such as the eleven of All England, will sometimes play against twenty-two others, the competition being at times very close. In swimming and pedestrianism, the inferior competitors are allowed a certain "law," or start; in yachting, the vessel of greater tonnage is handicapped with lesser ones, by allowing them extra time for the performance of the race. For instance, a fifty and a thirty ton yacht start for a race, the former allowing the latter, say, five minutes. They *start together*, and the heavier yacht reaches home, say three minutes ahead of the lighter; in that case, the lighter yacht's handicap of five minutes gives her the race by two minutes, though she was last to reach home. The principle of handicapping is the same, whether applied to field-sports or home amusements; it is the art of endeavoring to equalise, by certain penalties, the good, bad, and indifferent.

HAND-TREE (*Cheirostemon platanoides*), a large tree of the natural order *Sterculiaceæ*, which receives its name from the peculiar appearance of its flowers. These have no corolla, but a large 5-lobed and angular colored calyx—bright red within—from which project the five stamens, united by their filaments into a column, and separating and curving at the summit, where they bear the anthers, so as to have some resemblance to a hand or claw. It is not merely this, however, which makes the tree an object of interest, but the circumstance that it is an object of superstitious veneration to the Mexicans; a single tree near Toluca, which is mentioned in the earliest histories, being asserted by them to be the only one in the world, and their eager gathering of its flowers always preventing its multiplication by seed. It was not till 1801 that cuttings were obtained from it for the Botanic Garden of Mexico, where the young plants have since produced seed abundantly. The tree has also been found in great abundance in Guatemala. It is a lofty tree with a thick trunk, a habit similar to that of a plane, and broad maple-like leaves.

HANDS, Imposition of, a ceremony which has been employed both in ancient and modern religions use as symbolising the conferring of certain interior, and

Digitized by Google

generally speaking, spiritual gifts. In the consecration of Aaron and his sons, they are directed to lay their hands upon the heads of the victims which were to be offered in sacrifice (Ex. xxix. 10, 15, 19). Moses set Joshua apart as the leader of the people by "laying his hands upon his head" (Num. xxvii. 23). Our Lord is entreated to heal the ruler's daughter (Matt. ix. 18) by the same ceremony. This is the rite which He himself adopts in blessing the little children (Matt. xix. 15). The gift of the Holy Ghost was imparted by the same ceremony (Acts viii. 17), and the ministers placed by the apostles in the newly founded churches were similarly installed (1 Tim. iv. 14). In the early church, the rite of imposition of hands was employed in the receiving of catechumens and the reconciliation of penitents. From its use in confirmation, that rite is commonly designated by the Fathers under the name of Imposition of Hands. In the ancient church, this rite existed in two forms: the actual laying on of hands, which was called *chirothesia*; and the extending the hand over or towards the person, which was styled *chirotonia*. In the Roman Catholic Church the former is retained as an essential part of the sacraments of confirmation and holy orders; the latter is employed in the administration of the priestly absolution. Both forms are familiarly used in blessing. In the mass, also, previous to the consecration of the elements of bread and wine, the priest extends his hands over them, repeating at the same time the preparatory prayer of blessing. See Wetser's "Kirchen-Lexicon," vol. iv. 853. The rite of imposition of hands is used both by the Episcopalian and Presbyterian churches in the ordination of ministers. It also forms part of the ceremony of confirmation in the Anglican and in the Lutheran church. See Palmer's "Antiquities of the English Ritual," Keeling's "Liturgiæ Britannicæ."

HANDSEL, sometimes used to denote earnest-money, or part-payment, by way of binding a bargain. In Scotland, it popularly signifies a first transaction in trade, as, for example, the first sale effected in the day or week; and is likewise employed to signify a present in the nature of a New Year's gift on the first Monday in the year—hence called Handsel Monday.

HANDWRITING, in Law, is proved by calling a witness who either saw the individual write the identical words, or who by correspondence, or by having previously at other times seen the same person write other papers, can swear that he believes the paper is the handwriting of the individual to whom it is attributed. Sometimes, where no direct evidence can be had, engravers and others accustomed to compare the niceties of handwriting are allowed to give their evidence, or rather state their belief as to the writing; but this kind of evidence is looked upon with great suspicion, and is much discountenanced. In cases where a jury are called upon to determine a disputed question of handwriting, they are now allowed in England to form their own opinion by comparing the disputed writing with other writings admitted to be by the same party. This could not be done before 1854, but it is done now in both and criminal and civil cases. In Scotland, a jury may also be allowed to judge of the handwriting in this way in any case. In some countries—as, for example, in Scotland—a will, if written in the testator's handwriting, is admitted to be genuine without the attestation of witnesses, being then called a Holograph (q. v.) instrument; but there is no such privilege in England or Ireland, as all wills, by whomsoever written, must be attested by witnesses.

HANG-CHOW-FOO, the capital of the province of Che-keang, in China, on the left bank of the Tsien-tang, where that river disembogues into the Bay of Hang-chow-foo, is situated at the commencement of the Grand Canal, in lat. 30° 18′ n., long. 120° 15′ e. It is about 150 miles south-east of Nankin. H. is the most magnificent city of China—a Chinese proverb makes it a heaven upon earth. It was the capital of the empire during the rule of the Mongols, when it was visited by the celebrated Marco Polo early in the 14th century. There are ten gates through its lofty walls, which are 20 miles in circumference, but there are more inhabitants without the *enciente* than within. The population is estimated by Dr Macgowan at 800,000. The streets, which are of greater width than is usual in Chinese cities, are well paved, and in some directions lined for miles with elegant shops and extensive warehouses. The terminal ramifications of the Grand Canal are spanned by countless elegant bridges. H. is celebrated for its silk manufactures, and its embroidery excels that of any part of China. Mulberry-trees occupy every vacant spot within

Digitized by Google

and without the walls. No city in China, unless it be that of Suchau, possesses wealth to compare with that of this remarkable place, which, moreover, is the most literary and most religious part of the empire. Colleges and temples, *literati* and priests, abound and flourish in Hang-chow-foo. The imperial library in the palace of Kienlung, and the literary institutions, appear, however, to be going to decay, and could not at any period have had much educational influence. One cause of the celebrity of the city is found in the beauty of its environs. The tower of the Thundering Winds, although in ruins, is still an imposing edifice; while monumental gateways, light airy bridges, and temples of the size of villages, render the natural beauties of the city highly picturesque. One of the temples possesses 500 images of the Io-han (Buddhist saints), of the size of life, richly covered with gold. Nothing can exceed the beauty of the valleys opening into the lake, richly adorned as they are with trees, chiefly the camphor and tallow trees, and the arbor vitæ. From a remote period, these scenes have been the resort of pilgrims, and every spot is hallowed by some legendary incident. At one place there is an image of Buddha, cut out of the solid rock, measuring 48 feet from shoulder to shoulder. The nose is seven feet long, and the other parts are of a proportional size; it is gilt over like wooden and clay images of the same personage. The protruding rocks are profusely carved with religious inscriptions and images of mythological characters. The N.E. section of H. is called the Tartar city, being exclusively devoted to the Mantchu garrison or military colony. It is separated from the Chinese city by a low wall. About 25 miles below the city is Kaupoo, once a mart of considerable importance, the port of H., when that city was the metropolis of China, described by Marco Polo as an extremely flourishing place; fluvial changes have rendered it inaccessible to any but small flat-bottomed vessels. Chapoo, about 50 m. distant, situated on the n. of the bay, is now the port of H. Chapoo has also a Tartar city; it communicates by branches of the Grand Canal with H. and Shanghai. It is the port to which Chinese trade with Japan is restricted. H. suffered considerably at the hands of the rebel Tae-pings (q. v.), by whom it was captured.

The configuration of the Bay of Hang-chow-foo and the embouchure of the Tsien-tang river, which empties into it near the provincial capital, favors the formation of the tidal phenomenon designated an eagre or bore. See BORE. Dr Macgowan, the first European who had witnessed this magnificent spectacle, has published an account of it in the "Proceedings of the Asiatic Society of Hong-kong." As the tide rushes into the mouth of the river, it becomes elevated to a lofty wave, which attains its greatest magnitude opposite the city of Hang-choo-foo. Generally, there is nothing remarkable in its aspect, except at the period of the vernal and autumnal equinoxes, the maximum being at the latter season. As the hour of flood-tide approaches, crowds gather in the streets running at right angles with the river, but at safe distances; boatmen stop lading and unlading their vessels, and put out into the middle of the stream. The centre of the river teems with craft. Loud shouting from the fleet announces the appearance of the flood, which seems like a glistening white cable stretched athwart the bay as far down as the eye can reach. Its noise, compared by native poets to that of thunder, speedily drowns that of the boatmen; and as it advances with prodigious velocity, it assumes the appearance of an alabaster wall, or rather of an advancing cataract four or five miles across, and about 30 feet high. As the foaming wall of water dashes impetuously onward, one trembles for the safety of the floating multitude. They cease shouting, and devote their energies to the steadying of the prows of their vessels toward the advancing wave, which threatens to submerge everything afloat; but they all vault as it were to the summit with perfect safety. This grand and exciting scene is but of a moment's duration; the wave passes up the river in an instant, but from this point with gradually decreasing force, volume, and velocity, disappearing entirely a few miles above the city. From ebb to flood tide, the change is almost instantaneous: a slight flood continues after the passage of the wave, but it soon begins to ebb. Within the historic period, numerous changes have been effected by the action of this wave, the most noted being the removal of a rocky islet from the centre of the river opposite Hang-chow-foo. Chinese ingenuity has been long exerted, with imperfect success, in preserving the alluvial plain from the wasting action of the eagre. The history of the dykes that have been successively erected, of failures and disasters, found in the local annals, shew that,

Digitized by Google

like the Yellow River, this part of the Tsien-tang has been a constant source of anxiety and expense to the government, costing about 180,000 dollars per annum.

HANGED, Drawn, and Quartered, the description of the capital sentence on a traitor, which consisted of drawing him on a hurdle to the place of execution, and after hanging him, dividing the body into quarters. This punishment was substituted by the stat. 54 Geo. III. c. 146, for the ancient more barbarous sentence of disembowelling alive, but the crown has power to reduce the sentence to simple beheading. See also HANGING.

HANGING is the mode by which capital punishment is carried out in the United Kingdom. In England, formerly, in atrocious cases, it was usual for the court to direct a murderer to be hung upon a gibbet in chains near the place where the crime was committed—also at a later period to order the body to be dissected—and the execution to take place on the next day but one after the sentence was passed. But these useless severities were abolished by the stat. 6 and 7 Will. IV. c. 30.

The mode of punishing by hanging was first adopted in England in 1241, when Maurice, a nobleman's son, was hanged for piracy. Other more barbarous modes of inflicting death were long in use, being prescribed by statute, but have been abolished, and hanging has long been the ordinary, because the most humane, mode of executing capital punishment. In treason, hanging is part of the statutory punishment, coupled with mangling the body, though the crown may change the sentence into simple beheading, except in the case of women, who are only hanged, in deference to their sex. Formerly, in Scotland, on the other hand, a capital sentence pronounced south of the Firth of Forth could not be executed within less than 30 days; and if pronounced north of the Firth, within less than 40 days after it was pronounced. But now, in both cases, the day of execution must not be less than 15, nor more than 21 days, south of the Firth; nor less than 20, nor more than 27 days, if north of the Firth, after sentence passed. Until recently, the hanging or execution took place in public. See EXECUTION.

The cause of death in hanging is complex. The compression of the windpipe by the cord, the obstruction of the return of venous blood from the head, and of the flow of arterial blood to the brain, the stretching or tearing of the nervous structures of the neck, and in some instances dislocation or fracture of the vertebræ, may concur in the production of the fatal effect, which, though attended with violent struggles in some cases, is probably as nearly instantaneous as possible. The subject, in its relations to medical jurisprudence, will be more fully considered under the title STRANGULATION.

HANGING GARDENS. The Hanging Gardens of Babylon were anciently reckoned among the wonders of the world. Their construction is variously ascribed to Queen Semiramis, and to Nebuchadnezzar—seven centuries later, but still more than five centuries B. C.—who is said to have made them for the gratification of his Median queen, Amytis, because the Babylonian plain seemed dreary to her in comparison with the varied and romantic scenery of her native land. Diodorus and Strabo have given particular descriptions of them; and although it is remarkable that they are not mentioned by Herodotus, while Quintus Curtius speaks of them as "fabulous wonders of the Greeks"—an opinion which some of the learned in modern times have adopted, denying their very existence—yet the probability seems to be in favor of the general accuracy of the descriptions, and even that the ruins of this celebrated structure are to be recognised among the mounds, which mark the site of Babylon. See BABYLON. The Hanging Gardens are said to have formed a square, with an area of nearly four acres; but rising in terraces curiously constructed with stone pillars, across which were placed stones, covered with reeds and bitumen, and again with bricks united by cement; above these, sheets of lead, to prevent moisture from flowing down, and finally a sufficient layer of earth; the summit being elevated three hundred feet above the base, so that at a distance the whole presented the appearance of a pyramidal wooded hill. There was a large reservoir at the summit, which was filled with water by pumping from the Euphrates, for the irrigation of the gardens, and the supply of their numerous fountains. Fountains and banqueting rooms were distributed throughout the numerous terraces; groves and avenues of trees, as well as parterres of flowers, diversified the scene; whilst the view of the city and neighborhood was extensive and magnificent.

HANKOW' in lat. about 30° 30' n., and long. 114° e., a port of China, at the junction of the Han river with the Yang-tze-kiang, 600 miles from its mouth. It consists of three cities, the principal being Wu-chang-foo, on one side of the Han river, and Han-yang-foo on the opposite side. Strictly speaking, H. is a suburb of the former. It was destroyed during the Tae-ping rebellion, but has since been rebuilt, and has a population of from 500,000 to 1,000,000. English and American steamers ply regularly and frequently between H. and Shanghai. Vessels of large size can reach the city; the river is navigable 360 miles higher up, to the city of Ichang. Powerful flat-bottomed steamers are requisite for navigating this part of the Yang-tze-kiang, the current running at from seven to eight knots per hour. The principal export is tea. Other native products exported are silk, oil, tallow, tobacco, and wax. The chief imports are cotton piece-goods, woollens, metals, Straits and Japanese produce. The value of the exports, in 1870, was £4,434,129; and in 1871, £5,578,258; of the imports, in 1870, £5,938,314; and in 1871, £6,756,681. In 1875 the exports and imports were respectively valued at £5,662,094 and £4,858,810.

HA'NLEY, a town of Staffordshire, England, in the district known as *The Potteries*, and included in the parliamentary borough of Stoke-upon-Trent (q. v.). It is two miles and a half from Newcastle-under-Lyme, about one mile from Stoke, and one mile from the North Staffordshire Railway station and canal offices. The principal portion of the town has an elevated site. The streets are not very regular, but they are wide and well paved; and many of the houses are well built. There are several commodious market-places. There are numerous places of worship of the Church of England and other denominations. Among the public institutions is an infirmary.—Contiguous to H. is SHELTON, which may be regarded as forming with it one town. The manufacture of earthenware and china is the principal employment of the inhabitants of both. At Shelton is a villa called Etruria, erected by Josiah Wedgwood, remarkable for the Etruscan vases with which it is ornamented, imitations of ancient vases found in Italy, and the study of which was of great use to him in his endeavors to improve the manufacture of earthenware. The pop. of H. in 1871 was 39,976.

HANNIBAL (*the gift of Baal*) was a common name among the Carthaginians, the list of those famed in history extending to fourteen or fifteen. But the greatest of all the Hannibals was the famous son of Hamilcar Barca. He was born in 247 B.C. When he was nine years old, he accompanied his father on his Spanish expedition; and before starting, swore that oath of eternal hatred to the Roman name, which he kept so faithfully throughout his whole life. After the death of Hamilcar, he was employed by Hasdrubal, his brother-in-law, in most of the military operations which he undertook. Such was the esteem in which he was held by the soldiers, and such a reputation for bravery and strategic skill had he gained, that when Hasdrubal was assassinated, the army with one voice elected him commander-in-chief, an appointment which the authorities at Carthage at once ratified. H., at this time in his 29th year, undertook the command with ready zeal, for he longed to realise the legacy left him by his father, and to strike a death-blow at his country's rival by attacking her on her own soil. But before he entered on a task of such magnitude, he deemed it prudent to complete the subjugation of Spain, and accordingly spent two years in contests with some tribes hitherto independent of Carthage. Saguntum, a city in alliance with Rome, was attacked by him on the ground that its inhabitants were making aggressions on the Torboletes, subjects of Carthage. After a siege of eight months, the city was taken; and the Romans after an embassy had unsuccessfully demanded the surrender of the general who had thus wantonly violated the treaty, declared war in 218 B.C. Having taken measures for the defence of Africa and Spain during his absence, he started from New Carthage in 218 B.C., with 90,000 foot, and 12,000 horse. This force was very much thinned by his contests with the tribes between the Iberus and the Pyrenees, by the necessity of leaving Hanno with 11,000 men to keep them in subjection, by desertion in the passage of the Pyrenees, and by his sending home a portion of his Spanish troops. His object in this last act was to inspire the soldiers with thorough confidence in themselves and their general. From the Pyrenees he marched to the Rhone without opposition, since Scipio was at Massilia (Marseille), four days' march from the point where H.

Digitized by Google

crossed the river in the face of the Celtic hordes who sided with the Romans. His next great difficulty was the passage of the Alps, which he effected in fifteen days, in spite of the attacks of the mountain tribes, the snows, storms, and other difficulties. Much discussion has taken place among learned men whether H. crossed the Cottian Alps by the pass of Mont Genevre (or Cenis), or the Graian Alps by the pass of Little St. Bernard. For the former route, Michelet, Thierry, and most French writers argue; and for the latter, with better reasons, Niebuhr, Arnold, Mommsen, &c. After allowing his army (now about 26,000 strong) some time to recruit in the rich villages of the friendly Insubrians, he first subdued the Taurini, a tribe hostile to the Insubrians, and took their chief city after a siege of three days; and thus forced into alliance with him, all the Ligurian and Celtic tribes on the upper course of the Po. Scipio, having returned from Massilia, took the command of the army in the north of Italy, and first met H. on the plain near the river Ticinus. The Romans were entirely routed; and Scipio, who was severely wounded, retreated across the Po. The armies again met at the Trebia, with a like result, though the Romans, who had received reinforcements, were much more numerous. These battles were fought in 218 B.C. Having wintered in the neighborhood of the Po, and levied additional troops among the Gauls, most of whom were now his friend, H. started southward so soon as spring permitted, marching through Liguria and the swamps of the Arno. In this difficult route, immense numbers of his beasts of burden and horses perished, and he himself lost the sight of one eye. He next inflicted a severe defeat, near Lake Thrasymene, on the consul Flaminius: thousands perished by the sword, including the consul, and thousands in the lake, while 15,000 were taken captive, Hannibal losing only 1,500. After this victory he crossed the Apennines to Picenum and Apulia, and thence re-crossed to the fertile Campania, which he ravaged. Thither Fabius was sent with an army to oppose him, but no general engagement took place, the consul endeavoring to lead H. into snares, which he succeeded in doing; but the wily African extricated his army by a stratagem, and returned to Apulia. He wintered at Cannæ, and in June, or, according to others, in August (2d) of 216 B. C., almost annihilated a Roman army of 90,000 men under Terentius Varro and Æmilius Paulus, in the battle, which was fought a little below the town. About 50,000 are said to have fallen, including Æmilius Paulus, and a host of Roman knights, senators, and other distinguished persons. Here H. committed, perhaps, the greatest military error of his life, in not marching direct to Rome; but it is supposed that he refrained, in order to allow the tribes of Italy to declare in his favor. Many in the south of Italy did attach themselves to his interests, but not in such numbers as he had anticipated. After some delay, he marched on Neapolis (Naples), which he did not succeed in taking, but the gates of Capua were opened to him, and here he wintered. The enervating effect which the luxury of Capua is said to have had on his army has been greatly overdrawn, but his residence there forms, in one point of view, the turning-point in the war, which from this time became more of a desultory kind. H.'s great purpose was to arm the Italian nations against Rome, and so to crush her power by means of her own subjects; the Romans, on the contrary, henceforth avoided coming to a pitched battle with the Carthaginians, but sought rather to keep the tribes in awe, and harass H. and his lieutenants by small armies in different parts of the country. H. traversed Italy in all directions, surprised the Roman generals, defeated their armies, captured their towns, such as Casilinum, Arpi, Tarentum, Metapontum, Thurii, Locri, and many others; he defeated Centenius near Capua; Cn. Fulvius at Herdonea; Fulvius Flaccus on the Anio; Crispinus and Marcellus in Lucania; and the besieging army before Locri: in all these cases the armies were almost annihilated. The defeat of Hasdrubal, his brother, at the river Metaurus, and the loss of his army, compelled H. to confine himself to the mountainous peninsula of Brutium, where for four years he resisted all the efforts of the Romans to dislodge him. At length, after having maintained himself in Italy for upwards of fifteen years, he was recalled to Africa, to defend his country against Scipio; but notwithstanding his utmost exertions, and the bravery of his veteran troops, he was defeated by Scipio, near Zama, with a loss of 20,000 men. Peace was concluded in the following year (201 B. C.).

H.'s darling scheme had in the meantime been baffled, but his hatred to Rome was not diminished, and accordingly he set himself with all his zeal to make prepar-

Digitized by Google

ations for a still more deadly struggle at some future day. He turned his attention, in the first place, to political reforms, and some constitutional changes which were loudly called for, by which he placed the finances on a better footing. But his enemies accused him to the Romans of stirring up Antiochus III. of Syria to make war on them; and when ambassadors came to Carthage, H. fled to the court of Antiochus at Ephesus. In the war which followed, he took no conspicuous part, but the king bitterly regretted afterwards that he did not take the advice of H. to carry the war into Italy. When peace was concluded, the surrender of H. was one of the conditions; but foreseeing such a result, he fled to Prusias, king of Bithynia, for whom he gained a naval victory over Eumenes, king of Pergamus. He was at length demanded by the Romans; and seeing no hope of escape, he took poison, which he always carried with him for such an emergency.

Among ancient authorities, the reader may consult, with great profit, Polybius, Dion Cassius, Plutarch, and Appian; and of modern historians, Arnold's "Hist. of Rome," vol. iii.; Niebuhr's "Lectures on Roman History," vol. i.; Mommsen's "Hist. of Rome," vol. ii. (Dickson's translation). For military operations specially, see Vaudoucourt, "Histoire des Campagnes d'Annibal en Italie."

HA'NNIBAL, a city in Missouri, United States America, on the west bank of the Mississippi, 132 miles above St Louis. It is the terminus of the Hannibal and St Joseph and other railways, and has steamboat communication with various towns on the Mississippi. It has a large trade in pork, tobacco, hemp, and grain, with mills, foundries, and machine-shops. It has a college. Pop. (1870) 10,125; (1880) 11,074.

HANNO (perhaps the father or the son of that Hamilcar, who fell at Himera in 480 B.C.) is famed for a voyage of discovery which he made along the west coast of Africa, to found Libyo-Phœnician towns. His expedition is said to have consisted of 60 ships and 30,000 men and women. One city was built not far from the Strait of Gibraltar, and others along the coast reaching to Cape Bojador. He went south as far probably as Sierra Leone. On his return to Carthage, he inscribed an account of his voyage on a tablet, and placed it in the temple of Kronos (Saturn), or, according to others, of Juno. It seems to have been written in the Punic language; the version of it which remains is only a Greek translation. The "Periplus" has been published on the continent by Gelenius, Boecler and Müller, and Berkel, and an English translation by Falconer (Lond. 1797). Great discussions have taken place among the learned as to the *time* when H.'s voyage was made (the best authorities favoring the period of about 570 B.C.); as to *the* Hanno out of all the many Hannos of history; and as to the facts stated in the "Periplus;" but on these we cannot enter. Some recent writers find evidence in it of the existence of the *gorilla* in those ancient days. For a full discussion of the subject, consult Dodwell's Dissertation (in Hudson's "Geographi Minores"); Bougainville's Essay ("Mém. de l'Acad. des Inscript.," xxvi. p. 10, and xxviii. p. 260); also Falconer, in his edition already referred to.

HA'NOVER, a town in New Hampshire, United States America, pleasantly situated on the east bank of the Connecticut River, 52 miles north-west from Concord. It is the seat of Dartmouth College, founded by Lord Dartmouth for the education of the Indian youth, and a medical college. Pop. of township (1880) 2,147.

HANOVER, formerly a kingdom of Northern Germany, but since 1866 incorporated with Prussia. (The following description refers chiefly to the state of things before the union; for more recent information, see PRUSSIA.) Hanover extends from 51° 18′ to 53° 52′ n. lat., and from 6° 48′ to 11° 35′ e. long. It may be divided into three distinct districts, viz.—1. The eastern, which consists of the duchy of Bremen cum Hadeln, a section of the duchy of Lauenburg, the duchy of Verden, the principalities of Lüneburg, Kalenberg, and Hildesheim, and the countships of Hoya and Diepholz; 2. The western (separated from the former by the principalities of Oldenburg) comprises the duchy of Aremberg-Meppen, the principalities of Lingen, Aldenburg) comprises the duchy of Aremberg-Meppen, the principalities of Lingen, brück and East Friesland with the Harlingerlands, the lower countships of Bentheim and Bentheim, and the circle of Emsbühren, which formerly belonged to the Münster; 3. The southern, which is separated from the other Hanoverian territories by Brunswick, and comprises the principalities of Grubenhagen and Göttingen together with the districts of Elbingerode and Ilfeld. H. is bounded n. by the

Ocean and the river Elbe, e. by Mecklenburg and Prussian Saxony, s. chiefly by Westphalia and Hesse Cassel, and w. by Holland. The following table shews the divisions, or landrosteien, of H., with their respective areas and populations:

Landrosteien, or Provinces.	S. Area in Sq. Miles.	Population in Dec. 1858.	Chief Towns.	Population.
Hanover	2300·13	354,763	{Hanover, with subs.,	61,852
Hildesheim	1706·56	360,801	Hildesheim,	16,800
Lüneburg	4293·45	358,701	Lüneburg,	12,600
Stade	2595·60	288,975	Stade,	6,000
Osnabrück	2388·33	258,797	Osnabrück,	12,800
East Friesland, or Aurich	1144·08	189,068	Aurich,	4,792
Clausthal, and Mines of Goslar	241·92	32,946	Clausthal,	14,000

In 1858 the area was accordingly a little over 14,670 sq. m.; pop. 1,844,976. Area of the Prussian province of H., 14,800 sq. m.; pop. (1875) 2,018,868.

Physical Character, etc.—The general physical character of H. is that of an extended plain with slight undulations, but in the south the country is mountainous, embracing a considerable part of the Harz, together with the lesser heights of the Eichsfeld, Sollinger, Süntel, Deister-Oster, and Hildesheimer-Wald. From the base of these hills to the seacoast the land is one vast plain, only interrupted at certain points by low ranges of hilly ground. The mountains, which abound in minerals, are covered with dense woods, and the valleys lying between them are fertile and well adapted to agriculture; but beyond these valleys the country is traversed from east to west by a sandy tract from 50 to 80 miles in width, known as the Lüneburg Heath, in which the inhabitants with difficulty gain a scanty subsistence by rearing sheep and keeping bees. Great marshes or peat moors cover the north and north-west districts, but these have in some parts been so successfully drained that they yield good pasture, although the soil generally is unproductive, comprising some of the poorest districts of Germany. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dykes, the land being in many parts below the ordinary level of the sea. Along the banks of the rivers there are fertile districts, even in the north of the country.

The principal rivers are, the Elbe, which forms 120 miles of the north-east boundary-line; the Weser, on whose affluent the Leine, the capital of H., is situated; the Aller, the Ems, and the Vechte, which all fall into the German Ocean. There are numerous small lakes in Hanover. The principal canals are those between Lingen and Meppen, Aurich and Emden, and the Bremen Canal, between the Hamme and the Swinge, which serves to drain the moors, and to transport the turf and peat which they yield.

Climate.—The climate is moist near the ocean, and fogs and heavy winds are frequent; in the south it is dry and colder; and in some parts of the country marsh fevers prevail, although the general character of the climate in H. may be characterised as healthy. The mean annual temperature is 46°·5; winter, 28°·7; and summer, 64°·5. Extremes are rare. The average annual fall of rain is 28 inches.

Soil, Products.—The soil is generally of inferior quality, although it varies considerably in different districts. Agriculture is in a very backward condition, and notwithstanding some improvements which have been made of late years, large tracts of land, which are well adapted for cultivation, lie waste in every part of the country. The great subdivision of the land, and the consequent absence of capital, are the main causes of this imperfect mode of agriculture. The following proportions are given by Marcard for the distribution of the land in Hanover. Arable, meadow, and garden land, 5,833,000 morgen (the morgen is 0·6310 acre); forests, 2,242,000; waste lands, 6,514,000.

The richest corn-growing districts are Hildesheim, Göttingen, and Kalenberg, and the marsh-lands near the Elbe and Weser; rye is grown for the purpose of making bread, and largely used by the rural population. The turf obtained from the peat-moors in the north and north-west districts constitutes the only kind of fuel used in some parts of the country, and is obtained and consumed in very large

Digitized by Google

quantities. Cattle, horses, and geese are extensively reared in East Friesland and the marsh-lands; and barley and oats are raised in sufficient quantity for exportation.

The Luneburg and other extensive heaths afford good sheep walks, and when the heather is in blossom, are resorted to by the keepers of bees, who tend their hives with much care and considerable success. In 1869 there were 213,870 hives, chiefly in the Luneburg district, yielding honey to the value of £40,000. During the same year it was estimated that there were in H. 212,905 horses (upwards of 4000 stallions), 863,362 horned cattle, 2,156,920 sheep (of which 244,000 were merinos), 572,866 swine, and 158,203 goats. In East Friesland large flocks of geese are reared, the flesh of which is salted and exported; while large quantities of butter and cheese are annually exported from the same localities.

The rivers and lakes of H. yield an abundance of fish, and there are upwards of 2500 well stocked fishponds in the kingdom. Salmon is obtained in large quantities in the Weser. The herring-fishery is principally carried on from Emden, whence it is prosecuted with considerable enterprise, the boats going not unfrequently as far as the coasts of Scotland. The forests on the Harz Mountains and their offshoots yield large quantities of wood, chiefly pine and oak, while the valleys grow tobacco and some good fruits. The mineral resources of H. are rich and varied, including iron, copper, silver, lead, sulphur, zinc, coal, cobalt, vitriol, alum, arsenic, lime, gypsum, marble, pipe-clay, kaolin, freestone, slate for tiles, salt obtained from 18 works, &c. In 1875 the annual production of some of the chief minerals was estimated as follows: iron, 2,682,120 cnt. (1 centner = 110 lbs.); lead, 169,000 cnt.; salt, 1,092,000 cnt.; coal, 2,500,000 cnt. About one-third of the iron and one-fourth of the salt are obtained from the mines of the state, and it is estimated that 85,000 persons are employed in the different mining operations of Hanover.

Commerce, &c.—The trade, which has undergone some augmentation since H. joined the German Zollverein (q. v.) in 1854, is still very unimportant and undeveloped, notwithstanding the numerous favorable conditions presented by the navigable rivers of the Hanoverian States, their good ports, well-kept high-roads, and extended railways. Besides mining, agriculture, and the rearing of cattle and other animals, the chief branches of industry are sugar-refineries, and the manufacture of tobacco, paper, hemp, thread and linen, leather, bricks, pipes, &c.

The exports consist mainly of mineral products, coarse linens and canvas, honey and wax, feathers, wood, wool, horses, cattle, wheat and rye, butter, hops, rape and and linseed, oil-cakes, hams, and sausages. The imports comprise English manufactured goods, colonial products, wine and spirits, and silk. Emden is the principal trading port, but the chief sea-trade of the country is effected through Hamburg and Bremen, while H. has an extensive commission and transit business with Leipsic and Frankfurt-on-the-Maine. Besides, Emden, Pappenberg, Harburg, Lehe, and Leer, are rising into some note as trading ports. H. has good high-roads, and its postal system is well organised. The length of its post and high-roads is estimated at upwards of 3800 miles, and that of the lines of railway in operation (in the year 1875) at six hundred and sixty miles. The telegraph lines are about seven hundred miles in extent.

Revenue.—The revenue amounted, according to the budget for 1861—1862, to 19,598,322 thalers (the thaler = 2*s.* 10½*d.*), while the expenditure for the same year was 19,763,941 thalers. The national debt had risen, in 1861, to 46,344,886 thalers, including a debt for railways of 30,628,075 thalers.

Army.—The army numbered nearly 27,000 men. The service was for a period of seven years, the last year's service, however, being limited to the reserved corps. The principal fortresses are those of Stade, Harburg, and Fort-William, in the harbor of Bremen. H. furnished 15,280 men to the German Confederation, and had four votes in the Plenum, or Full Council of the diet.

Religion, Education, &c.—The population of H., in 1871, was 1,964,527. Of these there were—Protestants, 1,713,711; Roman Catholics, 238,809; different Christian sects, 8284; Jews, 12,799. Religious matters are under the direction of Lutheran (Evangelical) and Reformed consistories at Hanover, Stade, Otterndorf, Aurich, Hadeln; the see of Osnabrück, which is held alternately by a Roman Catholic and a secular Protestant bishop; and the Roman Catholic see of Hildesheim.—H., like other countries of Northern Germany, is amply provided with educational institu-

Digitized by Google

tions. It has one university at Göttingen, 17 high and 13 lower gymnasia, 5 normal and 21 polytechnic schools, a military academy at Hanover, a "Foundation Padæogogium" at Hefeld, schools of surgery and midwifery, of which that at Celle is the most esteemed, schools for the blind, deaf and dumb, and about 3600 free parish schools, which are in most cases dependent upon the local church party, whether Protestant or Catholic. There are also several good mining and forest schools in different parts of the kingdom.

The poor are provided for partly by voluntary subscription and partly by the proceeds of their own labor in the poor-houses erected for the reception of persons in want. There are partially self-supporting reformatories at Emden and Celle, while Hanover, Hameln, Göttingen, Lüneburg, Emden, and Hildesheim have all their separate houses of detention and poor-houses.

Law.—The administration of the law was presided over by a special ministry. Criminal cases have, since 1848, been tried before sworn juries.

Constitution, Government.—H. was a sovereign kingdom from 1814 to 1866. The monarchy was hereditary in the male line, and the administration was conducted by a responsible ministry with two representative chambers, whose concurrence was essential to the exercise of certain prerogatives of the crown. The upper of the two chambers consisted of the princes of the blood-royal; several mediatised princes, and other members of the higher nobility; four members nominated by the king; and fifty other members. Half the number of the elected representatives retired every third year. The lower chamber consisted of 2 of the members of the ministry nominated by the king, 2 deputies appointed by the chamber itself, 38 representatives of towns and boroughs, and 44 members for the country districts. There were, moreover, 7 provincial assemblies, whose concurrence and assent were necessary for the promulgation of laws and the levying of taxes within their several districts.

The highest department of the government was the Council of State. The cabinet which, after 1848, was composed of responsible members, comprised seven ministers, each of whom presided over a special department of the administration. The chambers were summoned every two years, but the diet or landtag was septennial. The monetary system, and the weights and measures of H., were the same as those adopted by the German Zollverein (q. v.).

People.—The Hanoverians are a mixed race: those inhabiting the north-eastern and central provinces are mostly Saxons, but those on the coast are of Frisic origin; those on the west of the Ems, Dutch; and those in the southern provinces, Thuringians and Franconians. Platt-Deutsch, or Low German, is commonly spoken in all the rural districts excepting those bordering upon the Netherlands, in which Dutch is the ordinary form of speech; while High German, as in every other part of Germany, is the language of the educated and higher classes.

History.—The country at present included in the kingdom of H. was occupied in remote ages by Saxon tribes, which after a long-continued struggle under their leader Witikind, submitted to the dominion of Charlemagne, and embraced Christianity. H. continued to form part of the Frankish empire until the time of the Emperor Ludvig the German, when Ludolf of Meissen incorporated it in the duchy of Saxony. In 951, the Emperor Otho I., who had inherited Saxony from his father, Henry I., the hereditary duke, bestowed it on Hermann Billing, on the extinction of whose family in 1106, it passed to Lothaire of Supplinburg. By the marriage of Lothaire with Richenza of Nordheim, new territories were added to the duchy, which passed to the family of the Guelphs through their descendant Gertrude, who married Henry the Proud of Bavaria. Henry the Lion, the son of the latter, did much to advance the civilisation and commerce of his subjects by conferring rights and privileges upon various towns which had advocated his cause; but when he fell under the ban of the empire, a period of anarchy and confusion succeeded, which at first threatened the ruin of the country. When Henry lost the duchy of Saxony, he retained his hereditary lands of Brunswick and Lüneburg through the special favor of the emperor.

The Reformation early found adherents among the burgher and rural populations of H.; but as the new doctrines were strongly opposed by many of the chief magistrates and the majority of the nobles, their formal introduction was made the subject of violent altercations between the opposite parties, until the conversion of

Digitized by Google

Ernest I. of Lüneburg in 1583 gave support and stability to the cause of Protestantism.

The line of Brunswick-Lüneburg began with William the younger, who in the partition which he and his elder brother Henry (the founder of the reigning Brunswick house) made of the dominions of their father, Ernest I., obtained in 1569 the duchies of Lüneburg and Celle (Zell). William died in 1592, leaving seven sons, who, with a view of avoiding the further dismembering of their patrimony, agreed that the eldest should succeed, but that one only of their number should marry. The lot of marriage fell upon the sixth brother, George, who died in 1641, in the reign of his fourth brother, Duke Frederick, the last survivor of the family. On the death of Frederick in 1648, Christian Lewis, the eldest son of Duke George, succeeded his uncle, and in accordance with a family compact, took, as his portion of the inheritance, Lüneburg, Grubenhagen, Diepholz, and Hoya, with Celle for his residence; while his next brother, George William, obtained Kalenberg and Göttingen, with Hanover for his residence, and thus gave origin to the lines of Celle and Hanover, which were again merged in one after the death of Duke George William, third son of Duke George, who, dying without male heirs, was succeeded by his kinsman and son-in-law, the elector, George Lewis of Hanover, who ascended the throne of England as George I. (q. v.) on the death of Queen Anne in 1714, as the nearest Protestant heir of the deceased sovereign, being son of the electress, Sophia, daughter of Elizabeth, queen of Bohemia, and granddaughter of James I. of England. Duke George William of Celle deserves notice for his warlike and active administration, and for the part which he took in all the momentous affairs of his age: thus he sent auxiliaries to Venice, to aid the republic against the Turks; co-operated with the Duke of Brunswick to reduce his insurgent capital; entered into an alliance with the emperor against France and Sweden; sent an army into Hungary to resist the Turks: and in 1688, he lent troops and money to William of Orange against James II. of England.

With George Lewis, king of England, and the second elector of H. or Brunswick-Luneburg, a brighter epoch opened to the Hanoverians, who on his accession to the throne of England, were relieved from the burden of maintaining the court and local household, while the revenues of the crown were thenceforth appropriated solely to the general purposes of the state. Bremen and Werden were obtained in this reign by purchase from Denmark. George II., who succeeded in 1727, shewed the same care as his father to spare the revenues of H. at the expense of those of England. In his character of elector he participated in the Austrian War of Succession, 1740—1748, but in the Seven Years' War, when H. suffered materially from the incursions of the French, he sided with Prussia. This king founded the university of Göttingen in 1745. The first thirty years of the reign of George III. (q. v.), who succeeded on the death of his grandfather in 1760, contributed largely towards the prosperity of H., which, like the other states of Northern Germany, profited by the increased English and American trade, for which the Hanoverian ports and rivers formed the regular channels of communication with the rest of Germany. In 1793 Hanoverian troops took part in the wars against the French republic, but the expenses of their maintenance were defrayed by England; and it was not till 1801, when Prussia, refusing to acknowledge the neutrality of H., threw troops into electorate, that H. suffered from the anomalous position in which its relations to England placed it in regard to the other states of Germany. The Prussian troops evacuated H. at the close of the same year, in accordance with the treaty concluded into between France and England; but the claims and counter-claims which arose from this occupation gave rise to protracted discussions, which were not finally settled till 1830, when it was stipulated by treaty that H. was to pay to Prussia an indemnity of 375,000 thalers. In 1803, when war was renewed between England and France, Napoleon threw an army, under the command of Mortier, into H. the result of this measure was to compel the Hanoverian government to enter into a convention with the French general, by which it bound itself to abstain from serving against France during the pending war; to give up fortresses, arms, horses to the enemy; to subsidise French troops; and to participate unconditionally in the general costs of the war. A large number of the army, however, contrived to evade signing these articles of surrender, went over to England, and the men were incorporated into the German legion, which did good service both

the Peninsular war and in the Belgian campaign of 1815, which terminated in the battle of Waterloo. In 1806, Napoleon, after having ceded H. to Prussia, and again withdrawn it, appropriated a portion of the electorate to complete the newly-formed kingdom of Westphalia, which in 1810 received the whole of the Hanoverian territory. Finally, H. was united with France, and the north-west portion divided into the departments of Bouches de l'Elbe, Bouches du Weser, and Leine, while the south-east portions formed the Westphalian departments of Atter and Harz. After the expulsion of the French, H. was elevated to the rank of a kingdom in 1814. In the same year, the Prince Regent of England convoked the Hanoverian states to deliberate upon the best manner of consolidating the various independent governments of the different provinces into one systematic whole. In 1816, the Duke of Cambridge, the brother of the Prince Regent, was appointed governor-general of H.; and in 1819 a new constitution was granted, in accordance with which the provincial states were retained and enlarged, and two representative chambers associated with them. Very little was done in the time of George IV. towards the amelioration of the administration, and the general disaffection and distrust had risen to the highest pitch when William IV. ascended the throne. The influence of the French revolution of July (1830) extended to H., and in 1831, disturbances broke out at Osterode and Göttingen. These were speedily put down, but as the national discontent did not abate, the prime minister, Count Munster, who had long been obnoxious to the mass of the people, was dismissed, and the Duke of Cambridge, who had hitherto acted as governor-general, invested with the title of viceroy, and intrusted with very extensive powers. The duke recommended gradual reforms, but as the popular feeling was decidedly in favor of a thoroughly remodelled constitution, the states were again convoked; and finally, in 1833, a draft of the proposed constitution, which had been prepared by a commission appointed by the ministry and the states, was laid before William IV., and after it had been considerably modified in England, it received his signature, September 26, 1833, without having been again submitted to the assembly of the states. The death of William IV. in 1837, placed H. under the rule of the next male heir, Ernest August, Duke of Cumberland. One of the first measures of the new king was to abrogate the constitution of 1833, to which he had from the time of its adoption refused to give his assent, and to restore that of 1819.

When the government demanded the oath of allegiance from all persons holding office under the state, seven of the Göttingen professors—viz., Dahlman, Gervinus, J. Grimm, F. Grimm, Ewald, Albrecht, and W. Weber—refused to take the required oath, in consequence of which all were deprived, without any preliminary investigation, of their chairs, and the three first-named banished from the country.

From this period till 1848, when the success of the French revolution compelled the German rulers to adopt a more liberal policy towards their subjects, the king showed himself resolutely averse to sanction reform. Liberal measures, however, were at length introduced, and the new constitution of 1848 was more liberal than that of 1833. The king, moreover, organised some useful reforms in the internal administration, and effected great improvements in several of the towns.

The chambers of H. showed great zeal in the reorganization of Germany, and King Ernest entered into a triple alliance with Prussia and Saxony, to promote the unity of the German nation. Unlike many of his German contemporaries, King Ernest kept the promises which he had made to his people during the revolutionary crisis of 1848—1849; and although the nobility made the most pressing appeals to him for the recovery of their ancient privileges, and the overthrow of the constitution, he refused to withdraw his pledge that the country should be governed in accordance with constitutional principles; and such confidence was placed in his word that, notwithstanding his avowed opinions, his death, in 1851, was regarded as a serious blow to the cause of reform, for his son and successor, George V., was known to hold very extreme views in regard to the kingly power and the claims of the aristocracy. The early measures of the new king were not calculated to allay the fears entertained of his policy; but the decisive declaration of the assembly of the states that they were desirous of seeing the reforms completed which had been begun by the late king, and their vote of want of confidence in the new cabinet, prevented any marked retrogressive movement on the part of the ministry, and in 1854 H. joined the Zollverein. In 1855, the constitution underwent various modifications in ac-

Digitized by Google

cordance with the demands of the federal diet, by which it was made to approximate more closely to that of 1840. Although the changes were unpopular, they met with no energetic opposition. After the war of 1866, H. became a province of Prussia. See GERMANY.

HAN'OVER (Ger. *Hanno'ver*), formerly capital of the kingdom, now chief town of the province of Hanover, is situated on a plain lying on both banks of the Leine —which is crossed by ten bridges, and is navigable hence to the ocean—about 100 miles n.n.w. of Hamburg. It consists of the old town, and the suburbs Glocksee and Linden, and with these inclusive, it had, in 1871, a population of 104,248. The older parts of the city are mean and unattractive, but since 1837, when by the accession of Ernest-Augustus, Duke of Cumberland, to the throne, it became the residence of the sovereign. H. has undergone very extensive alterations and improvements. In the Waterloo Platz, with its column surmounted by a figure of Victory, are the fine new barracks and arsenal. Besides these, the most interesting buildings are the stately town-hall in the market-place, founded in 1439, with an adjacent public library of 40,000 volumes; the royal library, with its 150,000 volumes and 9000 MSS., its incunabula, archives, and valuable state papers; the theatre, one of the largest in Germany; the king's palace; the museum, with good natural-history collections; a gallery of pictures, &c.; and the royal state palace, built on the site of a monastery of Minorites in 1682, which deserves notice for the magnificence of its internal decorations, and for the number and value of the objects of ancient and modern art which it contains; its fine gallery of paintaings; its chapel, in which are preserved numerous relics and antiques, many of which were brought from Palestine by Henry the Lion in 1172; and an altar-piece by L. Cranach. Among the charitable institutions of H. are the orphan asylum, school for the blind, infirmaries, hospitals, and poor-houses, the latter of which are principally supported by private subscription. H. is well provided with educational institutions, the most noteworthy of which are the Georgianum, a collegiate school for the sons of noblemen; a lyceum, and a gymnasium. The city has also polytechnic, normal, and medical schools, and 25 free public schools. H. was the first place in Germany that was lighted with gas (in 1826). The discovery of a rich bed of asphalt in the neighborhood of the town has been the means of giving the streets better side-pavements than most other German towns possess, while the recent improvements that have been effected in the old system of sewers, which dates from the 16th c., render the drainage particularly good. H. has gained pleasant walks and pleasure-grounds by the levelling and planting of the ramparts, while in the immediate vicinity of the town lie the royal palaces of Herrenhausen and Montbrilliant, whose beautiful grounds and gardens are freely opened to the public.

Since H. became a centre of the North German railway system, its manufactures have greatly increased in importance. Amongst the foremost are the manufactures of cotton, wax-cloth, machinery, locomotives; also gold, silver, and bronze wares, chemicals, leather, and tobacco. The trade of the place has also rapidly developed of late years.

See Leutsch, "Ein Blick auf die Geschichte H." (1827); Kobbe, "Abriss einer Geschichte d. Königreichs H." (1823); Bülow, "Beiträge zur Gesch. d. braunschw-lüneb. landes" (1829); Stieler's "Atlas" (1861); Thies, "Hannover und Umgegend" (1874).

HANSARD, a well-known name in connection with the printing of the British parliamentary records. The first of the family was Luke H., who was born in 1752 at Norwich, and coming to London, worked for some years as compositor in the office of Hughes, the printer to the House of Commons; and in 1800 succeeded Hughes as sole proprietor of the business, which is still carried on by his family. Competition and other causes have led to a division of the parliamentary printing, but the Messrs. H. still print the bills before parliament, the reports of committees, and some of the accounts.

The name of H. is connected with an important question of parliamentary privilege. The case was briefly as follows: A bookseller, named Stockdale, brought an action for libel against the Messrs. H., the libel consisting of statements in the parliamentary reports which the latter had printed, and Lord Chief-Justice Denman decided in favor of Stockdale. The House of Commons complained of a breach of

Digitized by Google

privilege, and another action was raised in the Court of Queen's Bench, but, as before, the plea of *the orders and privileges of the House* was overruled. After a third action had been brought, with a similar result, an act of parliament was passed, directing that any proceedings against persons for publication of papers printed by order of either House of Parliament are to be stayed by the courts of law, upon delivery of a certificate or affidavit that such publication is by the order of either House.

The Hansards are, however, most widely known by the reports of the debates in Parliament, which are published by them and bear their name. When charges of inconsistency are made in Parliament, they are usually verified by a quotation from "Hansard," the accuracy of which is seldom or never disputed. An opinion, in consequence, widely prevails that the Messrs. H. retain a corps of parliamentary short-hand writers in their service, from whose reports the debates printed in their work are prepared. This popular impression is entirely erroneous. The speeches printed in "Hansard" are taken in the gross from the London morning newspapers. They are usually sent to the peers or members by whom they are spoken for revision and correction, and many important alterations, expurgations, and additions are made in the speeches thus revised, when a speaker has been led away by the heat of debate, or has, on the other hand, failed to say all that was in his mind when he rose. The convenience, however, of possessing some record more or less authentic of parliamentary proceedings, has led the executive government to take a certain number of copies of "Hansard" for distribution among the public offices and departments. Many peers and members of parliament, foreign governments, and public libraries, also subscribe to this work, which is issued at a certain fixed price, which the Messrs. H. guarantee, at the commencement of each session, shall not be exceeded.

HANSEA'TIC LEAGUE, The, or the Hansa, was a trade-union established in the 13th c., by certain cities of Northern Germany, for their mutual safety, and for the protection of their trade, which at that period was exposed to the rapacity of rulers, and the lawless attacks of marauders on land, and pirates at sea; yet, notwithstanding obstacles such as these, and the heavy imposts levied on the German traders by their princes, several towns of Northern Germany, as, for instance, Hamburg, Lübeck, and Bremen, had acquired some commercial importance as early as the 11th century. The fame of the rich cargoes that found their way into their factories had given rise to swarms of pirates, who infested the mouths of the Elbe, and the outlets to the Baltic; and the necessity which the neighboring ports felt of protecting themselves effectually from such troublesome enemies, led, in 1219, to the settlement of a compact between Hamburg, Ditmarsh, and Hadeln, to protect the course of the river and the adjacent sea. This agreement was followed two years later by a treaty of mutual aid and defence between Hamburg and Lubeck, which was joined in 1247, by the town of Brunswick; and thus was formed the German League, or Hansa, the name of which indicated in the Plattdeutsch of the traders, a bond or compact for mutual aid. The progress of the League was so rapid, that, before the year 1260, when the first diet met at Lubeck, which was the central point of the whole association, it had its regularly organised government, with a fixed system of finance and administration.

The entire League, which at one period numbered 85 towns, and included every city of importance between Holland and Livonia, was divided into four classes or circles: 1. The Vandal or Wendic cities of the Baltic; 2. The towns of Westphalia, the Rhineland, and the Netherlands; 3. Those of Saxony and Brandenburg; 4. Those of Prussia and Livonia. The capitals of the respective circles were Lubeck, Cologne, Brunswick, and Danzig.

The cities composing the League were represented by deputies at the general diet, which met every three years, generally at Lubeck, which was considered as the capital of the League, to discuss and settle the current business of the League, and held an extraordinary meeting every ten years, to renew the various unions which constituted the great Hansa. The edicts of the diet were communicated to the masters of the great Circles, who remitted them to the several guilds within their respective jurisdictions.

Four large foreign factories were established at London (1250), Bruges (1252), Novogorod (1272), and Bergen (1278); and besides these and the ordinary members, various cities were connected by treaties of limited alliance with the League; as,

Digitized by Google

for instance, Amsterdam, Antwerp, Bordeaux, Barcelona, Cadiz, Dordrecht, Leghorn, Lisbon, Marseille, Messina, Naples, Ostend, Rotterdam, Rouen, Seville, St Malo.

The Hanseatic League was the first systematic trade-union known in the history of European nations, and the high political influence which it rapidly attained was due to its development of sounder principles of trade than any that had hitherto been put into practice; while in the earlier periods of its existence, it exerted a beneficial action on the advance of civilisation, which can scarcely be overrated. Its professed object was to protect the commerce of its members by land and by sea, to defend and extend its commercial relations with and among foreigners, and as far as possible to exclude all other competitors in trade, and firmly to maintain, and, if possible, extend, all the rights and immunities that had been granted by various rulers to the corporation. For the promotion of these ends, the League kept ships and armed men in its pay, the charge of whose maintenance was defrayed by a regular system of taxation, and by the funds obtained by the money-fines which the diet levied for infringements of its laws. In its factories, only unmarried clerks and serving-men were employed, and an almost monastic discipline was enforced; but the by-laws of the League prescribed a system of daily sports and light occupations for the recreation of the men, while sensible regulations for their comfort and cleanliness, and for the celebration of festivals at certain fixed times of the year, bear evidence of the sound sense that influenced the mode of government of the Hansa, and which was further shewn by the injunction to the masters of factories to avoid everything that could hurt the prejudices of the foreigners among whom they were placed, and to conform in all things lawful to the habits of the country.

For many years the Hanseatic League was the undisputed mistress of the Baltic and German Ocean. It created new centres of trade and civilisation in numerous parts of Northern Europe, and contributed to the expansion of agriculture and other industrial arts, by opening new channels of communication by means of the canals and roads with which it connected together the members of its association. The greatest powers dreaded its hostility and sought its alliance, and many of the powerful sovereigns of the middle ages were indebted to it for the most substantial benefits.

In England, since the time of King Ethelred, German traders had enjoyed the same privileges as native-born Englishmen. Henry II. took the Cologne merchants, together with the house which they occupied on the Thames, specially under his protection, allowing to them and their successors the privilege of exporting goods free of duty, and selling their Rhenish wines for the same price at which French wines were then sold in London; and in 1261 these privileges were extended by Henry III. to all the Germans in London who had a share in the Hanseatic Factory, or *Aula Teutonicorum*, which was long known to Londoners as the "Steel-yard." In 1388, the Hansards gained the good-will of Edward III. by supplying him with the money necessary to redeem the regalia and coronation jewels of his queen, which he had pledged to Cologne money-lenders, and by allowing him to draw upon their houses for large sums with which to defray the cost of his French wars. Their relations to other sovereigns at that period were equally significant of their power, for they defeated Kings Eric and Hakon of Norway, and King Waldemar III. of Denmark, in 1348, deposed Magnus of Sweden, and bestowed his crown upon Duke Albert of Mecklenburg; and in 1428 equipped a fleet of 248 ships, carrying 12,000 soldiers, against Eric of Denmark.

With the fifteenth century, the League reached at once its culminating point and its decline, for in proportion as the seas and roads were better protected by the states to which they belonged, and rulers learned to comprehend the commercial advantages of their dominions, its supremacy declined; while the discovery of America, and of a new sea-route to India, gave an entirely different direction to the trade of Europe. The Hansa had, moreover, arrogated to itself, in the course of time, presumed rights of imposing the greater and lesser ban, and exercising acts of sovereignty and judicial power, which were incompatible with the supremacy of the rulers in whose states they were enforced, and hence the League was necessarily brought into frequent hostile collision with the local authorities. Thus, in accordance with their system of exclusive policy, the Hansards refused to grant to merchants trading in

Digitized by Google

foreign parts the same privileges in the Hanseatic cities which they themselves had enjoyed for centuries in England, Russia, and Scandinavia, and hence arose dissensions, which not unfrequently ended in a fierce maritime warfare. By way of retaliation for the pertinacity with which the League refused to grant to the English the same immunities which had been accorded to traders of other nations, parliament required that Germans should pay the tax on wool and wine, which was exacted from all other foreigners in the English markets; and although the Hansards strongly resisted, they were at length condemned by the courts, in 1469, to pay a fine of £13,500; and they would probably have lost all they possessed in England, if their cause had not been advocated by Edward IV., who had more than once been indebted to them for money and aid, and who in 1474 secured for them, by a clause in the treaty of Utrecht, a restitution of nearly all their former rights in England. In 1598, their obstinate pertinacity in insisting upon the maintenance of their old prerogatives, notwithstanding the altered condition of the times, drew upon them the anger of Queen Elizabeth, who dispatched a fleet under Drake and Norris to seize upon the ships of the Hansa, of which 61 were captured, while she banished the Hansards from their factory in London. These measures had the desired effect of compelling the League to receive English traders on equal conditions, and thenceforward the Hansards were permitted to occupy the Steelyard, as in olden times. The Hansa had, however, outlived its date, and at the diet held at Lübeck in 1630, the majority of the cities formally renounced their alliance. Hamburg, Lubeck, Bremen, and, for a short time, Danzig, remained faithful to their ancient compact, and continued to form an association of free republics, that existed unchanged till 1810, when the first three were incorporated by Napoleon in the French empire. These, in 1813, combined with Frankfurt-on-the-Maine to form a union of the "Free Hanseatic Cities." At a convention in July 1870, the powers and privileges of the three free towns were re-established and re-organised, and under the empire they still retain their local self-government. See Sartorius, "Gesch. des hanseatischen Bundes," (1802—8); Barthold, "Gesch. der deutschen Hansa" (1854); "Hansische Geschichtsblätter" (1871-7).

HA'NSI, a town of the district of Hissar, in the province of the Punjab, lies 89 miles to the north-west of Delhi, in lat. 29° 6′ n., and long. 76° 3′ e. It is watered by a branch of the Delhi Canal, made in 1356 by Feroz Toghluk, and cleared in 1825 by the British government. This work, besides its domestic and agricultural uses, is available for navigation. The population of the town, according to the latest census (1868) was 13,568.

HANSTEEN, Christoph, a Norwegian astronomer, was born at Christiania, 26th September 1784. At first intended for the legal profession, he subsequently devoted himself entirely to the study of mathematical science. In 1814, he was appointed to the chair of mathematics in the university of Christiania, and there, in 1819, published his celebrated work on Magnetism, which was afterwards translated into German under the title of "Untersuchungen ber den Magnetismus der Erde," and produced a great sensation, especially in England, so much so, that in almost all the voyages of discovery since undertaken, magnetic observations have been made in conformity to his directions. In 1821, he discovered the "law of magnetic force." See MAGNETISM. After having visited London, Paris, Hamburg, Berlin, and different parts of his native country, he resolved to undertake a journey to Siberia, for the purpose of continuing his magnetic observations, which he accomplished from 1828 to 1830, and returned to Europe with a large collection of facts, which were of much service in aiding to dispel the obscurity which enveloped and still partly envelops this subject. On his return to Christiania, he prevailed upon the government to erect an observatory, fitted also for magnetic observations. Besides occupying his chair in the university, H. was professor of mathematics in the School of Artillery, superintended the triangulation of Norway, and helped in the reorganisation of the national system of weights and measures. He died 15th April 1873. He published lectures on astronomy, a work on mechanics, another on geometry, and several memoirs, of which the greater part are inserted in the "Magazin for Naturvidenskaberne."

HANUMÂN, or Hanûmân (the nominative of the Sanskrit base *Hanumat* or

Digitized by Google

Hanûmat, literally meaning, "having a jaw," but understood to imply "having a broken jaw"), is the name of a fabulous monkey, who plays a great rôle in the legendary history of the second or classical period of Hindu mythology. He is represented there as the strenuous friend and ally of Vishnu, when the latter, in his incarnation as Râma, made his expedition to Ceylon, in order to recover his wife Sîtâ, carried off by the giant Râvana. See VISHNU. In the war between Râma and Râvana, Hanumân, on one occasion, is related to have bridged over the ocean between the continent of India and Ceylon with rocks of a prodigious size, which he and his friends threw into the sea; on another, to have set Lankâ on fire by means of igniting his tail, previously dipped into combustible matter; and when, to restore to life his friends slain in battle by the armies of Râvana, he flew to the Himalaya, where he intended to gather the magical herbs required for his purpose; he grew impatient at not finding them quickly, and tore off the whole peak of the mountain, which he then carried to Lankâ, the capital of Ceylon. Such and many other extraordinary feats are related of this "chieftain of the monkey tribe," especially in the great poem "Râmâyana," which is devoted to the history of Vishnu in his descent on earth as Râma, and in many of its chapters dwells with particular predilection on Hanumat the monkey. Of his origin and his first darings, the older version of this epos gives us the following account; his mother was an Apsaras or nymph *Punjikasthalâ*, who, through some curse, however, was born as the daughter of a monkey, and under the name of *Anjanâ*, became the wife of the monkey *Kesarin*. Possessing the power of assuming whatever shape she pleased, she once transformed herself into a human being, and walked in splendid attire on the top of a mountain. There *Vâyu*, the god of wind, caught sight of her, and became bewildered with love. The result of his stormy courtship, though purely ideal, as he at least explained it to her, was the child Hanumat. The later version of the "Râmâyana" adds to this story a prefatory incident to justify, as it were, the liberty which the god took with the wife of Kesarin, by making him act under the promise of a Rishi or saint. When a child, Hanumân, while once lying on the lap of his mother, saw the sun rise, and thinking it was a fruit, conceived the desire of taking it. Up he started, therefore, into the air; but Indra, angry at his presumption, hurled him down with his fiery thunderbolt to the top of the mountain, where in his fall he broke his left jaw.

The numerous pictures and sculptures by which this singular Hindu deity is represented, refer to these and similar episodes of his history. He appears either in a fighting posture, armed with disk, sword, or trident, and trampling on some vanquished foe; or he is carrying the rocks with which he bridged over the sea; or he is in the attitude of a worshipper—which means of Vishnu. Frequently his figure is single; sometimes it is connected with that of Garuda, the sacred bird-vehicle of Vishnu; and it is never missing in those groups which emblematically represent the principal facts of Râma's life. Those not very familiar with the meaning of Hindu idols, will never fail to recognise him by his prodigious tail.

That Hanumân is the type of the monkeys worshipped by a certain class of Hindus, requires no further remark, nor will it be necessary to say that this monkey-worship, to which so early a writer as Megasthenes bears testimony when he speaks of the numerous monkeys coming to the town Latage—probably in the north of India—and being fed there daily, has its origin in the devotion to the memory of Hanumân, that great friend of Vishnu. The foundation of the myth is probably an historical one. There is no reason to doubt tradition when it tells us that a hero—it calls him Râma—carried Brahmanic institutions from the north of India to Ceylon, and we may believe it also when it couples with this event a cause which transformed this expedition into a war between the Brahmanic population of India and that of Ceylon. Nor is it improbable that Râma, on his march to the south, formed alliances, and that his allies, on account of their barbarous condition, were compared by his followers to monkeys. There, however, all that may be real in the myth of Hanumân seems to end, for its other ingredients are either purely legendary, or represent phenomena of a physical kind. When Râma ceased to be the human hero and became an incarnation of Vishnu, it followed, as a necessary consequence, that the history of all the circumstances connected with this change also became in part imaginary, and in part influenced by the character which belonged to the god. It is

Digitized by Google

the latter influence which is especially perceivable in the origin ascribed to Hanumân. Vishnu is in the Vedas a deity representing attributes of the sun, and the legends of the birth of his ally are such as would originate in phenomena connected with sunrise. To this the names ascribed to his mother seem to point; for the Apsarasas "were originally personifications of the vapors which are attracted by the sun, and form into mists or clouds" (see Goldstucker's Sanscrit Dictionary under the word "Apsaras"); and *Anjanâ*, among other meanings, signifies night.

HA'PSBURG, or HABSBURG, House of, of which the imperial family of Austria are the representatives, derived its name from the castle of Habsburg, or Habichtsburg (Hawk's Castle), on the right bank of the Aar, in the Swiss canton of Aargau. The castle was built in the 11th c. by Werner, Bishop of Strasburg, grandson of Gunthrun the Rich, Count of Alsace and Breisgau, who, according to the Austrian chroniclers, was descended from Ethico I., Duke of Alemannia and Alsace in the 7th century. Werner delivered the castle to his brother Kanzeline, whose nephew, Werner II., was the first who assumed the title of Count of Hapsburg. Albrecht or Albert III., the great-grandson of Werner II., assumed the title of Landgraf of Upper Alsace, or Sundgau. This prince possessed a great part of Swabia, Alsace, and the Aargau, to which his son, Rudolf I., added Lauffenburg. On his death in 1232, his sons, Albert IV. and Rudolf II., divided their father's possessions—Rudolf becoming the founder of the Hapsburg-Lauffenburg line. This branch became extinct in 1408 in Germany, but is still represented in England by the Fielding family. The whole possessions of Rudolf's lineage reverted to the Austrian line in 1415. Albert IV. laid the foundation of the future greatness of the House of Hapsburg. He left three sons, the eldest of whom, Rudolf III. (Rudolf I. of Austria), succeeded him, and by appropriating the provinces which, as emperor, he had wrested from Ottocar of Bohemia—viz., Upper and Lower Austria, Styria, Carinthia, and Carniola—greatly increased the power of his family. His son, Albrecht or Albert I. (q. v.), succeeded in 1291 to the family possessions. The further history of the House of H. may be traced in that of Austria (q. v.). It may be noted here that Ernest, surnamed the Iron, one of the sons of Leopold II., and founder of the Styrian line, married Cymburga, daughter of Ziemovitz, Duke of Masovia (now province of Warsaw), and niece of Uladislas Jagellon, king of Poland, celebrated in Austrian history not only for her beauty and accomplishments, but also for her great strength of body, of which latter quality some historians give remarkable instances. From her are said to be derived the thick lips which are a characteristic feature of the Austrian family.

Compare Prince Lieknowski, "Geschichte des Hauses Habsburg" (3 vols. Wien, 1835—1837), also Coxe's "House of Austria."

HARALD I. (surnamed Haarfager, or beautiful-haired), king of Norway (863—930), was a descendant of the ancient race of the Ynglings in Sweden, and the son of Halfdan Svarte, a powerful jarl in Norway, who is noted as the earliest lawgiver of his country. According to the popular saga, H. was induced to attempt the subjugation of the whole of Norway, through his love to a high-born maiden, named Gyda, who declared that she would not be his wife until he was sole king of Norway; and he swore that he would neither cut nor comb his hair till he had subdued all the land to his sway—an oath which he kept. After many years' contest with his brother jarls, he finally reduced the whole of the country from Finmarken to the Naze of Norway; and after defeating the last general confederacy of the independent Norwegian chieftains in a naval battle at Hafursfjord, the present Stavengerfjord, he remained sole ruler of the land (872). Previously to his reign, Norway, like the other Scandinavian countries, had been divided into numerous independent districts or tribes, governed by their several kings. H., however, replaced all these rulers by jarls of his own, under whom were placed Herser or bailiffs, to whom was committed the charge of seeing that the tax which was imposed over all the land was faithfully paid. H.'s severity compelled the deposed rulers to seek other homes; and his reign is memorable for the many new settlements which were made by these exiles. Thus, the Orkneys were settled by the fugitive Ejnar, the son of the king's friend, Rognvald, jarl of More; while another son, Ganger Rolf, who had incurred H.'s anger by repeated acts of piracy, sailed with his followers in 876 to France, where he founded the Norman power. Other

Digitized by Google

exiled Norwegian jarls or kings colonised the Hebrides, Shetland and Farõe Islands, and Iceland, whence they continued their customary sea-roving and plunders until these islands, with the exception of Iceland, were subdued by Harald. Although a barbarian, he ruled with a sound policy in advance of his age, and by his firmness succeeded in suppressing for the time the private warfare and sea-piracy which had prevailed in Norway before his reign; but the dissensions of his numerous sons checked all the good that might have resulted from his measures. To restore concord in his family, he divided his dominions among his children, reserving only the supreme power to himself. He died in 933 at Troudhiem, which he had made his capital, and was succeeded by his son, Eric Blodoxa, or the Bloodaxe, to whom he had three years before resigned the government.

HARALD III. (surnamed HAARDRAADE, or Double Beard), king of Norway (1047—1067), was the son of Sigurd, chief of Stingarige, and a descendant of Harald I. In his boyhood, he was present at the battle of Sticklestad, in which his brother Olaf, surnamed the Saint, king of Norway, was slain; and he afterwards sought an asylum at the court of his relative, Jaroslav, Duke of Russia, whose daughter he sought in marriage. The rejection of his suit, however, again drove him forth, and he entered upon romantic adventures; and having gone to Constantinople, and become captain of the Vaerlingiar, or Scandinavian body-guard of the Greek emperors, he experienced many marvellous adventures, which have supplied abundant materials for the narratives of the older sagas and modern romances of the north. H. took part in the expedition against the pirates of the Mediterranean; visited Jerusalem, where he fought successfully against the Saracens, whom he also defeated in Sicily and Africa in eighteen pitched battles. On his return to Constantinople, he drew upon himself the vengeance of the Empress Zoe, whose proffered love he had rejected, and with difficulty escaped from the prison into which he had been thrown, on pretence of treason. Having made good his escape, he returned to Russia, married the daughter of Duke Jaroslav, and took her with him to Norway, where his nephew, Magnus (the son of St Olaf), agreed to divide the supreme power with him, in return for a share of his treasures. The death of Magnus in 1047 left him sole king of Norway. His unruly spirit would not, however, suffer him to rest; and in opposition to the pledge he had given his dying nephew, he entered into a war to dethrone the king of Denmark, on whose crown he had no just claim. Although he was successful in battle against the Danes, he gained no real advantages by the contest; and in 1064 he recognised the right of Svend, the nephew of Canute, to the throne of Denmark, and having concluded a peace, occupied himself for a time with the internal affairs of Norway. In 1066 he landed in England, to aid Tostig against his brother Harold, king of England, but was slain in battle; his followers, after having fought with desperation, were obliged to retreat to their ships, in which they sailed for Norway, under the command of Olaf, the son of the slain monarch (25th September 1066).

HA'RAR, a city of East Africa, in the country of the Gallas, the ancient metropolis of the Hadyah Empire, about 219 miles south-west of Berbera, which lies opposite to Aden, at the mouth of the Red Sea; lat. 9° 20', long. 42° 17'. The city, which is about 5500 feet above sea-level, lies upon the slope of a hill from west to east; in the latter direction are plantations of bananas, citrons, limes, the coffee-tree, the khat—a theine plant well known in Arabia—wars or "bastard saffron" (safflower), and sugar-cane; westward are gardens and orchards on a terraced slope; northward is a hill covered with tombs; and to the south, the city falls into a valley or ravine. It is about one mile long by half a mile broad. The streets and alleys are like mountain-roads, strewed with rubbish and with heaps of rocks; and the abodes, built of sandstone and granite, cemented with a reddish clay, present a dingy appearance. H. is surrounded by an irregular wall, pierced with five large gates, and defended by rudely-built oval turrets. The men are very unprepossessing in appearance; but the women are much better looking, and appear to be of a different type. The men are engaged in trade; while the women spin, weave, and cultivate the gardens. Morals are very lax, and the people are much addicted to intoxication with mead and Abyssinian beer. The language of the inhabitants is Arabian, mixed with some apparently indigenous African dialect, and is spoken nowhere else. H. is celebrated for sanctity, erudition, and fanaticism, none but the

Digitized by Google

purely religious sciences being studied. The people are extremely bigoted, and hold all foreigners, but particularly Christians, in hatred and contempt. The city is governed by an emir, whose will is law, who demands the utmost obsequiousness from all under him, but who administers his will with a certain amount of rude but prompt justice. Murderers are given up to the nearest kin, and their throats publicly cut with a butcher's knife. H. is essentially a commercial town. It is the grand dépôt for the coffee, the wars-dye, the cotton, the gums, the tobacco, and the grain of the Galla country, the produce of which is conveyed to Berbera three times a year in immense caravans. The is also an enormous slave-trade carried on, H. being a rendezvous for slave-caravans from all the surrounding countries. The imports are American cottons, shawls, silks, brass, copper, cutlery, dates, rice, sugar, gunpowder, and paper. Provisions are exceedingly cheap, 120 fowls, according to Burton, being purchased for a dollar, and the same sum sufficing to provide a man with bread for a year. The only coin is a bit of brass, coarsely stamped, equal to the 66th part of a dollar; and the emir imprisons all subjects who possess any other money.

H. was founded by Arab invaders, who, in the 7th c., conquered and colonised the tract between the Red Sea and the Abyssinian mountains. Pop. 10,000, inclusive of a considerable number of Gallas and other Bedouins. It was visited in 1855, at great risk, by the fearless and indefatigable Burton (q. v.), to whose interesting account we are indebted for most of our information.—See Burton's "First Footsteps in Eastern Africa" (Longman, 1856).

HARBOR, an inlet of the sea, so protected from the wind and waves, whether by natural conformation of the land, or by artificial means, as to form a secure roadstead for ships. It is with those harbors wholly or in part artificial that this article will deal.

Harbors may be divided into harbors of refuge, and those for commercial purposes. The latter are mostly tidal—i. e., capable of being entered by vessels only at certain states of the tide. The former are roadsteads of good depth, protected by breakwaters, and accessible at all tides, where ships may take refuge during storms. The two kinds are sometimes combined, there being the harbor proper, and a capacious protected roadstead outside of it, as at Cherbourg and elsewhere. See BREAKWATER, CHERBOURG, DOVER, PLYMOUTH, PORTLAND, HOLYHEAD.

With the birth of commerce and naval warfare, in the earliest ages of civilization, arose the necessity for artificial harbors. The Phœnicians, the fathers of navigation, soon set to work to protect their scanty strip of Levantine coast. At Tyre, two harbors were formed, to the north and to the south of the peninsula on which the city was placed. At Sidon, similar but less extensive works long testified to the wealth and engineering genius of the Phœnicians. The breakwaters were principally constructed of loose rubble.

Carthage, in another part of the Mediterranean, also possessed a harbor, though its site is not very satisfactorily determined. It was in two divisions, formed by moles; time, however, has dealt so hardly with it, that few traces remain. Still keeping to the great inland sea, we come to Greece; but here nature had provided so many navigable inlets, that little remained to be done by man. Nevertheless, some minor works were executed at the Piræus and elsewhere, chiefly, of course, for warlike purposes. The Romans, finding ships necessary to the dominion of the world, set about constructing harbors for them, in their usual solid and workmanlike manner. The coasts of Italy still show how well they understood both the principles and the practice of this branch of marine engineering. A distinguishing feature of their harbor-making is the open or arched mole. Built with open arches, resting upon stone piers, it gives full play to the tidal and littoral currents, thus preventing the deposit of sand or mud; but in proportion as this advantage is increased (by increasing the span of the arches), so also is the agitation, and consequent insecurity of the water within.

The decay of commerce and civilisation, consequent upon the fall of the Roman empire, put a stop to harbor-making; nor could any want of the art be felt, until the revival of commerce by the Italian republics of the middle ages. But the rich traffic of Venice and Genoa soon led to the construction of suitable ports at those places; and the moles of the latter city, and the works in the lagunes of Venice, remain to this day. France was next in the field, embanking, protecting, and deepen-

Digitized by Google

ing the mouths of the rivers along her north-western shores, as at Havre, Dieppe, Dunkirk, &c. In 1627, during the siege of Rochelle, Metezeau constructed jetties of loose rubble-stone, to prevent access to the city.

Meanwhile, England, whose ocean-commerce is of comparatively recent date, and whose fisheries even scarcely employed a vessel three hundred years ago, lagged far behind her continental rivals. With few exceptions, her ports were absolutely unprotected, or rather uncreated; and this state of things continued until late in the last century. One of the few exceptions was Hartlepool, where a harbor was formed about 1250; and Arbroath, in 1394. In the 17th c., at Whitby and Scarborough, also in Yorkshire, rough piers were thrown out, protecting the mouth of the port; while at Yarmouth, in Elizabeth's reign, a north jetty and subsequently a south one, were formed. An ancient mole existed at Lyme Regis. But the chief efforts of the early English engineers were directed against the shoals and waves of Dover. When, however, Smeaton rose to vindicate the engineering talent of England, things took a different turn; and now few countries surpass Great Britain in the number of artificially improved commercial harbors, or in the just appreciation of their importance.

In the construction of harbors, the great desiderata are sufficient depth of water, and perfect security for the vessels likely to frequent them, together with the greatest possible facilities for ingress during any weather; while the chief obstacles to be surmounted are the action of the waves upon the protecting piers and breakwaters, and the formation of sand-banks and bars.

The design of harbors may be classified under the following heads: 1. Harbors of refuge and anchorage breakwaters; 2. Deep water and tidal harbors for commercial purposes; 3. Kanted or curved piers; 4. Straight piers; 5. Quays or wharfs.

These different works are obviously suited for different localities, and for contending with different exposures. The last-mentioned is clearly suited for the most sheltered situations only, and the engineer must consider, when designing a harbor, which of all those will be most economical and effective. In judging of this, the geological features of the coast must be carefully considered. A good chart furnishes valuable evidence as to the forces to which harbor-works will be exposed. Among those may be noted the *line of maximum exposure*, or the greatest fetch or reach of open sea in front of the harbor. Mr Thomas Stevenson, civil engineer, has proved by observations that *the waves increase in the ratio of the square root of their distances from the windward shore* as measured along the line of exposure, and he gives the following simple formula: Where h = height of wave in feet during a strong gale, and d = length of exposure in miles for distances of say 10 miles and upwards:

$$h = 1{\cdot}5\sqrt{d}.$$

The heights so obtained will be increased when they pass into confined channels, and decrease when they pass into expanding channels. The greatest measured height of the waves was by Scoresby in the Atlantic Ocean, where he found billows of 43 feet in height from hollow to crest, and 86 feet was not an uncommon height. At Wick, Caithness-shire, waves of about 40 feet strike the breakwater.

The greatest recorded forces exerted by the waves are the following: A mass of 18 tons was broken or quarried out of its position *in situ* on the Skerries of Whalsey, in Zetland, at a level of 74 feet above the sea; but the most astonishing feat of which we have any knowledge was at Wick breakwater, where, in the winter of 1872, a mass of masonry, concreted together as a monolith, and bound with iron bars 4½ inches in diameter, and weighing no less than 1350 tons, was torn from its seat in the work, and thrown to leeward, where it still lies in an unbroken state.

Mr Thomas Stevenson, by means of an instrument called the Marine Dynamometer, has ascertained *numerically* the force which is exerted by the waves in the Atlantic and German Oceans, and has found that the mean of observations during winter was more than three times that exerted during summer, the maximum force recorded being 3½ *tons per square foot*.

Various local causes materially affect the height, and therefore the force of the waves. In some cases, where a strong current sets off the coast, as at Sumburgh Head roost, in Zetland, it causes a dangerous breaking sea, and while this roost or

Digitized by Google

race continues to rage, the coast under lee is comparatively sheltered; but when the force of the tide is exhausted, and the roost disappears, a heavy sea rolls in upon the shore.

It is this encounter between the ground-swell of the ocean and the current of tide or land water, which causes miniature races at the mouths of rivers. Another most material element in the question of exposure is the depth of water in front of the harbor; for if that depth be insufficient to admit of the propagation of the waves, they break or spend themselves before they reach the piers. Thus, Mr Leslie found at Arbroath harbor that the works were not so severely tried by the heaviest waves as by others of lesser size which were not tripped up and broken by the outlying rocks. In the same way at the river Alne, the harbor within the bar is more disturbed by ordinary waves than during great storms. It thus appears that the largest waves are not always so destructive as smaller ones. Mr Scott Russell has stated the law, that waves break whenever they come to water as deep as their own height; so that 10 feet waves should break in 10 feet water, and 20 feet waves in 20 feet water. There seem, however, to be some waves which break on reaching water whose depth is equal to twice their own height. Proofs of the depth to which the surface undulations extend have been given by Sir George Airy, Sir John Coode, Captain Calver, and Mr John Murray, C.E. The late Dr Rankine has shewn that the crest and trough of the sea are not, as was generally believed, equi-distant from the level of stagnant water. When l is the length of the wave, H its height from trough to crest,

$$\text{Crest above still water} = \frac{H}{2} + \cdot 7854\frac{H^2}{l}.$$

$$\text{Trough below still water} = \frac{H}{2} - \cdot 7854\frac{H^2}{l}.$$

There is much difference of opinion among engineers as to the best profile or cross-section of breakwaters for deep-water harbors. It is asserted by Colonel Jones and others, that in deep water the waves are purely oscillatory, having no power of translation, and therefore incapable of exerting any force against the masonry. This, however, is incorrect, and calculated to lead to dangerous consequences. Were there no wind propelling the waves, and no current to interfere with their character, such a result might be true. This, however, is not the case, and all sea-works, in whatever depth of water they may be placed, will assuredly have to withstand impulsive action. Besides, it must be kept in view, that in order to reduce the expense of construction, it is essential, where the bottom is soft, to make the foundation a pile of loose rubble, or concrete blocks. It follows, from what has already been said, that the rubble, by shoaling the water in front of the work, will cause the waves to become waves of translation before they reach the vertical superstructure, which, assuming the waves to have been simply oscillatory, would have reflected them without breaking, and therefore without their having exerted an impulsive force upon the masonry.

There is, however, no fixed rule as to the profile of any sea-work, which must necessarily depend upon a variety of local peculiarities, such as the nature of the bottom, and the size and quality of the materials. While a long, sloping breakwater does not offer the same amount of resistance to the waves, neither is it in itself so strong, for the weight resting on the face-stones is decreased in proportion to the sine of the angle of the slope. On the other hand, the tendency of the waves to produce horizontal displacement, supposing the direction of the impinging particles to be horizontal, is proportional *to the cube of the sine of the angle of elevation of the wall.*

In tidal harbors, or those in shoal-water, it is admitted by all that the waves break, and therefore exert an impulsive force. Such works have to withstand (1.) The direct horizontal force which tends to remove the masonry; (2.) The vertical force acting upwards on projecting stones or protuberances, and against the lying beds of the stones; (3.) The vertical force acting downwards upon the talus wall, or passing over the parapet and falling upon the roadway; and (4.) The back-draught, which is apt to remove the soft bottom in front of the work.

Digitized by Google

In designing the ground-plan of harbors, some rules should be kept in view; (1.) The entrance should be always kept seawards of the works of masonry; (2.) Long straight piers are not so safe as those of horizontal curvature; (3.) There should be a good "loose," or point of departure free of rocks or a lee shore; (4.) The relation of the width of entrance to the area of a harbor should be a matter of careful study, as upon this depends the tranquillity of the interior, or what has been called the reductive power of the harbor. Mr Stevenson's formula for the reductive power is as under: H = height of wave at entrance; b = breadth of entrance; B = breadth of harbor at place of observation; D = distance from mouth of harbor to place of observation; x = reduced height of wave at place of observation.

$$x = \frac{H\sqrt{b}}{\sqrt{B}} - \frac{(H + H\frac{\sqrt{b}}{\sqrt{B}})\sqrt[4]{D}}{50}.$$

The late Mr J. M. Rendel's plan of depositing rubble from open stages of pile-work is now universally used in the construction of deep-water piers. Sir J. Hawkshaw's method, adopted at Holyhead, consists of huge, irregular, undressed masses, set in hydraulic mortar, and resting upon *pierres perdues*.

The commercial value of a harbor increases, according to Mr Stevenson, not simply as the depth of the water is increased, but as *the cube of the depth*. Hence the great expense which is willingly incurred for securing even a foot or two of additional depth. The greatest feat in deepening is at the Tyne, where Mr Ure, C. E., dredged out the channel to 20 feet at low-water all the way up to Newcastle. Scouring is also employed for increasing the depth, as by Sir. W. Cubitt at Cardiff, where 2500 tons of water a minute are let off. The late Mr Rendel's scheme for Birkenhead was based simply on the quantity liberated and the sectional area of the channel, and was therefore operative for any distance, and did not depend on the propelling head, or on the direction in which the water left the sluices, which conditions regulate ordinary scouring on the small scale, and which is efficacious for only short distances from the outlet.—Docks (q. v.) of various kinds are connected with harbors.

Pine timber is admirably adapted for soft soils, when the exposure is not great, but owing to the ravages of the *Teredo navalis* and *Limnoria terebrans* in localities where there is no admixture of fresh water, it is soon destroyed. Greenheart, African oak, and bullet-tree are little affected by the worm, as shown by experiments made in 1814 at the Bell Rock by Mr. Robert Stevenson. Even limestone and sandstone are perforated by the Pholades and Saxicavæ. Metals also suffer from chemical action when immersed in salt-water. Mr. George Rennie's experiments shewed that wrought-iron resists this action better than cast in the ratio of 8 to 1; while Mr. Mallet's experiments shew that from 1-10 to 4-10 of an inch in depth of castings 1 inch thick, and about 6-10 of wrought-iron, will be destroyed in a century in clean salt-water. A cannon-ball 4½ inches in diameter became oxidised to the extent of ¼ of an inch in the century. The use of Portland cement may be regarded as the most important of recent improvements in harbor construction. Blocks of any size can be formed of sand, gravel, or stones, mixed with cement in the proportion of 1 of cement to 9 of the other materials. This will set readily in still water, and in a week will be nearly as hard as any ordinary sandstone. Sea walls of cement work can also be built continuously, so as to constitute a single monolithic mass.

Reference may be made to Sir J. Rennie's book on "Harbors," to that of Mr Thomas Stevenson on the same subject, and to the Minutes of Institution of Civil Engineers, *passim*.

HARBORS, or Ports, in Law. In England, as well as Scotland, the right to erect and hold ports and havens is vested in the crown. Nevertheless, this right may legally exist in the subject, provided the latter can prove that he has a charter or grant from the crown, or has exercised the right from time immemorial, which presumes a charter or grant. But even though an individual has a right to a particular port or harbor, he holds it charged with or subject to the right of the public to make use of it. The crown has also the superintending power of opening and shutting

Digitized by Google

ports for the purpose of prohibiting the importation or exportation of goods. It is also a settled maxim that the duties or tolls exacted should be reasonable and moderate. In England, the grantee of a port is presumed to be bound to repair it; but in Scotland, this obligation only extends to compel the owner to apply the dues towards repairs so far as they will go.

In most cases, the powers of the common law have been insufficient to regulate the progressive wants of the public as regards harbor accommodation; and various acts of parliament have been passed for the purpose of authorising harbors to be constructed, or extended and improved, and for exacting dues or tolls for the purpose of repaying the expenses. In 1847, a general Consolidation Act (10 Vict c. 27) was passed for the United Kingdom, providing a code for the regulation of the procedure and conduct of all bodies, commissioners, &c., charged with making and improving harbors, docks, and piers. The duties of such bodies are there defined in all their details, as well as the mode of levying and collecting the tolls. The act was amended in 1861. Various local acts are also from time to time passed to meet the peculiar wants of localities. The principle of all these acts is, that the commissioners are empowered to make the works, and, by way of paying for the expense, to levy a small toll on those who use the harbor.

HA'RBURG, an old town and rising seaport of Hanover, in the province of Luneburg, is situated four and a half miles south of Hamburg, on the southmost branch of the Elbe, in a marshy district at the foot of a wooded chain of hills. It is surrounded with walls, and has a fortified castle. Sugar refining and tanning are extensively carried on, as well as manufactures of woollens, linens, and hosiery. Its transit-trade with Hamburg and the countries south of the Elbe, which has long been considerable, has recently received a favorable impetus by the construction of the Hanover and Harburg Railway, and by the deepening and enlarging of its harbor, which can now accommodate 500 vessels, and admits of landing cargoes at the wharfs. The passenger-traffic between H. and Hamburg is carried on by steamers, of which from four to six arrive and depart daily. H. is a place of holiday resort for the Hamburgers. Pop. (1871) 16,506.

HARD LABOR, an addition often made to the punishment of offences besides mere imprisonment. This practice is said to have been introduced by the statute of 5 Anne, c. 6. It is now firmly established in the United Kingdom; and by express statute the power of adding hard labor to the punishment of imprisonment, has been given in most cases, both as to indictable offences and the more disgraceful offences which are punishable summarily. The kind of labor is prescribed by the rules of the jail or prison, where provision must be made of the proper materials for the purpose. Picking oakum, working the tread-mill, &c., form part of this labor; and in general, the number of hours for such labor, unless in case of sickness, is ten hours daily.

HARDENBERG, Friedrich von, better known by his literary pseudonym of NOVALIS, was the son of Baron von Hardenberg, and was born at the family residence in Prussian Saxony in 1772. His father, then director of the Saxon salt-works, was a man of a religious disposition, and a member of the Herrnhut communion, while his mother is described as a "pattern of noble piety and Christian mildness." Young H. inherited the serious and reverential nature of his parents. He studied at Leipsic and Wittenberg. After a brief life, made beautiful by love, friendship, study, and literary activity, he died of consumption, 19th March 1801, in the arms of his friend, Friderich Schlegel. His chief works are "Lehrlinge zu Sais" (Disciples at Sais); a Physical Romance, "containing," says Carlyle, "no story or indication of a story, but only poetised philosophical speeches, and the strangest shadowy allegorical allusions;" "Heinrich von Ofterdingen," intended, as he himself informs us, to be an "apotheosis of poetry," but which he was not spared to finish; and "Hymnen an die Nacht" (Hymns to the Night). "H.," says Carlyle, "is the most ideal of idealists." A profound, beautiful, but indefinite aspiration breathes through all the fragments he has left us. What he lacks is force, activity, and common-sense vigor of understanding. H. belonged to the romantic school of German literature, but he took no part in the controversies of his friends. His "Sämmtliche Schriften" were published in 1802 (5th ed. 1837) by Tieck and F. Schlegel, the former of whom prefixed a biography. See Carlyle's "Miscellaneous Essays."

HARDENBERG, Karl August, Prince Von, a Prussian statesman, was born at Essenroda, in Hanover, May 31, 1750. He was educated at Leipsic, Göttingen, and Metzau, and during 1770—1773, traveled in Germany, France, Holland, and England. On his return to Hanover, he became privy-councillor of the exchequer, and was raised to the rank of count; but a quarrel with the Prince of Wales, originating in a matter deeply affecting his honor, induced him, in 1782, to quit the service of the Hanoverian government. He now repaired to the court of Brunswick, where the duke appointed him, in 1787, president of the council of state. He was also commissioned by his master to convey the will of Frederick the Great, which had been deposited in the duke's hands, to the new king, Frederick-William, who received him with marked distinction. In 1790, the markgraf of Anspach and Baireuth having requested the Prussian monarch to furnish him with a person competent to administer the affairs of his dominions, Frederick-William recommended Hardenberg. After Anspach and Baireuth were united with Prussia in 1791, H. was appointed a Prussian minister of state, and a member of the cabinet ministry. At the commencement of the war with France, the king summoned him to his headquarters at Frankfurt-on-the-Maine as administrator of the army. Early in 1795, he was sent to Basel, where, on the 5th April, he concluded a peace between Prussia and the French republic. On the accession of Frederick-William III. in 1797, H. was recalled to Berlin, and was intrusted with the management of all foreign affairs. In 1804, he became first Prussian minister on the resignation of Haugwitz, and in this capacity endeavored to preserve neutrality between France and England. But when the French troops attacked Anspach, he changed his policy, and addressed a strong remonstrance to Marshal Duroc. After the victory of Napoleon at Austerlitz, Prussia was compelled to enter into arrangements with Napoleon, H. was deprived of his office, and Haugwitz, who was friendly to the French, returned to power. In 1806, Prussia was again led to declare war, and after the fatal battle of Jena, H. accepted for some time the portfolio of foreign affairs at the desire of the Emperor Alexander. In 1810, he was appointed chancellor of state. Prussia was at this period in a deplorable condition, humbled in the very dust before France; nevertheless, H. was sagacious enough to perceive that the power of Napoleon was on the wane. He labored ardently to create a national feeling—a patriotic thirst for revenge. The victories of the British troops in the Spanish peninsula, and the disasters that overwhelmed in ruin Napoleon's vast army in Russia, greatly assisted him in his efforts, and he had the satisfaction of beholding them crowned with success. His exertions were unwearied; he subscribed to the Peace of Paris, June 1814; and was soon after raised to the rank of prince by his sovereign. He accompanied the allied sovereigns to London, took part in the proceedings of the congress at Vienna, and in the treaties of Paris (1815). In 1817, he reorganised the council of state, of which he was appointed president. He was also present at the congresses of Aix-la-Chapelle, Carlsbad, and Vienna, and drew up the new Prussian system of imposts. During a tour through the north of Italy, he was taken ill at Pavia, and died at Genoa, 26th November, 1822. The services rendered by H. to his country were undoubtedly great; to him Prussia is mainly indebted for the improvements in her army system, the abolition of serfdom, of the privileges of the nobles, and of a multitude of trade corporations, besides the complete reform of her educational system. The MSS. of his memoirs of the period from 1801 to the peace of Tilsit, were sealed up by Frederick William III., who deposited them in the archives of the state, and forbade them to be opened before the year 1850. See Von Ranke's "Denkwurdigkeiten des Fursten von H." (4 vols. 1877).

HA'RDERWIJK, a small seaport and fishing-town of the Netherlands, in the province of Guelderland, is situated on the eastern shore of the Zuider Zee, 21 miles east of Amsterdam. It is fortified after an ancient fashion. It has a harbor, but only fit for fishing-boats and small trading vessels. There is accommodation for 1000 soldiers. Pop. (1875) 6419.

HARDICANUTE, king of England, son of Canute the Great by Emma of Normandy, the widow of Ethelred II. At the time of his father's death H. was in Denmark, and the throne of England was usurped by Harold his younger brother, Emma, however, preserving her son's authority over Wessex. In this state matters remained for some time, till Alfred, Emma's younger son by Ethelred, invaded the

Digitized by Google

kingdom; but the invaders being annihilated by Earl Godwin, Harold's general, Emma was obliged to seek refuge at Bruges, whence she sent to H. to acquaint him with the state of affairs in England. H. being of an easy and self-indulgent disposition, allowed two years to pass before taking any steps to assert his rights. Roused at last by his mother's remonstrances, he, in 1039, equipped a fleet and army, and was about to sail for England to dispossess the usurper, when he was met by a deputation of English nobles, who informed him of the death of Harold, and offered him the crown. H. reigned in England till 1042, when, after a quiet reign, he died of apoplexy, induced by his gluttonous habits. With H. ended the Danish line in England.

HARDING, Stephen, the third abbot of the celebrated monastery of Citeaux, and one of the most remarkable religious reformers of the 12th century. Of his parentage and youthful history, little is known beyond the fact that he was of a noble English family, and in early life a soldier. Under one of those religious impulses which so frequently occurred in the middle ages, he undertook a pilgrimage to Rome. He subsequently entered the French monastery of St Claude de Joux, where he was so distinguished by his strict and exemplary life, that he was chosen abbot of the monastery of Bèze, with a view to the reformation of its discipline, which had become much relaxed. From this monastery he was transferred to that of Citeaux, where, on the death of Alberic in 1109, he was elected abbot. The rigor of observance which he here enforced had such an effect in deterring novices from entering the new order, that at first grave fears were entertained for its stability; but Stephen, placing his trust in the good cause which he had undertaken, persevered in the cause of reform; and he was rewarded, in 1113, by the accession of St Bernard and thirty other youths, whose eminent virtue gave such an impulse to the institute, that in a short time the number of claimants for admission compelled him to found several new convents, and especially that of Clairvaux, which, under the rule of St Bernard, attained to the very highest distinction in that age. Abbot Stephen continued, till his death in 1134, to direct the fortunes of the Cistercian order; and in 1119, he drew up, in conjunction with St Bernard and other members of the brotherhood, the well-known constitutions of the order, entitled "Carta Caritatis," which were approved by Pope Calixtus II. and Eugenius III., and, with some modifications, have continued down to modern times, as the rule of the Cistercian institute. See "Mabillon Annal. Benedictin" t. V. p. 205.

HARDINGE, Viscount (Henry Hardinge), field-marshal and commander-in-chief of the British army, the third son of the Rev. H. Hardinge, rector of Stanhope, in the county of Durham, was born March 30, 1785, and was gazetted as ensign before he had attained his 15th year. He obtained a brigade command before his 25th year, and his foreign grade was commuted shortly afterwards for British rank, after which he was attached to the Portuguese army from 1809 to 1813, in the capacity of deputy quartermaster-general. When Napoleon effected his memorable return from Elba, H. joined the allied armies in Belgium, and was appointed by the Duke of Wellington commissioner at the Prussian headquarters. He lost his hand at Ligny, and was thus unable to participate in the crowning victory of Waterloo. In 1826 he entered parliament, and in 1828 succeeded Lord Palmerston in the government of the Duke of Wellington as secretary at war. He next filled the office of secretary of Ireland. In 1844 he accepted the high post of governor-general of India, which he filled until 1847. When the great Sikh war broke out, he hurried to the north-western frontier of India and served as second in command under Lord Gough during the sanguinary and hard fought battles of Moodkee, Ferozeshah, and Sobraon. After the pacification of Lahore his services were rewarded by a viscounty, the East Indian Company granting him a pension of £5000, and parliament voting him an annuity of £3000 for himself and his next two successors. On the death of the Duke of Wellington in 1852, H. was appointed commander-in-chief of the British army, a distinguished post which he filled during the eventful epoch of the Russian war, and which he only resigned a few months before his death. In October 1855 he was advanced to the rank of field-marshal. He died September 24, 1856, at his seat, South Park, near Tunbridge, Kent.

HARDNESS, Scale of. The hardness of a body is measured by its power of scratching other substances. Variations in the degree of hardness presented by

Digitized by Google

differ ... crystallised bodies often furnish a valuable physical sign by which one mineral may be readily distinguished from others closely resembling it. Mohs selected ten well-known minerals, each succeeding one being harder than the preceding one, and thus formed the *Scale of Hardness*, which has been generally adopted by subsequent mineralogists. Each mineral in the following table is scratched by the one that follows it, and consequently by all the subsequent ones, and the hardness of any mineral may be determined by reference to the types just selected. Thus, if a body neither scratches nor is scratched by felspar, its hardness is said to be 6; if it should scratch felspar but not quartz, its hardness is between 6 and 7—the degrees of hardness being numbered from 1 to 10. The figures on the right indicate the number of known minerals of the same or nearly the same degree of hardness as the substance opposite to which they stand:

SCALE OF HARDNESS OF MINERALS.

1. Talc	23	6. Felspar (any cleavable variety)	26
2. Compact gypsum, or rocksalt	90	7. Limpid quartz	26
3. Calcspar (any cleavable variety)	71	8. Topaz	5
4. Fluor-spar	53	9. Sapphire, or Corundum	1
5. Apatite	43	10. Diamond	1

The cause of the varieties of hardness observed in different bodies is not known. The same substance—as, for example, a piece of steel—may, under the influence of different circumstances, be so soft as to take impressions from a die, or may be nearly as hard as a diamond.

HARDOUIN, Jean, was born in 1645 at Quimper, in Brittany, where his father followed the trade of a bookseller. H. received his first education in the schools of the Jesuits, and being received into that order at the age of 20, completed his studies in Paris. On the death of Père Garnier in 1683, H. was appointed librarian of the college of Louis le Grand, in which office he enjoyed full leisure for the literary pursuits in which he delighted, and in which his extravagances have acquired for him a notoriety almost without any parallel in the annals of literary eccentricity. Dupin places him among the very first scholars of his learned brotherhood. In a spirit of literary scepticism which it is difficult to look upon as serious, he maintained, not only that the entire body of classical literature, with the exception of in Latin, Pliny's "Natural History," Virgil's "Georgics," the comedies of Plautus, and Horace's "Satires," and in Greek, Homer's "Iliad," and Herodotus's "History," was falsely ascribed to the authors whose various names it bears, but that it was all the production of the monks of the 13th century! In the same sceptical spirit, he rejected as spurious all the reputed remains of ancient art, together with the inscriptions and coins which are attributed to classical times; nay, he extended the same scepticism to the Septuagint version of the Old Testament, and even to the Greek text of the New, the original language of which he held to have been Latin! Opinions so extravagant naturally called forth the reprobation of the authorities of his order. He was required to retract them; and there is some reason to believe, that they were put forward by him rather from a love of paradox and a morbid desire of notoriety, than from any serious conviction of their probability. Nevertheless, with all this extravagance, the erudition of Père H. was beyond dispute, and most of his works are of great historical and critical value. His edition of Pliny (5 vols. 4to, Paris, 1689) is a prodigy of learning and industry. Of his remaining works, the most valuable is his great "Collectio Conciliorum" (12 vols. folio), a work of great learning and utility, which has the rare advantage of possessing one of the best indexes extant; a commentary of the New Testament in folio; several volumes on the study of numismatics and chronology; and a vast number of dissertations and essays in the "Mémoires de Trevoux." He died at the age of 88, in the convent of his order in Paris September 3, 1729.

HARDWARE, a commercial term applied to the commoner articles made of iron, copper, or brass, such as locks, keys, anvils, grates, shovels, &c. The great hardware manufactures of this country are at Birmingham, Wolverhampton, Walsall, Willenall, Sheffield, &c. The extent of the trade of these places is enormous; the value of the exports of hardware alone amounting to millions. The returns for the year 1875 give for hardwares, including cutlery, £4,265,451. See IRON.

HARD-WOOD TREES are forest-trees of comparatively slow growth, producing compact, hard, and valuable timber, as oak, ash, elm, chestnut, walnut, beech, birch, &c. From these, willows, elders, poplars, &c., are distinguished as *soft-wood trees*. Neither term is extended to firs, pines, cedars, or other coniferous trees, the wood of which is of a peculiar and very different character.

HARE (*Lepus*), a genus of rodent quadrupeds, of which there are many species very similar to each other. The Linnean genus *Lepus* now forms the family *Leporidæ*, which includes the general *Lepus* and *Lagomys*, and of which a peculiar characteristic is the presence of two small incisors immediately behind the ordinary rodent incisors of the upper jaw, so that these teeth seem to be double. The molar-teeth, six on each side above and five below, and transversely grooved, being formed of two vertical plates soldered together. All the animals of this family feed exclusively on vegetable food, and chiefly on herbage, although they are also fond of grain, roots and the bark of trees. Their fore-feet have five toes, their hind-feet four; the soles are hairy. Their fur is soft; the colors mostly gray or brown, the alpine and arctic species becoming white in winter—The COMMON H. (*L. timidus*) is widely distributed over Europe and the northern and central parts of Asia. The IRISH H. (*L. Hibernicus*) has, however, recently been described as a distinct species. It differs from the common H. in its rounder head, shorter ears, and shorter limbs; also in having the fur composed only of one kind of hair, short and soft, with none of the long, black-tipped hairs which are mixed with this in the common species. The fur, therefore, is of no value. The common H. is not found in Ireland. Notwithstanding the character of timidity usually ascribed to the H., it is really a pugnacious animal, and displays no little courage in encounters with those of its own race, or with animals of nearly equal powers. It has been an object of the chase from a very early period. Xenophon, in his "Cynegeticus," gives an enthusiastic description of the sport. Concerning the hunting of the H., see COURSING. Being evidently designed to seek safety from enemies by fleetness, the H., however well supplied with food, never becomes fat. It ordinarily lies quiet in its *form* during the day, and goes in quest of food in the evening and morning. Where, through game preserving, it is abundant, it does no little damage to crops. It is a prolific animal, although not nearly so much so as the rabbit. The female produces from two to five at a birth. The young (*leverets*) are born covered with hair, and with the eyes open.—The VARYING H. or ALPINE H. (*L. variabilis*) which inhabits the mountains both of the north and south of Europe, and is found on those of Scotland and of Cumberland, is remarkable for the change of color which it undergoes, without change of hair, on the approach of winter. Ordinarily of a bluish-gray color, it becomes of a shining white, the change beginning with the feet, and extending upwards, terminating with the back. This, which in many places is called the *Blue* H., is about equal in size to the common H., but has shorter limbs and ears, and is less swift.—In the arctic regions both of the Old and New Worlds, the ARCTIC H. or POLAR H. (*L. glacialis*) abounds. It is entirely white in winter, brownish-gray in summer, has long soft fur on the belly, and fine thick fur on the back; is considerably larger than the common H., and spends the whole year without hybernation, even in Melville Island and similar cold desolate regions; lichens and mosses probably affording it the greater part of its food.—North America produces a number of other species of H., of which some inhabit the swamps of the southern states.—India has a H. (*L. ruficaudatus*) very similar to the common H.; other species are found in other parts of Asia, Egypt, the Cape of Good Hope, &c. The fur of the H. is used for felting for making hats and other purposes.

HARE, in point of English law, is one of the wild animals called Game (q.v.), and is specially protected by the game-laws for the benefit of the owners of land. There is no close season as to hares, which may therefore be lawfully killed by a licensed sportsman all the year around. Being game, hares can only be bought from a licensed dealer, and sold by licensed persons. The owner of enclosed land, and also the tenant, if otherwise entitled by his lease to kill hares, may do so without a license. So those who hunt them with greyhounds or beagles require no license. All others require a license. To kill hares unlawfully by night in a warren, or place kept for breeding hares, is now a misdemeanor by 24 and 25 Vict. 96, s. 17; to kill them elsewhere, is only a misdemeanor when the third offence is committed.

Digitized by Google

In Scotland, the law is substantially the same, except that the killing of hares unlawfully by night is only an offence punishable summarily, unless it is a third offence, when it becomes indictable. In Ireland, there is a close season, when hares cannot be killed—viz., between the first Monday in November and the first Monday in July following. See Paterson's "Game-laws of the United Kingdom."

HA'RELD (*Harelda*), a genus or sub-genus of ducks of the oceanic section (see DUCK), nearly allied to pochards, scaups, &c.; having a short, thick bill, high at the base, the laminæ projecting at the edge of the mandibles, a high forehead, a thick neck, and two feathers of the middle of the tail in the males greatly elongated; whilst the females have the tail short and rounded.—The LONG-TAILED DUCK, or H. (*H. glacialis*), inhabits the arctic regions both of the old and new worlds, remaining on the seas of the north as long as any water remains unfrozen, and then betaking itself to more southern regions. It is plentiful, during winter, in the inlets of Orkney and Shetland, but is rather rare in the southern parts of the British Islands. It is sometimes brought to the London market. Its winter migrations in America extend as far south as Texas. The male, particularly in its summer plumage, is a very beautiful bird. It is about 17 inches long, without the long tail-feathers; with them, 23 or 24. It is a very lively and noisy bird; flies swiftly, and is a most expert diver. It lines its nest with down, which is said to be equal to that of the eider, but has not yet become an article of commerce.

HAREBELL, or Bluebell (*Campanula rotundifolia*), the most common of all the British species of Bellflower (see CAMPANULA), growing abundantly in dry and hilly pastures, on waysides, &c.; flowers in summer and autumn. It is common in most parts of Europe, and even to the extreme north. It is everywhere a favorite from its beauty and gracefulness, and is the subject of many allusions in poetry. It is a perennial plant, with a slender stem 6—14 inches high, sometimes bearing only one flower, but more generally a loose panicle of a few drooping flowers, on very slender stalks; the flowers sometimes white, but generally bright blue, bell-shaped, and fully half an inch long. The juice of the flowers yields a fine blue color, and may be used as ink.

HARE'S-EAR (*Bupleurum*), a genus of plants of the natural order *Umbelliferæ*, having compound umbels of yellow flowers, and generally simple leaves. The leaves of the most common British species, *B. rotundifolium*, embrace the stem and are roundish oval. This plant, which grows in cornfields in the chalk districts, is the *Thorough-wax* of the old herbalists, and was once in repute as a vulnerary, but has fallen into disuse. The species of H. are numerous, and are natives of temperate climates in most parts of the world.

HARFLEUR (called in the middle ages *Harefleet*), a small town of France, in the department of Seine-Inférieure, is situated near the mouth of the Lézarde, on the northern bank of the Seine, about four miles east of Le Havre. The chief building is a beautiful Gothic church with an elegant tower, built by the English as a memorial of the victory of Agincourt. Pop. 1800, who are employed in fishing and the rearing of cattle. In former times, before the rise of Havre, H. was a flourishing town, and was the key to the entrance of the Seine. Its harbor now forms a meadow. It was taken by the English under Henry V. in 1415, retaken by the French in 1433; in 1440 it was again seized by the English, and ten years after was recaptured by Charles VII. of France. Off this town the Duke of Bedford took or destroyed nearly 500 French ships, August 15, 1416.

HARGREAVES, James, whose name will ever be remembered in connection with the cotton manufacture of this country, as the inventor of the carding-machine, and the spinning-jenny, was an artisan at Stanhill, near Blackburn, where he was born. H. was an illiterate man, and supported himself and family by weaving and spinning, carried on in his own house, according to the custom of the time. In 1760, he invented the carding-machine, as a substitute for the use of hand-cards; and four years later, he produced the spinning-jenny. H. had frequently tried to spin with two or three spindles at once, holding the several threads between the fingers of his left hand, but the horizontal position of the spindles frustrated his attempt. One of his children, however, is said to have upset the spinning-wheel while he was at work, and as he retained the thread in his hand, the wheel continued revolving

Digitized by Google

horizontally, and the spindle vertically. The observation of these motions produced the thought, that if a number of spindles were placed upright, and side by side, many threads could be spun at once. H. now put his idea into practice, and the result was the *jenny*, at which he and his family worked, till the large amount of cotton which they spun having excited suspicion, his fellow-spinners, imbued with strong prejudices against machinery, broke into his house, and destroyed his frame. He then removed to Nottingham in 1768, where he erected a spinning-mill. Two years later, he took out a patent for his machine; and discovering that it was in use by manufacturers in Lancashire without his permission, brought an action for £7000 damages. Pending the trial, he was offered by a company £3000 for the use of the jenny, but refused; and it having been proved that he had sold some of his machines before the patent was obtained, it was thereby declared to have been invalidated, and his claim for compensation fell to the ground. Thus the inventor was but little benefited by his work. H. continued to carry on business as a yarn manufacturer, in conjunction with a Mr Jones, with moderate success, till his death in April 1778, when his share in the mill was bought by his partner for £400. His country never gave H. any reward for the invention to which so much of its wealth is due; yet it is but just to the memory of the Sir Robert Peel to state, that one of his last acts as a British minister, was to bestow on the youngest and only surviving daughter of this inventor, the sum of £250 from the Royal Bounty Fund.

HARIKARI. See HARRI-KARI.

HÄRING, Wilhelm, better known under the name of WILIBALD ALEXIS, a German novelist, was born at Breslau in the year 1798. He was educated in Berlin, and served as a volunteer in the campaign of 1815. He afterwards studied law at Berlin and Breslau but abandoned this pursuit for a literary career. After several poetical and other literary efforts, H. first made himself known over all Germany and abroad by his romance of "Walladmor" (2d edit. 1823—1824), written in consequence of a wager with a friend that he would produce a work which should be mistaken for one of Sir Walter Scott's. "Walladmor" was a most audacious mystification, and was greedily devoured in Germany as a production of the Scottish novelist. It was translated into various languages, among others into English by Thomas de Quincey (London, 1824), whose translation, however, departed so widely from the original, that it hardly deserved the name. H. likewise wrote several admirable tales, but his chief excellence is displayed in the field of historical romance. His "Cabanis" (6 vols. 1832), notwithstanding many defects, may be regarded as his best work; "Roland von Berlin" (3 vols. 1840); "Der falsche Waldemar" (3 vols. 1842); "Hans Jürgen und Hans Jochem" (2 vols. 1846); "Der Wärwolf" (3 vols. 1848); and "Rushe ist die erste Bürgerpflicht" (5 vols. 1852), may likewise be classed among the first specimens of the historical romance in the German language. He died in 1871.

HARIRI, Abu Mohammed al Kasim ben Ali, a most celebrated Arabic philologist and poet, born at Bassorah, on the Tigris, in 446 H. (1054 A.D.). Little is known of his life and circumstances, save that he was the son of a silk-merchant (whence his name Hariri—*harir*, silk). H. wrote several valuable grammatical works, and his lyrics are of a high order. But the most famous of all his writings, and indeed one of the most famous compositions of all times and countries, is his book entitled "Makamehs" (Sittings). This may best be described as a novel, or a collection of rhymed tales, loosely strung together, the centre of which is always a certain Abu Seid from Seruj, who, witty, clever, amiable, of pleasing manners, well read in sacred and profane lore, but cunning, unscrupulous, a thorough rogue in fact, turns up under all possible disguises, and in all possible places—sermonising, poetising, telling adventures and tales of all kinds—always amusing, and always getting money out of his audience. The brilliancy of imagination and wit displayed in these strange adventures, their striking changes, and dramatic situations, have hardly ever been equalled; but more wonderful still is the poet's power of language. The whole force of the proverbial fulness of expression, spirit, elegance, and grandeur of the Arabic idiom, H. has brought to bear on his subject. His work—of which one of the greatest Arabic authorities has said that it deserved to be written in gold—has indeed become the armory as well as the mine of all Arabic writers since his day. Poets and historians, grammarians and lexicographers, look upon the "Makamehs"

Digitized by Google

as the highest source of authority, and next to the Koran, as far at least as language is concerned. His book has been translated either entirely or partially into nearly every Eastern and European tongue, has been the prototype of innumerable imitations, the most successful of which is the one in Hebrew, "Tachkemoni," by Jehuda Al-Charisi. The first complete edition of the text appeared in Calcutta, 1809—1814, in 3 vols.; another by Caussin de Perceval, in Paris, 1818; one much more valuable, chiefly on account of its commentary by Silvestre de Sacy, appeared in Paris, 1821—1822 (re-edited 1847—1853).

The first (Latin) translations in European tongues of single Makamehs were made by Golius (1656) and Schultens (1731, &c.). But the palm of all translations is due to Rückert, who, with a power only inferior to that of H. himself, has so completely reproduced the spirit and form of the work in German in his "Verwandlungen des Abu Seid b. Serug," first published in 1826, that the "Makameh" itself has become a favorite form for similar compositions in Germany. English translations, but which fall far short of the German one, were published in 1767 by Chapellon, and in 1850 by Preston. Munk and De Sacy have rendered some portions into French.

HARISCHANDRA, a Hindu king of the solar dynasty, a descendant of Ikshwâku, and one of the more prominent personages in the legendary history of ancient India. The earliest mention is made of him in the "Aitâreya-Brâhmana (see VEDA), where he is the subject of one of the most interesting legends of the Vedic period. He is represented there as desirous of obtaining a son, and of making a compact with the god Varuna, by which he promised to sacrifice to the god his son, if he granted him one. Varuna acceded to his prayer, and the "Aitâreya-Brâhmana" then proceeds to relate how H. delayed, from time to time, the fulfilment of his part of the compact, until at last he succeeded in finding a substitute for his son in S'unahs'epa, who was sold to him by his father for 100 cows, to be offered in sacrifice to Varuna. Ultimately, however, S'unahs'epa becomes released from his bondage through the intervention of the gods. See S'UNAHS'EPA. According to the epic poem "Mahâbhârata," H. was a type of munificence and piety, and after death became elevated to the court of Indra; and some of the Purânas are still more explicit on his wonderful fate. Having given his whole country, his wife and son, and finally himself to Vis'wâmitra, in satisfaction of the demands made by this greedy priest for his assistance at a sacrifice, H., in consequence of this pious act, became elevated with his subjects to the paradise of Indra; but having been insidiously misled by Nârada to boast of his merits, was again precipitated. The repentance of his pride, however, arrested his downward descent, and he and his train paused in mid-air, where his city is popularly believed to be at times still visible.—See Wilson's translation of the "Vishnu-Purâna."

HARIVANS'A, a Sanscrit epos of some extent which professes to be part of the Mahâbhârata, but may be more properly classed with the Purânas. It is chiefly occupied with the adventures of Vishnu, in his incarnation as Krishna, but treats likewise of the creation of the world, of patriarchal and regal dynasties, and other matter contained in Purânas. Although it is frequently quoted by later writers, it is not a compilation of much reliability. See PURÂNA.

HARLAW, Battle of. From the beginning of the 12th c. to the beginning of the 14th c., the power and territory of the Celtic tribes in Scotland steadily gave way before the encroachments of the Anglo-Normans of the Lowlands. But during the long Wars of the Succession, and the feeble reigns of the first and second Stuart kings, the Celtic people regained so much of what they had lost, that, strengthened by alliances with England, they began to be regarded with alarm by the Scottish government. A trial of strength seemed inevitable, and it was precipitated by a dispute as to the right of succession to the earldom of Ross, between Donald Lord of the Isles and a brother of the Regent Albany. The island chief, gathering a host of 10,000 Islesmen and Highlanders, marched rapidly southwards, leaving havoc and desolation behind him. The rich city of Aberdeen, and the whole country to the north of the Tay, seemed to be within his grasp, when he was encountered by a vastly inferior force of the chivalry and men-at-arms of Mar, Garioch, Buchan, Angus, and Mearns, under Alexander Stewart, Earl of Mar, one of the best captains of the day, familiar in his youth with the usages of Highland warfare, and more recently distinguished in the wars of France and Flanders. The armies met on the

Digitized by Google

Eve of St James (24th July) 1411, at Harlaw, a low table-land on the banks of the Ury, about 18 miles to the north-west of Aberdeen. The battle was long and bloody, but the Highlanders were at last driven back. They left two chiefs, Maclean and Macintosh, and more than 900 dead upon the field. The loss upon the other side was computed at 500 or 600, among whom were the Constable of Dundee, hereditary bearer of the royal banner, Sir Alexander Irvine of Drum, and other knights, many of the best esquires of Angus and Mearns, nearly all the gentry of Buchan, and Robert Davidson, the provost, and many of the burghers of Aberdeen. So obstinate and sanguinary was the struggle, and so greatly were the Lowlanders outnumbered, that few of them escaped without a wound. The conflict made a deep and lasting impression on the national mind. For more than a hundred years, the battle of Harlaw continued to be fought over again by school-boys in their play. For more than two hundred years, it was remembered in the music of the people. It lived still longer in their traditions; and it is not yet forgotten in their poetry. It is the subject of a still popular ballad, written, it would seem, towards the end of the 16th c., printed at least as early as 1668, reprinted in Allan Ramsay's "Evergreen" in 1724, and included in most subsequent collections of Scottish ballads. Scott, in his "Antiquary," has commemorated "the sair field of Harlaw" in a fine fragment of song.
